Communication has been established between the Leafield (Oxfordshire) and the Abu Zabal (Cairo) stations, but no commercial facilities are yet available. In reply to a question in the House of Commons on Tuesday, the Postmaster-General said that experimental transmission had been commenced between the two stations, and as soon as the preliminary trials were completed a public service would be inaugurated. The Leafield station had been working satisfactorily for some months, and its messages were regularly picked up practically all the way by liners on the Australian route. The total cost of the two stations was estimated at £250 000. The cost of the remaining five stations of the Imperial Chain is estimated at £853 000, but without provision for patent royalties.

Business Items, &c.

The business known as the Thanet Electrical Company, 262, Northdown-road, Margate, will in future be known as the Margate & District Electrical Company, Ltd., and will be under the control of Mr. J. M. Keenan.

The Electro-Mechanical Brake Company have received an order, per the English Electric Company, for seventy-five car sets, and per Metropolitan-Vickers Electric Company, for fifty car sets of "E.M.B." unbreakable resistances for above equipments.

Companies' Meetings, Reports, &c.

The Yorkshire Electric Power Company.

The thirtieth ordinary general meeting of the Yorkshire Electric Power Company was held at the Hotel Metropole, Leeds, on Tuesday, Mr. A. Greenhow Lupton, J.P., presiding.

In the course of his remarks, the chairman said :—The year under review has been an anxious one. The dispute in the coal industry came in the first half of 1921, and during three whole months no coal was obtained from the collieries. For this period the use of our current was much reduced owing to the general stoppage of industry. The company's supply was maintained throughout, and was of essential service, though the large reserve stock of coal held by the company had to be supplemented by additional supplies at high prices.

In spite of this three months' set-back, and of the slump which has persisted for the whole year, the output of current has been practically the same as for 1920, which, as you know, was a great increase on any previous record of the company. The company's scale of charges for current are based on a sliding scale, varying with the price of coal, and the great and satisfactory decrease in this charge which has taken place in the latter part of the year has resulted in a reduction of revenue.

On the costs side a still greater reduction has been made, which enables the company to declare the same satisfactory dividend of 8 per cent. on the ordinary shares, after paying interest upon a capital which has been largely increased to meet the growing demands on the company and after putting the same amount as before to reserve and leaving a slightly larger amount to carry forward.

To fulfil our duties to the area it has been necessary to make considerable additions to our mains and to the plant at Thornhill and Barugh, which will bring in proportionate additions of revenue during the present year from customers already connected or contracted with. As the company's business grows, generating machinery of a larger size is brought into use, and with its use there is a substantial saving of coal and other items which affect the cost of electricity. The extensions now in progress at the company's stations should, therefore, not only deal with the increasing demands for electricity, but should also result in substantial saving of cost.

In view of future needs, power is also being asked for the company to double its present authorised capital from £2 000 000 up to £4 000 000, as the money may be required.

The growth of the company will shortly involve the erection of our new station at Ferrybridge and the laying of powerful trunk mains; but I may remind you that, although the first year of supply given by our company was 1905, when the whole revenue for the year was about £1 000, in the sixteen years that have since passed our revenue has grown to very nearly £370 000, that we have now 440 miles of mains, and that every expansion has brought increased revenue and profits to the company.

At subsequent meetings held after the ordinary meeting, the shareholders approved the issue of 111 672 6 per cent. cumulative preference shares of £5 each, the promotion of a Bill in Parliament to convert both the ordinary and preference shares into shares of £1 denomination, and the increase of the capital of the company from two to four millions, with proportionately increased borrowing powers.

North Metropolitan Electric Power Supply Company.

The North Metropolitan Electric Power Supply Company held its annual meeting on Thursday. Mr. E. Garcke, who presided, stated that the net revenue for 1921 reached the record figure of £131 695. With the amount brought forward there was a total of £136 128 at the credit of the net revenue account. There was available for dividends and reserve £101 007, compared with £82 695 for 1920. The directors had placed £25 000 to reserve, and recommended a dividend on the ordinary shares of 10 per cent. for the year, compared with 7½ per cent. for the preceding year, carrying forward £5 006, as compared with £4 433 a year ago. In the course of two years the balance of the company's net revenue had more than doubled, while during the past twelve months, described as a "period teeming with difficulties," there had been a gain of over 20 per cent., and this in spite of the fact of the coal strike. The capital expenditure during the year had amounted to £240 000. This had been mainly in connection with the new generating plant, main transmission lines and distribution mains. The company was affording bulk supplies to eight separate local authorities and companies, who themselves distributed electricity to their consumers. In addition they were operating, in conjunction with their allied distribution company, no fewer than thirteen separate undertakings, and supply was given for power and general industrial purposes to manufacturers of every description throughout the area of supply. The result of the inquiry held by the Electricity Commissioners during the year in connection with the London and Home Counties Electricity District had now been published. Although this company's area would be included in the district of the proposed joint electricity authority, the rights of their company would not be interefered with, and the supply powers of the joint authority within the company's limits of supply would be carried out by the company. Their rights were thus confirmed and their interests safeguarded. During the past year an additional 5 000 kW turbine had been installed, and it was anticipated that a further 15 000 kW of modern and efficient plant would be in service during the present year. Further mains extensions were carried out. During the past year nine new substations had been erected and put into service. Under the Bill which the company was promoting in the present session of Parliament they were seeking powers to revise the methods of charge and prices for electricity, and to take over the undertakings of their distribution company. The report was unanimously adopted.

London, Brighton and South Coast Railway.

Referring to electrification schemes at the annual meeting of the London, Brighton & South Coast Railway Company last week, Mr. C. C. Macrae (the chairman), who presided, stated that the extension of the company's electrical system to the railway from Balham Junction to West Croydon was nearing completion, and it was hoped that this section would be open for electrical traction by Sept. 1. This section, however, formed only a very small part of the scheme submitted to the Minister of Transport, which included the electrification of the whole of the company's suburban area, extending to Coulsdon towards Brighton and to Cheam towards Portsmouth, as well as the equipment of the main lines, with which, in course of time, it was hoped to proceed at any rate as far as Brighton and Lewes. The outlay of capital would, of course, be very considerable, and as the present time was not opportune for raising money, the board had determined for the present to confine electrification to those sections of the suburban system where the needs were greatest.

If they were independent, they could carry out the entire scheme now, but they were hampered by the Railways Act, which had a paralysing effect on independent action. The Act provided that the company should be amalgamated with the London and South-Western, the South-Eastern, and the Chatham and Dover Railway Companies to form the Southern Group, and those companies were given to the end of this year to arrive at an agreement for amalgamation. For some months past communications had been taking place between the companies to endeavour to arrive at terms upon which the details of the amalgamation could be worked out, but at once they were confronted with the contention that no electrification work involving large expenditure should be undertaken by any one of them without the consent and approval of the others. On the surface this appeared perfectly reasonable, but when it transpired that each of these companies had a different system of electrification, and naturally thought its own the best, the result was that the condition placed a distinct veto on their company going ahead with its own programme.

The Scottish Power Company announce a dividend on the ordinary shares of 7 per cent.

Bruce Peebles & Company recommend a dividend on the ordinary shares for the year ended Dec. 31 last at the rate of 10 per cent., less tax, together with a bonus of 5 per cent., less tax.

The Telegraph Construction & Maintenance Company announce a final dividend of 7½ per cent., tax free, for 1921. In July an interim dividend of 2½ per cent. was paid. The dividend for 1920 was the same.

The North Metropolitan Electric Power Supply Company on Monday offered for public subscription £250 000 8 per cent. cumulative second preference stock at par. The issue was over-subscribed in a short time.

Kensington & Knightsbridge Electric Lighting Company recommended a dividend of 6 per cent. on the ordinary shares for the half-year ended Dec. 31, making, with the interim dividend paid in August last, 10 per cent. for the year.

Bournemouth & Poole Electricity Supply Company is paying a balance dividend on the ordinary shares at the rate of 7 per cent. per annum, less tax, for the half year ended Dec. 31, 1921, making 6 per cent. for the year (same as for the previous year).

Charing Cross, West End & City Electricity Supply Company recommend a dividend on the ordinary share capital of the West End undertakings of the company, for the half-year ended Dec. 31, 1921, at the rate of 6s. per share, making, with the interim dividend already distributed, 9 per cent. for the year 1921.

The City of London Electric Lighting Company recommend, subject to final audit, the payment of the following dividends: 7 2d. per share on the 6 per cent. cumulative preference shares, making with the dividend paid in September, 6 per cent for the year ended Dec. 31 last; 9·6d. per share on the 8 per cent. cumulative second preference shares, being 8 per cent. for the half year; 1s. 9·6d. per share on the ordinary shares, making, with the dividend paid in September, 14 per cent. for the year. These dividends are subject to income tax.

The report and accounts of the Westminster Electric Supply Corporation for the year 1921 states that the total power of the lamps, motors and apparatus connected to the company's mains, which on Dec. 31, 1920, was the equivalent of about 56 652 kW, had increased by Dec. 31, 1921, to the equivalent of about 59 132 kW. An interim dividend at the rate of 8 per cent. per annum on the ordinary shares and the dividend on the 4½ per cent. preference shares, for the half-year ending June 30, 1921, have been distributed. After allowing for depreciation, sinking fund and other charges, the balance is £65 036, from which must be deducted the second half-year's dividend on the preference shares, which absorbed £12 375, leaving a balance of £52 661. Out of this the board recommend the payment of a dividend at the rate of 12 per cent. per annum, less income tax, for the past half-year, making 10 per cent. for the year, carrying forward a balance of £7 324.

Tenders Invited and Accepted.

UNITED KINGDOM.

West Hartlepool County Borough. Feb. 27.—Supply, delivery, and erection of material for the electric lighting of fifty houses now in course of erection. Particulars from the Borough Engineer, Mr. W. F. Dennis, Municipal Buildings, West Hartlepool.

Stockton-on-Tees Corporation. Feb. 28.—Extra high-tension, low-tension and pilot cables. Specification from the Manager and Engineer, Electricity Works, Stockton-on-Tees.

Clacton-on-Sea Urban Council. March 1.—900 yards paper-insulated, lead-covered and armoured cable and joint boxes. Specification from the Electrical Engineer.

Metropolitan Asylums Board. March 1.—Electric lighting and power, telephone and fire alarm installations at the Eastern Fever Hospital Extension, Homerton, E. 9. Specifications can be obtained at the Board's offices, Embankment, E.C. 4.

Islington Guardians. March 4.—Six months' supply of electrical supplies for several institutions. Particulars from the Clerk, Mr. A. King, Guardians' Offices, St. John's-road, Upper Holloway, London, N. 15.

Standing Joint Committee of Glamorgan Quarter Sessions and County Council. March 4.—Electric wiring and fitting (Henley system) of Bridgend Police Station and Court, Cilfynydd Police Station and Llanharan Police Station. Specifications can be obtained at the Police Station or at Glamorgan County Hall, Cardiff.

Merthyr Tydfil Guardians. March 5.—Electrical fittings for six months. Particulars from the Clerk, Mr. F. T. James.

St. Pancras Borough Council. March 7.—E.h.t. three-phase switchgear for two sub-stations. Particulars from Mr. C. H. F. Barrett, 57, Pratt-street, Camden Town, N.W. 1.

Wigan Corporation. March 13.—Steam turbine, 5 000 kW three-phase alternator, exciter and surface-condensing plant. Specification, &c., from the Manager of the Electricity Department.

Croydon Corporation. March 14. Crushing plant for house refuse, with conveyers, motors, switchboards, &c. Specification, &c., from the Borough Engineer.

Edinburgh Corporation. March 14.—Steel tramway poles. Specifications, &c., from the Tramways Manager, 2, St. James-square, Edinburgh.

Hampstead (London) Borough Council. March 15.—Supply of various stores for six or twelve months, including electrical engineers' stores and oils for the electricity station. Form of tender, &c., from the Town Clerk.

Blackpool Corporation. March 16.—Supply, delivery and erection of h.t. switchgear and switchroom equipment for West Caroline-street power house, and Bispham and Cleveleys sub-stations, suitable for controlling 6 600 V, three-phase, 50 periodicity supply (section 4); h.t. armoured transmission three-core cables suitable for above supply; 12 miles 0·2 sq. in. three-core feeder, 5 miles 0·175 sq. in. three-core feeder, and 8½ miles six-core pilot cable (section 5). Particulars from the Borough Electrical Engineer and Tramways Manager, Mr. C. Furness.

Bristol Docks Committee. March 17.—Four 30 cwt. movable electric jib cranes. Specification, &c., from the Engineer, Avonmouth Docks.

Edinburgh Corporation. March 20.—Auxiliary plant and pipework for Portobello power station. Specifications from Sir A. B. W. Kennedy, 17, Victoria-street, Westminster, S.W. 1.

AUSTRALIA.

Municipal Council of Sydney (Electricity Department). April 24.—*Supply, delivery, and erection of two 2 000 kW rotary converters; one 10 000 to 12 000 kW turbo-alternator.

State Electricity Commission of Victoria. April 29.—22 000 V three-core cable and accessories for Morwell Power Scheme (Spec. No. 200). Copies of tender from and specification available on application to the Agent-General for Victoria, Melbourne-place, Strand, London, W.C. 2.

Siemens Bros. have secured a contract for 6 000 telephone lines at Winnipeg.

Liverpool Board of Guardians have accepted the tender of the Electrical Contracting and Motor Company for an electrical installation at £21 000.

Leyton Urban Council have placed an order with the Brush Electrical Engineering Company for a motor-generator for the electric vehicle garage at £410.

Llandudno Urban Council have accepted the tender of Bruce, Peebles & Company for 500 kW and 330 kW converters, at £2 450 and £1 725 respectively.

Aylesbury Town Council has accepted the following tenders:—Hackbridge Cable Company, for cable, at £295; British Electrical Transformer Company, for transformers, at £168; General Electric Company, for transformer plant, at £2 739.

In addition to the large order for electrical equipment for the Brighton Railway recently obtained by the General Electric Company, big contracts have been secured by the company for the supply of generating plant in China and India, one being for the Bombay and Baroda Railway, and three lesser orders, of the total value of £40 000, for the Colonies, including a £15 000 contract for Pretoria.

* *Particulars from the Department of Overseas Trade.*

Arrangements for the Week.

FRIDAY, Feb. 24th (to-day).

Royal Society of Arts.

4.30 p.m. At John-street, London, W.C. Paper on "Brown Coals and Lignites," by Prof. W. A. Bone, F.R.S.

Physical Society.

5 p.m. At the Imperial College of Science, London, S.W. Papers to be read: "The Number of Radio-active Transformations as Determined by Analysis of the Observations," by Dr. H. Levy; "A Graphical Method of Treating Fresnel's Formulæ for Reflection in Transparent Media," by Prof. C. H. Lees, F.R.S.; Demonstrations of a Sensitive Method of Determination of Density, &c., by the General Electric Company's Research Department; and Demonstration of the Physical Properties of Cellactite, by Mr. F. C. Dyche-Teague, B.Sc.

Electrical Power Engineers' Association.

7 p.m. At the Engineers' Club, Coventry-street, London, W. Informal discussion on "Boiler Troubles."

Technical Inspection Association.

7.30 p.m. At the Royal Society of Arts, John-street, London, W.C. Lecture on "The Extrusion of Metals," by Mr. R. Genders, M.B.E.

North-East Coast Institution of Engineers and Shipbuilders.

7.30 p.m. At the Literary and Philosophical Society, Newcastle-on-Tyne. Paper on "Running Costs of Diesel-Engined Ships," by Mr. T. Madsen.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, London, S.W. Lecture on "Curved Beams, Rings and Chain Links," by Prof. E. G. Coker.

Edinburgh Electrical Society.

8 p.m. At the Philosophical Institute, 4, Queen-street, Edinburgh. Paper on "Some Experiments in Electrical Sound Detecting," by Mr. B. A. Pilkington.

MONDAY, Feb. 27th.

Institution of Electrical Engineers.
(North-Eastern Centre.)

7.15 p.m. At Armstrong College, Newcastle-on-Tyne. Discussion on "Starters," introduced by Mr. J. Anderson, and "Some Notes on the Design of Liquid Rheostats," by Mr. W. Wilson.

Royal Society of Arts.

8 p.m. At John-street, London, W.C. Cantor Lecture on "The Mechanical Design of Scientific Instruments," by Prof. A. F. C. Pollard. (Lecture II.)

TUESDAY, Feb. 28th.

Institution of Electrical Engineers.
(North Midland Centre.)

7 p.m. At the Film Trade Exchange Theatre, Leeds. Exhibition of Cinematograph Films, by Dr. C. C. Garrard and Mr. F. Gill, O.B.E.

Junior Institution of Engineers.
(North-Eastern Section.)

7 p.m. At Armstrong College, Newcastle-on-Tyne. Paper on "Drop Stamping and General Forge Work," by Messrs. E. F. Lough and R. N. Richardson.

Institution of Electrical Engineers.
(North-Western Students' Centre.)

7.30 p.m. At Houldsworth Hall, Deansgate, Manchester. Paper on "The Application of X-Rays to the Engineering Industry," by Mr. A. F. Steel.

Illuminating Engineering Society.

8 p.m. At the Royal Society of Arts, John-street, London, W.C. Discussion on "Industrial Lighting: Ideal Requirements (Legislative and Otherwise) and Practical Solutions," opened by Mr. L. Gaster.

WEDNESDAY, March 1st.

Newcomen Society.

5 p.m. At Caxton Hall, London, S.W. Paper on "Timothy Hackworth and the Locomotive," by Mr. R. Young.

Institution of Electrical Engineers.
(Wireless Section.)

6 p.m. At Savoy-place, London, W.C. Paper on "The Thermionic Triode as a Rectifier," by Messrs. E. B. Moullin and L. B. Turner.

Industrial League and Council.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "The Purpose of Economic Activities," by Mr. H. Cousens.

THURSDAY, March 2nd.

Institution of Electrical Engineers.

6 p.m. At Savoy-place, London, W.C. Discussion on "Starters," with Introductory Papers on "The B.E.S.A. Specifications for Starters," by Mr. C. H. Wordingham; "Electric Motor Starters," by Mr. J. Anderson; and "Some Notes on the Design of Liquid Rheostats," by Mr. W. Wilson.

Liverpool Engineering Society.
(Students' Section.)

7.30 p.m. At the Royal Institution, Colquitt-street, Liverpool. Paper on "Wireless Telegraphy," by Mr. T. E. Daniel.

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Bankruptcy Information.

POLLARD, Claud, 12, Corporation-street, Halifax, electrical engineer. Feb. 14. Debtor's petition. First meeting, Feb. 24, 10.15 a.m., and public examination, March 24, 10.30 a.m., County Court House, Prescott-street, Halifax.

TRUELOVE, Harold (trading as H. TRUELOVE & COMPANY), 19, Shepley-street, Stalybridge, co. Chester, electrical engineer. First meeting, March 3, 3 p.m., Official Receiver's Offices, Byrom-street, Manchester. Public examination, March 6, 11.15 a.m., Town Hall, Ashton-under-Lyne.

Company Winding-up Voluntarily.

RUSHMORES (1919) LTD. T. D. Addis, of 26A, Peterborough-road, Parsons Green, London, appointed liquidator. Meeting of creditors at the liquidator's office on Feb. 23 at 4 p.m.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

BARNETT, Barnard, 100, Bethune-road, Stoke Newington, electrician. £18 17s. 11d. Dec. 8.

CASS, M., & COMPANY, 25, Upper Parliament-street, Liverpool, electricians. £13 0s. 3d. Dec. 8.

CUFFE, Mr. F., 200A, Regent-street, Hull, electrician. £27 19s. 4d. Dec. 8.

GREENLING ELECTRIC SUPPLIES, LTD., manufacturers. £10 8s. Dec. 13.

HAINES, J. M., 252, Hackney-road, E., electrical engineer. £29 18s. 1d. Dec. 7.

HOPKINS, Hopkin, Bryneithin-terrace, Morriston, Swansea, electrical engineer. £11 0s. 6d. Dec. 5.

HURLINGHAM ELECTRIC COMPANY, 283, New King's-road, Fulham, S.W., electrical engineers. £23 6s. 11d. Dec. 2.

LOWER, A. & E., 670, Seven Sisters-road, N., electricians. £20 9s. 9d. Dec. 6.

REGAN BENNETT & COMPANY, LTD., R/O, 32, Charing-cross, S.W., electrical engineers. £25 16s. 11d. Dec. 16.

SHAW & COMPANY, 172, Oxford-street, Manchester, electrical contractors. £21 19s. Dec. 6.

SOHO ELECTRICAL WORKS, 125, Islington, Liverpool, electricians. £14 12s. 2d. Dec. 19.

WOUTERS, HERBERT, & COMPANY, 14A, Beaumont-road, West Kensington, electrical engineers. £30 3s. Dec. 1.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

MITCHELL'S ELECTRICAL & WIRELESS, LTD., London, S.E. Registered Feb. 4. £550 debentures; general charge. *Nil. Sept. 13, 1921.

MORGAN EBONITE COMPANY, LTD., Failsworth. Registered Feb. 10, mortgage, to Manchester & Liverpool District Banking Company, Ltd. *Nil. Oct. 27, 1920.

VICTORIA ELECTRICAL (MANCHESTER), LTD. Registered Feb. 7, £7 000 debentures, present issue £6 250; general charge.

Satisfaction.

WINN (Charles) & COMPANY, LTD., Birmingham, manufactures gas and electric fittings. Satisfaction registered Feb. 14, £9 000, part of amount registered Sept. 26, 1918.

Receivership.

APPLEBY CRANE & TRANSPORT COMPANY, LTD. Sir William B. Peat, of 11, Ironmonger-lane, E.C., ceased to act as receiver or manager on Feb. 10, 1922.

Deed of Arrangement.

BARDSLEY, James Nelson, 179, Katherine-street, and 254, Newmarket-road, Ashton-under-Lyne, electrician. Trustee, A. T. Eaves, 15, Fountain-street, Manchester, C.A. (Filed by order on terms.) Liabilities unsecured, £1 287; assets, less secured claims, £385.

Private Meeting.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

RAWCLIFFE, FRANK, & COMPANY, LTD., electrical factors, 8, Nun-street, Newcastle-on-Tyne. A meeting of creditors was held in London last week, when a large number of creditors attended, and the chair was taken by Mr. W. Brittain, the voluntary liquidator of the company. A statement of affairs showing the position as at Jan. 30 last disclosed liabilities to unsecured creditors £14 325 and estimated assets (after allowing for preferential claims) £11 329. There was therefore an estimated deficiency of £2 996, while as regards shareholders the total deficiency was £11 466. The company had been formed in April, 1921, and took over the business successfully carried on for some years by Mr. Rawcliffe, who was now a cash creditor for £3 500. The liquidator said he was instructed on behalf of the directors to submit an offer to the meeting of 10s. in the £, and it was proposed that there should be a scheme for the transfer of the whole of the assets to a new company, and that a debenture should be issued in respect of those assets for an amount necessary to pay the composition referred to by instalments of 2s. 6d. each at three, six, nine and twelve months. The debentures would no doubt bear interest at 5 per cent. or some similar rate. After some discussion it was resolved, on the motion of Mr. Houstoun, representing the Stella Conduits, Ltd., seconded by Mr. C. G. Poppleton, representing other creditors, that the liquidation should be continued with a committee of inspection, consisting of Mr. Maurice (Catchpole & Maurice); Mr. E. A. Ingold, and the representatives of the Stella Conduits, Ltd.; Mr. Joseph, of Messrs. Joseph & Company; and Callenders Cable & Construction Company, Ltd. The following are creditors:—Favell & Company, Newcastle-on-Tyne, £154; B.T.C. Electric Lamp & Accessories, London, £591; Cable Accessories Company, London, £135; Callenders Construction Company, London, £820; Catchpole & Maurice, Ltd., London, £234; British Driver Harris Company, London, £486; Efanden Company, Wolverhampton, £120; Enfield Ediswan Cable Company, London, £148; Joseph & Company, London, £188; Canning, W., & Company, Ltd., Birmingham, £372; Cryselco, Ltd., Bedford, £251; Electric Accessories Company, Leeds, £81; Ingold, Ltd., Shipley, £628; Kent & Company, Burslem, £210; Stella Conduits Company Bilston, £247.

Catalogues, Price Lists, &c.

Leaflet No. 2 676, published by the GENERAL ELECTRIC COMPANY, contains revised catalogue prices of the automatic circuit breakers appearing in Section X 3 of the firm's complete catalogue.

A recent catalogue of THOMAS BROADBENT AND SONS contains a large amount of interesting information regarding the electric capstans made by them. A special point is that the control gear is of the automatic contactor type, which, it is claimed, is absolutely foolproof, besides being of sound and substantial construction. It consists of a time or current limit self-starting rheostat, which embodies no-volt release features.

THE ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, whose London offices are at 56, Victoria-street, S.W. 1, have just issued a general booklet descriptive of their works and manufactures. This booklet is exceptionally well illustrated, and contains, among other photographs, two aerial views of the works at Marcinelle Villette, near Charleroi, and at Ruysbroeck, near Brussels. Two photographs show respectively the main shop and the cable department in the condition in which they were found at the date of the Armistice and one year after, when the machinery which had been removed by the Germans had been reinstalled. The publication is divided into twelve sections, and covers practically the whole range of electrical manufacture. It is interesting to note that, although the works were situated in that part of Belgium which was occupied by the Germans during the war, since the Armistice it has been possible to re-establish the factory to such an extent that at present about 5 000 people are employed.

The Editorial, Advertisement and Publishing Offices of "THE ELECTRICIAN" are at 8, Bouverie Street, London, E.C. 4. Telegrams: Benbrotric, Fleet, London. Telephone: City 9852 (5 lines).

The subscription to "THE ELECTRICIAN" is £2 12 0 per annum in the United Kingdom, and £2 14 0 per annum Abroad. Advertisement Rates can be obtained on application to the Manager. Advertisement copy and blocks should be received on the Friday preceding date of publication.

CONTENTS.

Notes of the Week.

The Latest (and Last?) Electricity Act.

At a certain place in Mr. Arthur Neal's speech at the annual luncheon of the British Electrical Development Association last week, an almost audible sigh of relief arose from his audience. It was not that the speech was too long and uninteresting, or that the speaker was about to sit down, but that he had announced that the Government would do everything to remove obstacles from the path of the electricity supply industry, and so make clear the way to progress. If we did not know it already, the baleful effect of legislation on the electrical industry was obvious from the remarks of many of the speakers at the Institution Commemoration; and we may, therefore, be forgiven for believing that once that burden is removed the machine will revolve more easily. Unfortunately, that state of things cannot at once be attained. The electricity supply industry is uneasily poised on the top of a barbed wire entanglement, and just one more little act (which we hope will really be the last) is required to bring it down on the right side of the fence.

A Non-Contentious Measure.

We are, therefore, glad to see that a non-contentious measure has so quickly been introduced into the House of Lords, whence we hope it will receive an easy passage through all stages. The measure, which appears to contain all the clauses, especially those relating to charging, which we have recently advocated, will confer on the Commissioners further powers, powers which far from meaning greater autocracy, should really lead to a lubrication and easier running of what is, through nobody's fault, a rather creaking and rusty piece of mechanism. This is a matter of both urgency and importance. Uneasiness and uncertainty about the future are preventing extensions being made by supply undertakings, are resulting in money which would otherwise be used to feed the electrical industry going elsewhere, and are bidding fair to bring about a condition when the public will be demanding electricity and there will be none to give them. The sooner, then, that this measure is passed, and we can all once more settle comfortably to business, the better for everyone.

The North-West Midlands Inquiry.

The scheme for the reorganisation of electricity supply in the North-West Midlands Electricity District which has been under investigation during the present week by the Electricity Commissioners, appears to have been put forward solely in the interests of the municipal undertakers, and they would like the proposed Joint Electricity Authority to be representative of them. There are, however, two power companies in the district, viz., the Midland Electric Corporation for Power Distribution and the Shropshire, Worcestershire and Staffordshire Electric Power Company, and it is proposed to purchase the rights of these so as to make the authority an exclusively municipal one. In addition, railways and tramways, and other large consumers of power would have no representation, as it is thought by the promoters that "only the people who find the money should be represented." Apart from the fact that it seems to be in conflict with the spirit and objects of the Electricity (Supply) Act, we believe this to be a mistaken attitude, for a few representatives of the railways and other power consumers would be of great service in keeping the authority in touch with impending developments, while questions relating to charges for electricity and other matters could also be settled readily by direct negotiation.

Discordant Municipal Councils.

In regard to the scheme itself, there appears to be some conflict of opinion between the municipal authorities. There are fourteen generating stations owned by ten authorised undertakers, and it is suggested that these should be

acquired by the Joint Authority, and three new power stations erected at Rugeley, Stoke and Ironbridge respectively. Walsall objects to the transfer of its station at Birchills, which it considers to be well placed for conversion into a bulk supply station. Newcastle-under-Lyme is also opposed to the transfer of its station, and in the absence of compulsory powers of purchase the Joint Authority will, therefore, find some difficulty in carrying out their programme. We are pleased to notice that the Commissioners intend to do everything possible to extend the use of electricity, for, in the course of a discussion on a clause imposing an obligation to provide a supply of current for collieries and industrial works, Sir JOHN SNELL intimated that it was competent for the Commissioners to impose such an obligation in the event of an authorised undertaking raising unreasonable objections to the giving of a supply.

Power and Traction Prospects.

INDUSTRIAL developments in the area between Stoke and Lichfield are expected to result in heavy power requirements, and an early electrification of some of the local railway lines is also anticipated. The evidence tendered on behalf of the railway companies showed that there is a heavy and a growing passenger and goods traffic, and electrification would be a remunerative policy to adopt. No doubt when the railway amalgamation scheme is complete the subject will be considered, but apart from the traction supply there is likely to be an increased demand for power from the railways in the near future, while there is also an excellent colliery load in prospect. It is, therefore, to be hoped that a suitable scheme will be formulated by the Commissioners, in order that there may be no delay in making the necessary preparations for meeting the demands, immediate and prospective, for electricity in the district.

Telegraphy in the Background.

THOUGH generally filled with admiration at the arrangements made for the commemoration of the Jubilee of the Institution of Electrical Engineers, we may be, perhaps, allowed one small criticism—the preponderating amount of time given to matters connected with electricity supply, and, consequently, the very small amount of time given to telegraphy. This is the more astonishing when we recall that in 1872, the date the Institution was celebrating, electricity supply did not exist—telegraphy was the electrical industry—and, though in the intervening years the supply side has far outgrown the weak-current section, the greater claims of the latter to longevity might well have been more stressed. Telegraphy was, in fact, represented by two speakers only, Sir W. NOBLE and Mr. JUDD, and, though at the present time it goes so evenly on its way, both technically and commercially, as almost to be forgotten in the clash of battle on the supply side, there are incidents in its early days which would not only make good reading, but from which useful lessons can be learnt.

Some Forgotten Pioneers.

THOUGH we have no wish to swim the troubled waters, where this or that invention or this or that piece of work is definitely ascribed to one person, it is rather strange that the whole of the credit for early submarine telegraph progress should have been given by Mr. JUDD to Sir JOHN PENDER. Sir JOHN PENDER, as we have reason to know, was an enterprising and far-sighted business man, who did much for the development of submarine telegraphy, but he was in no sense an engineer; and it would, therefore, have been better in a gathering of engineers to have laid greater stress on the work of KELVIN, BRIGHT and FLEEMING JENKIN, to mention only three names. KELVIN himself and Sir HENRY MANCE, in their respective presidential addresses to the Institution of Electrical Engineers, gave, it may be noted, the credit for the engineering side of the early submarine telegraph work solely to BRIGHT.

The Engineers' Dispute.

IT is regrettable that a grave crisis, which may develop into a national stoppage of work, should have arisen in the engineering industry, and we sincerely hope that every possible avenue to peace will be explored between now and March 11, the date fixed for the beginning of the lock-out. The present dispute, which has arisen out of the interpretation of three clauses of the agreement made in September, 1920, only relates to overtime and the working of night shifts. It would be a disaster, not only for those immediately concerned, but for the country, if the matter were allowed to take its normal course.

Wiser Counsels.

FORTUNATELY, there are indications that wiser counsels will prevail, and that mutual explanations may lead to an understanding. Neither the employers nor the men desire overtime, but there are occasions when it may be necessary to work it, and as the men appear to have conceded this point, the real question is what is "necessary" overtime. The employers maintain that they alone shall decide, but the men claim that they, or their representative, should also be "consulted." Clearly it is right and proper that the employer, who alone bears the risk of loss or profit on a contract, should have the right to decide this important point, though it would be good policy to give an explanation to the men when it is necessary to work extra hours. At present nearly one-fourth of the members of the men's union are out of work, and as it has adopted a conciliatory attitude so far, it is to be hoped that it will be able to make its members take a sane view of the matter, and not push matters to extremes.

The Hull Electricity Undertaking.

THE report of the Special Sub-committee appointed to investigate conditions in Hull Corporation electricity department discloses such an unfortunate state of affairs that we are not surprised at the heavy deficit of £16 000 on the year's working. Some of the trouble appears to be due to a lack of that co-operation which ought to exist between the engineer and the chairman of the Electricity Committee and between the engineer and his chief assistant; and the remainder may be ascribed to the war, and to a want of due appreciation of its consequences. It was almost impossible to carry out adequate repairs between 1914 and 1918, and now they have proved much more costly than was anticipated. The reserve fund was inadequate, and instead of devoting it to repairs, it was employed for purchasing new plant for which borrowing powers could not at the time be obtained. The result is that the undertaking, which has a capital expenditure of about £800 000, is now without a reserve. For many years we have been urging the provision of an adequate reserve by all municipal electricity supply undertakings, and we should like to see the maintenance of a minimum reserve of 5 per cent. of the outstanding capital made compulsory.

Cause of the Trouble.

BUT matters do not end there, for the efficiency of the generating plant is poor, the coal consumption being given as 6·7 lbs. per unit generated. This

is attributed to the absence of economisers on the new water-tube boilers, to inefficient mechanical stokers, and to inadequate chimney shafts. Certain recommendations were made by the engineer in order to improve matters, but as there was a conflict of opinion between him and his chief assistant it has been decided to call in a consulting engineer to advise the Committee. Serious errors were also made in estimating the cost of some new plant and of extending the supply cables to Melton. In addition, it is alleged that the charges for electricity were not increased sufficiently to cover the increasing cost of supply, and, to complete the list, during the period from 1914 to 1919 the number of employees of the undertaking increased from 140 to 220, though it is pointed out that the reduced hours of working would only have necessitated an increase of from twenty-five to thirty men. Under the circumstances we think the Committee are wise in calling in an independent investigator to put the undertaking on a sound financial position, and to restore order out of the present chaos. The Hull undertaking has been fairly successful in the past, and we hope that as soon as the present domestic dispute is settled things will rapidly become normal once more. For continued success an engineer must have the support of the Committee, and he must also have the loyal co-operation of the whole of his staff. In brief, organisation and discipline must be maintained, though in the present case the root of the trouble can be traced to the absence of the engineer at the war.

An Unsuccessful Proposal.

It will be remembered that a Special Conference, representing the various branches of the electrical industries was recently convened to deal with the question of unemployment. They accomplished their task successfully and very amiably, and subsequently it was proposed that the conference, instead of being a temporary body, should be converted into a permanent association under the imposing title of the Conference of Joint Industrial Councils and Other Bodies in the Electrical Industry. This association was to comprise the three Joint Industrial Councils, *viz.*, those dealing with cable-making, contracting, and electrical supply, together with representatives of the British Electrical Development Association, the Electrical Wholesalers' Federation, and the B.E.A.M.A. As the purpose of the Conference was publicly to represent the interests of the whole of the electrical industries, the proposal was naturally taken seriously by the bodies concerned. Now we hear that the electricity supply branch, through the National Council, have refused to be parties to this permanent organisation, explaining that, although they are willing to co-operate on special matters, they do not agree to the formation of a permanent and independent body. This is not surprising, for, though the constitution of the Conference is, of course, adequate for dealing with a special matter like unemployment, it is obviously weak as a fully representative body, since neither of the four associations of the electricity supply industry is directly represented. Seeing that the proposed permanent conference is largely political in aim, it is hardly to be wondered at that the electricity supply industry refuses to delegate such important powers to any one of their own associations.

Two Important Exhibitions.

The immediate effect of exhibitions on trade is rather hard to gauge. For large crowds and the optimism of salesmen, based upon interested inquiries, do not always lead to the orders which alone make the enterprise and money expended worth while. The indirect effect is, however, good. For it cannot be denied that the firm that never exhibits, though it may not lose any definite orders, is failing to take advantage of that psychological aid to increased business which is known as keeping one's name before the public. We are, therefore, glad to learn that the electrical industry is well represented both at the Birmingham Section of the British Industries Fair and at the Ideal Home Exhibition at Olympia. The former of these, which was first held in 1915 for the purpose of enabling British manufacturers to show goods which had not previously been made in the United Kingdom, has since grown to include practically every British industry. It has a direct appeal to trade buyers, and is, in fact, only open to them.

Striving for the Ideal Home.

On the other hand, the Ideal Home Exhibition throws the widest net. Its aim is to show how a house fit not only for heroes, but for ordinary people, can be built, equipped, and run. To approach to within even a long distance of idealism the employment of electricity is necessary, and we are not surprised to find that the uses to which electricity can be put in bringing about the utmost quantity of labour saving and comfort in the home are being adequately displayed. Indirectly, electricity will also play a great part. For lighting schemes and decorative effects, which help so much to display goods and attract attention, would be impossible without its aid. Nevertheless, we ask electrical engineers to approach the exhibition in a spirit of criticism. The display will be adequate, but we fear it will be little more. It is their duty to see that another year it is very much more. Last year an often-heard complaint was: "It is very nice, but it is so expensive." We fear the complaint will be repeated with equal justice this year. That is one of the things which the electrical industry should set about altering by all the means in their power.

Geddes—Vol. III.

To readers of The Electrician the most interesting part of the third and final Geddes report will be that which deals with the Post Office. The conclusions of the committee are that a regular and systematic check should be instituted on the postal services, that the cost of the staffs can be reduced by nearly £400 000 per annum, and that the provisional estimate can be reduced by nearly £2 500 000. Now, Post-Office finance must be approached in a different way from that suitable for other Government Departments. For the Post Office not only spends, but should earn money. As we have so often stated in the case of the municipal electricity supply departments, its aim should be, not to make a profit, but to give the best service possible at the lowest possible cost without a deficit on the year's working. This does not mean stinginess, for a well-paid staff and wise expenditure on material are sound finance, but it does mean a careful check on all outgoings, and guarding against inflated staffs. The appreciable reduction in postal traffic since 1913-14 shows that one of these essentials is not being fulfilled, while the increase of staff in the same time indicates a failure to deal with another. These are certainly matters which should receive close attention, and we are glad to see that Mr. Kellaway hopes to go £10 000 000 better than Sir Eric Geddes. It is, however, to be hoped that he will also be able to remove some of the restrictions upon postal facilities which are such a burden upon business. One thing is as important as the other, for without easy and cheap communications trade cannot flourish.

The Jubilee Commemoration

The Jubilee commemoration of the Institution of Electrical Engineers has primarily resulted in the production of a mass of material which it is impossible to deal with at length in the columns of The Electrician. Had it been necessary for us to do so we should have failed in our duty; but, fortunately, a special edition of the Institution "Journal" is to be published, which will contain not only the speeches made at the various meetings, but also communications from a large number of understudies which the Council, perhaps warned by past experiences, provided. This will enable those interested in electrical history, as everyone should be, to examine the various reminiscences in a way which was not possible at the meetings themselves. We shall look forward to studying this official account. For it will be not only a valuable and interesting document, but a record of opportunities seized and lost, of shifts, of ingenuity, and, not least, of humour. It is a poor heart, unworthy of the adventurer, that cannot see what Meredith called the comic spirit playing over the most anxious of these early experiences, and our early *raconteurs* were obviously not lacking in the possession of this valuable quality. Often enough they needed it.

Personality the Keynote.

It may be said with a good deal of truth that personality was the keynote of the Commemoration. The various speeches were not only accounts of adventures, but were, generally unconsciously, reflections of human nature as exhibited in the engineer. "The nature," says Shakespeare, "is subdu'd to what it works in." And this is equally true of the engineer's nature as of the dyer's. This point is excellently made by Mr. Alan Sullivan in his attempts in the article which we publish elsewhere to discover the ingredients which go to make up the composition of the successful engineer. What he has to say will be studied with blushing interest; we only hope it is not too complimentary. He also recommends that the engineer should endeavour to break down the insulation which exists between him and his fellow-men, by communion with "a large-minded bishop, a manufacturer, a stockbroker, and a dealer in sporting goods." This advice might well be taken for the good of all the parties concerned.

It was inevitable, in proceedings like these, where the personal element was so much to the fore, that the names of famous past and living workers should have come up over and over again in the debates. It was not only inevitable, but just. For progress and the acquisition of knowledge are in the limit the result of human endeavour, and it is therefore fitting that the names of those who made that progress and acquisition possible should be suitably honoured. A Commemoration could have no better aim than this.

Faraday and Heaviside.

Now, if those who attended the meetings will review the proceedings from the human point of view they will discover this result: That the two names most frequently mentioned, and in the highest terms of honour, were first Faraday (which is not surprising) and secondly Heaviside (which is). For there can be no doubt, as Dr. Fleming pointed out, that all glory must be given to the man who not only made the discoveries which have rendered modern electrical engineering possible, but who examined and collated the work of others and put it forward afresh in a form in which it could be used. Both as a scientist and a man, Faraday was an example which none of us to-day would lose by following. The Roman Church lays down a period of years after death before one of its members can be canonised. This is a wise provision. It allows the brightness of the good qualities to be toned down, and mercifully glosses over the black patches. If, at the end of the time, the man seems worthy of that apotheosis, it is felt that the honour is fitly due. So with Faraday; and the Institution were therefore only giving him his due in raising him to the highest place in their Commemoration.

Lightening Obscurity.

Now, in Heaviside's history there are points both of similarity and dissimilarity with that of Faraday. His early work did not receive that attention which it merited, but, unlike Faraday, some share of general recognition is still lacking. Perhaps it is too soon, and, in any event, it is not unnatural that this should be so. The problems with which Heaviside dealt, and the way in which he treated them, are both remote from the intellectual processes of the average electrical engineer. It is recognised in a vague sort of way that he did some very good work, but what and where are equally unknown. A good deal of this obscurity is now cleared up by Dr. Eccles' remarks in proposing the resolution which, on the suggestion of Sir Oliver Lodge, the Council submitted to one of the Commemoration meetings, and now no one who belongs to the Institution need have excuse for doubting Heaviside's place among the electrical immortals. It is now some years since he had conferred upon him the highest honour which it is in the Institution's power to bestow. But that was no more than his due, and the additional honour is but a graceful act.

The Turbine and Electricity Supply.

We were glad to see another of the Institution's short list of honorary members present at the Commemoration. Sir Charles Parsons gave a most interesting and modest account of the development of the steam turbine that bears his name. That development is once again a history of failure, disappointment, and ultimate success. How great its effect on the progress of electricity supply has been is vaguely known to all electrical engineers. To gauge that effect in a more material form it is only necessary to visit a station like Bankside, and compare the space once occupied by the reciprocating sets with that taken up by turbines of a much greater output. When to this saving in space is added a reduced steam consumption and higher thermal efficiency, the advance that has been made possible by Parsons' researches is amply demonstrated.

Inventive Curiosity.

In connection with the Jubilee celebration, only one other name need be mentioned—Ferranti. Dr. Ferranti gave a most interesting account of his early devotion to electricity, and of how that inventive curiosity which he then displayed was turned to practical use later on. With him, we learnt, lay the premature conception of the idea of the large electricity district, an idea unfortunately killed by myopic legislation. It was his, and his devoted assistants', work to face the task of inventing a new industry, of finding material to do things which had never been done before, and they successfully won through.

The Re-birth of the Institution.

We seldom hear Dr. FERRANTI speak without his propounding some idea which is worth consideration. His remarks at the Jubilee Commemoration were no exception. In 1910, he said, when he became President of the Institution, he found it slow, quiet, and ready to die out or proceed in a way that made its future uncertain. He saw what a great good the Institution might be, and how much it could do for electrical science and for those who gave their lives to it. He felt it wanted life, and he tried to infuse life into it. This, we think, is the lesson of the Commemoration. Dr. FERRANTI's energy galvanised the Institution into life when it was becoming moribund, until at the end of fifty years of existence it is running more strongly than ever before. Moreover, it has no lack of talent within its ranks; in fact, Mr. SWINBURNE would have us believe the talent available is greater than it ever was. It is for us all to see that that talent is utilised in a way which will redound to the greatest good of the profession, and assist to the greatest possible extent in the development of the industry.

Rotary Converter Practice.

THE rotary converter is at once the Cinderella and the spoilt child of the electrical industry. For while, like its fairy prototype, it performs a series of useful functions, there are not wanting those who would like to see its employment dispensed with altogether, and who contend that it is more trouble than it is worth. It is true that these attacks are not made directly on the rotary converter. The real point at issue is whether direct-current distribution should not be discarded in favour of the alternating-current system, or, for those who are not prepared to go as far as this, whether the mercury-vapour rectifier could not do as much or more at a lower first cost and with less maintenance than either the rotary converter or the motor generator. If either or both these schools have their way, and they are rapidly gaining recruits, Cinderella will disappear into depths from which rescue by any fairy prince, however enterprising, will be impossible.

History Repeating Itself.

That this should happen would in many ways be a pity. But in the electrical industry we are not unused to seeing much work and money put into inventions and improvements which subsequent developments have rendered entirely nugatory. The direct-current turbo-generator is a case in point. For many years much skill and labour were expended in the design and manufacture of these machines. Experience brought forth improvements and better workmanship, until finally a perfected machine was obtained. Then the direct-current turbo-generator disappeared from mortal view, not because it would not work, but because it was not wanted.

As a spoilt child, the history of the rotary converter is not dissimilar. The early machines, especially those designed for the higher frequencies were far from satisfactory. The use of auxiliary poles, of damping windings, and of other devices, gradually did something to bring about an improvement, which, together with the inherent advantages of the rotary machines, over which we do not wish to gloss, has made it a class of electrical equipment from which but few improvements may be expected. Th s much, however, could be said about the direct-current turbo-generator, and we have seen the sequel. Will history repeat iteslf, and the rotary disappear because its place can be filled in some other way?

Rotaries and the Frequency Problem.

Though Mr. F. P. WHITAKER, who recently read a Paper on " Rotary Converters, with Special Reference to Railway Electrification " before the Institution of Electrical Engineers, neither asks this question nor supplies an answer, yet his contribution is of special interest in view of his saving clause. As is well known, the standard frequency of the future is to be fifty. A rotary converter does not work without difficulties on a traction load with this and higher frequencies. For reasons connected with the commutator a fresh set of difficulties arises when 1 500 V, which is to become the standard traction voltage, is employed, and these difficulties will be increased if the voltage is raised to 3 000 V.

Qualities for Admiration.

Even on 1 500 V the difficulties are sufficiently great to make it hard for us to decide which to admire most, Mr. WHITAKER's continued advocacy of this type of machine in general or the enterprise and care which have been expended in bringing the equipment to its present state of usefulness. Both these qualities are well illustrated by the history, given in the Paper, of the design and operation of three 800 kW 1 500 V d.c. rotary converters supplied to the North-Eastern Railway for operating the Shildon-Newport line. These machines work on 40 periods, and consist of two 400 kW 750 V rotaries connected in series. To allow for the severe short circuit conditions which might reasonably be expected, the machines were built with a completely insulating and fireproof screen between the commutator and the rest of the machine, good clearance was provided between the positive and the negative brush arms, and the operating details of the brush gear were well protected.

Commutation Conditions.

Commutation was satisfactory up to three times the full load, while to reduce the severity of the flash overs, which the illustrations in the Paper show to have been pretty severe, instantaneous trips were fitted on the a.c side. Later a step further was made with a 1 200 kW unit consisting of two 600 kW machines in series in which the diameter of the commutator was practically the same as that of the armature, the brush gear is carefully protected, and in the case of flash over the damage is almost negligible. Other features such as clearances, insulation, and commutator protection, have received special attention. These machines have been in operation for four years, their performance has been excellent, and their cost of maintenance low, while further improvements in the direction of making the machine itself more robust and self-protecting have been carried out.

A Live Subject or a Swan Song?

All these details go to show that rotary converter design and manufacture is on as high a plane as any other product of the electrical industry. Mr. WHITAKER is, therefore, to be congratulated on bringing a very live subject before the Institution, and especially on the clearness with which he has stated his case. For his sake we hope it is no swan song. But we confess we have our doubts. We now speak primarily of the traction field. Are we really going to use high-tension direct current traction on any large scale? If we are, Mr. WHITAKER will be amply justified; but we rather wonder.

It is My Privilege to Introduce . . .

By ALAN SULLIVAN.

I have been listening to pioneers, and searching a technical audience meanwhile, to try and discover whether there are any noticeable attributes that differentiate the man of science from the every-day ruck of humanity. But no externals are visible. He is, I think, rather more quiet. He is apt to be more casual about his dress. He has moments of abstraction more frequently than his fellows. I take it that he puts his back into his play—if he indulges in play to any extent—as much as into his work. I can see him at golf—but not at ping-pong.

His memory is good, sometimes painfully so. Outside of his own peculiar province he does not seem much interested. His political knowledge will probably turn on legislation affecting the industry, and he will recall the names of the men who did the foul deed.

Modesty, Self-Induction and Insulation.

He is, however, modest. This is, no doubt, because he realises how little he actually knows, and how much remains to be done. Temperamentally he varies a good deal, being at some times capable of self-induction, and, at others, unaffected by neighbouring potentials. As to his methods of working, he may be either series or shunt wound. But, whichever it is, he can usually be trusted to carry the load. Some engineers are too highly insulated. You know what is meant by this. Most of them ache at times to discard their covering and expose the bare conductor, but they experience what amounts to nothing less than a dread of personal nakedness, and jog along inside the unprofitable coating. It is, as a matter of fact, quite possible for an engineer to be more sensitive than a debutante—much more than some debutantes.

The Human Hawk—

Getting back to the pioneers. I have been listening—and thinking. One of them, a slight man, lean, with a projecting chin, and still energised in advanced years by the fluid in which he dealt, reminded me of a scientific hawk. With aquiline nose, a sharp, incisive gesture, eyes that still flashed with the romance of his own past, he seemed a sort of human dynamo. More than this, it was evident that he valued his failures as much as he did his unnumbered successes. One got the idea that he found in them a greater incentive. It was easy to visualise him in his prime, dashing here and there, almost emitting sparks, and darting from the short circuit of the impetuous attempt to the smooth pressure of achievement. This man found humour in it all—even in his battles, and he had many. He might be checked, but never defeated. He has too many facets of intelligence ready to be turned in any direction ever to allow him to be quite confounded.

—and the Olympian.

Another pioneer gave the impression of an Olympian, who moved in contemplation amongst the eternal verities. Here was a different composition. He built up systems and indisputable analogies, but not dynamos. His field was the empyrean one of thought. One could picture him collaring some nebulous and half-developed theory, dragging it off to the country, pushing it into a chair across the hearth, and reasoning it into almost conscious existence. He had, too, a placid quality. It struck me that he might talk on one subject while he thought about another, and both with entire success. One cannot divest oneself of what information may be possessed, but this pioneer seemed to have established a hunting-ground of his own, where he found his chief delight, and from which he periodically emerged, urbane and impressive, trailing clouds of mysterious ether from regions remote.

The Constructor and the Tactician.

A third was again different. He suggested work-forges-trip hammers and tilting furnaces. His was the sort who waits till others have spoken, then hits the nail on the head with a single sentence. He was the constructor, the builder, the contractor. It did not appear that he would be much interested in anything that weighed less than a ton. A job might go wrong, and serious mistakes be made (by others), but I take it that he would silently unravel the tangle, then dismiss the culprit in tones of silk.

Again a different make-up. Conscious rather of obstacles than of opportunities—and therefore the complement of his fellows—he seemed the man of tactics; a shrewd man, far-sighted and presumably relentless in pursuit. He would I fancy, lick his lips at a legal difficulty, and turn in distaste from one in dielectics.

They followed each other, these pioneers, with whimsical recollections of old rivalries and battles. They did not say so, but it seemed that to their minds the engineer of to-day has easy going. That is a matter of question. They themselves were, fifty years ago, like children playing on some strange and fascinating shore, picking up a medley of multi-coloured pebbles, and staring wistfully seaward, wondering what lay just over the horizon's rim. Prophecy must have been there, but the prophetic instinct must also have been confused by the multiplicity of new marvels they found on this mysterious strand. "Why not?" must have constantly been on their lips.

A Perfect Exhibition of Detachment.

Another, a man of great achievements, was impersonal to a degree, and had a marked distaste for the usage of the first person singular, holding his own remarkable record, so to speak, at arm's length, till it was hard to associate him with the thing at all. It was a perfect exhibition of detachment. The cultivated voice recounted triumph after triumph, with lingering little touches from which he turned with a manner, which, if not apologetic, seemed at any rate to disclaim any personal credit. That was noticeable all through the meeting. The pioneers left it apparently to others to secure the credit—of both kinds. Then, too, we heard of scientific encounters between Saxon, Gaul, and Teuton. The Saxon held his own, but gave rather more than he got.

The Ageless Electrical Era.

Many of these men looked surprisingly young, considering their period of service. One is prone to accept the electrical era as something ageless, whereas it is the latest fledgling in the scientific incubator. Can it be that electricity—which one is now tempted to call a quality, and not merely energy—infuses its devotees with something of its own baffling and ubiquitous power? It is quite imaginable. Why should not the man who moves in an ionised sphere acquire thereby a species of psychopathic purging that eliminates from his body certain undesirable elements of decay? I noticed the same thing in America. Sprague, Edison, Brush, Thomson, and Bell, they all betray a sort of rejuvenation. If the gland of an anthropoid ape can rehabilitate the human body, in the approved Transatlantic phrase, "What is the matter with electricity?"

Nature's Camouflage.

As to the general run of engineers, it seems that Nature has displayed a good deal of camouflage. They have no distinctive personal insignia, which is, perhaps, fortunate. It would only arouse suspicion. Their brows are not more burdened with thought, nor do they display any particular profundity. Their fingers are apt to be square, and one could not call their shoulders round. They seem self-possessed, and that is often all they possess. They carry themselves in a manner that might be described as undisturbed.

As to monetary success, the rich engineer is a financial anomaly. He is too busy making—or spending—other

people's money to accumulate much for himself. He has an insurance policy, and leaves an estate of £2 748—with practically no liabilities. The latter is due to his wife, who knows that in her case she will never be able to regard liabilities with a light heart. The engineer, if he is a good one, marries young, and leaves to his real managing director everything but his own job. The managing director usually leads a one-handled life, and not infrequently asks why he is not more particular about his clothes, also if there is any reason why he should not make friends with the men whose wives she desires to meet.

Artifex Creator.

The true engineer accepts all this without a murmur, and the acceptance is one of his earthly triumphs. Possibly it is the greatest. He is what the Greeks called their poets—a creator. The thing—the ultimate, perfect thing—is glimmering in his eyes, and he hears a reiterant whisper of " Will it work ? " It is, in consequence, a little difficult to appreciate the true importance of the Ponsonby Smythe's dance on the 22nd.

One does not expect that a common purpose, however aspiring, will eliminate temperamental differences. I think it accentuates them; and if an engineer differs, he is apt—believing that his creed is threatened—to differ seriously. I would be much more comfortable discussing a point with a 'bus driver. The engineer is, too, likely to be a shade contemptuous, and evidences a touch of either pity or contempt for those whose views are divergent from his own. He cannot help this, because he believes that his own knowledge is founded on bed rock.

The Inferior Professions.

His admiration—whenever he harbours an emotion so spontaneous—is largely reserved for those of his own tribe. He considers that other professions—excepting only medicine—are inferior. He is unmoved by the sight of a millionaire, even though the latter be his own employer, and declines to admit that the man who rises to a baronetcy on, let us say, waves of resurgent yeast, can be either an ornament or an asset to his country. And yet he may be both. This, I think, is where many engineers fall short in the humanities of life. Their own job is so serious, so responsible, their failures when they occur are so obvious, their successes are so often to the profit of others, that they raise unconsciously an imaginary wall between themselves and the large, easy-going, and, on the whole, good-natured world. Every engineer should try and have amongst his friends a large-minded bishop, a manufacturer, a stock-broker, and a dealer in sporting goods. This would do much to enlarge his *clientèle*, and soften his mental asperities. He will find that the gentlemen I have mentioned are quite agreeable to the suggestion. They think far more of him than he realises.

Electrical Engineering.*

By J. PALEY YORKE.

Dr. Wall states in his preface that this book is intended to give a survey of the principles of electrical engineering which shall be as complete as is practicable in one volume of moderate size. He makes that clear too on the cover-sheet, but we do feel that the time has come when the title " Electrical Engineering " shall be declared as insufficient. For example, this book and Dr. G. W. O. Howe's book have the same title, but the treatment is quite different. Dr. Wall's book is much more engineering than Dr. Howe's, but on the other hand, Dr. Howe's book is much more technical than Dr. Wall's.

On turning over the pages of the book one's first impression is that it is simply a text-book in magnetism and electricity suitable for a student reading for his final. We wonder where the electrical engineering comes in, except in so far as electrical engineering is essentially based on the phenomena of nature, usually described under the title of magnetism and electricity. But when we settle down to read the book we realise that whilst it is a text-book on magnetism and electricity it is also a text-book which deals especially with those phenomena which are applied to modern electrical engineering practice, and which deals with them far more exhaustively than they are ever dealt with in a pure science book, and more exhaustively than they have been dealt with in any single volume of our acquaintance. We may at once express the opinion that the book is an excellent standard work on the principles of electrical engineering. It is intended for students in universities, and in the advanced classes of technical schools, and practising electrical engineers should find it useful as a reference book.

The work is divided into six main sections, dealing successively with static electricity, magnetism, direct-current electricity, electromagnetism, alternating currents and units.

Electrostatics and Magnetism.

The section on electrostatics covers 98 pages, and will, as is usual, cause the greatest amount of difficulty and the least amount of enthusiasm. But we agree with Dr. Wall when he emphasises its rapidly increasing importance to engineers and we hope that more recognition will be given by students and teachers to this previously much despised " sealing-wax and flannel " branch of the subject. The chapters on potential, capacity and energy of the electric field are particularly good, dealing especially with the capacities of cables of differing types and in differing circumstances: with dielectric strength and with electric stresses in cable dielectrics.

The section on magnetism is very complete, and the information given about magnetic alloys, cobalt, steel &c., and about ion losses appears to be quite up to date. In the direct-current electricity section, there are chapters dealing with first principles, electric resistance, electrolysis and secondary cells, and thermo-electricity. We are almost sorry to see the " Best arrangement of Cells " perpetuated—but this appears to be irresistible. We should like to suggest that in the next reprint some mention of the Benedick effect—the converse of the Thomson effect—should be made in the thermo-electricity chapter, and that credit should be given to C. V. Boys for the main idea of the thermo-galvanometer, even though he used it chiefly for radiation work.

Spartanlike Treatment.

The alternating-current section covers 150 pages, and in addition to the fundamentals has chapters dealing specially with harmonic analysis, magnetic fields due to alternating current, transient electric currents, and the use of complex quantities in a.c. problems.

Special attention has been given to the properties of magnetic shells and to Ampere's theorems of the equivalence of electric circuits and magnetic shells.

Altogether, as we have said, the book is a very complete and excellent work on the principles of electrical engineering. The treatment is certainly Spartan-like in its avoidance of stressing the practical application or importance of any special point. Dr. Wall will say that it is *all* important, and that the student who counts will not require any stimulus by direct reference to the immediate application of every point. We agree that it would be impossible to do this without producing an enormous encyclopedia; but on the other hand the majority of us are of baser clay, and most of us do work better for an occasional glimpse of the promised land, in spite of the lesson of Moses. We feel, for example, that we would have been stimulated quite a lot if Dr. Wall had just given us a peep at an electrostatic voltmeter after we had carefully and conscientiously waded through the theory of the quadrant electrometer. We hope that Dr. Wall will smile if he should read this—even though the smile be sadly indulgent.

We congratulate the publishers on having produced the book so well, and at such a reasonable price.

THE INSTITUTION JUBILEE COMMEMORATION.

Fifty Years of Audacious Progress—Two Outstanding Pioneers—Many Great Workers—Reminiscences of the Early Days—Honouring Heaviside—The President's Illness.

The Jubilee Commemoration of the Institution of Electrical Engineers, which was founded in 1871 as the Society of Telegraph Engineers, and whose first ordinary general meeting was held on February 28, 1872, took place on Tuesday, Wednesday, and Thursday last week. It was a happy idea to celebrate this fifty years of electrical progress by reviewing the efforts of the early electrical workers and, with the assistance of representative pioneers, who are still living, to give present-day members of the Institution some idea of the difficulties that had to be overcome and the mistakes that were made before that great machine, as we now know it, could be fairly started. Pressure on our space prevents us from dealing, except in an abbreviated form, with the remarks of the speakers, but these will be found in full in a forthcoming special issue of the "Journal" of the Institution. They will form not only an interesting but a useful record, for as the POSTMASTER-GENERAL said at the annual dinner, great as have been the advances in the past fifty years, who can place any limit on the possibilities of electrical science and art.

An Opening Tragedy.

The proceedings opened with a tragedy. For it became known on Tuesday morning that the President had been suddenly stricken down by illness and would be unable to play his full part in the proceedings. Apart from depriving the Jubilee of its principal figure, this was the more distressing as the conception of the commemoration in the historical form was Mr. Highfield's own. He can, therefore, be equally commiserated and congratulated, for the whole function was an entire success.

Quite rightly the name and work of Faraday were the first to be honoured, and quite rightly Prof. Fleming was called upon to carry out this appropriate task. On Tuesday afternoon and again on Wednesday evening he gave a lecture on "Michael Faraday and the Foundations of Electrical Engineering," in his own inimitable style. The lecture was a triumph of delivery and stage management.

Tuesday, Feb. 21.

On Tuesday afternoon the room was not crowded when Mr. A. A. CAMPBELL SWINTON took the chair and briefly opened the proceedings by saying that Prof. Fleming required no introduction as his invention of the thermionic valve had made him known over the whole world.

Michael Faraday.

Prof. FLEMING began by throwing on the screen a photograph of Foley's fine statue of Michael Faraday, which stands in the entrance hall of the Royal Institution, and reminding the audience that Faraday became connected with that institution as the assistant of Sir Humphrey Davy in 1813, when he was twenty-two years old. His earliest research work was chemical in character, but when in 1820 Oersted made the discovery of the magnetic field round a wire conveying an electric current Faraday solved in a very neat manner the experimental problem of making a magnet rotate continuously round a current-carrying wire and so gave us the first electric motor. He was thereby stimulated to endeavour to produce a current by the action of a magnet. After failing in his first efforts in 1824, 1825, and 1828 he at last succeeded on August 31, 1831, in his epoch-making discovery.

The Most Famous Ten Days in History.

He wound on an iron ring two tape-covered copper wires and found (1) that the passage of an electric current through one wire created a brief current in the other wire at the instant of starting or stopping the primary current. Following the clue in a series of experiments made in perhaps the most famous ten days in history, he discovered (2) that when a permanent magnet was approached to or drawn from a helix of wire so that the lines of magnetic force "cut" the convolutions of the coil it created in it an electric current; (3) that when a copper disc was rotated between the poles of a permanent magnet radial electric currents were set flowing in the disc, and could be drawn off by proper contacts. These three great discoveries developed in course of time in the hands of numerous inventors into the induction coil, and magneto-electric machine, and later on into the transformer, alternator and dynamo. Prof. Fleming showed all these facts experimentally to his audience, and also Faraday's experiment of obtaining an electric spark from a magnet and coil of wire. He also exhibited the ring magnet with which Faraday had conducted his early experiments, describing it as an almost sacred relic. The value of Faraday's work, he pointed out, lay not only in its intrinsic importance, but in the way he had collated the researches of still earlier pioneers, peptonising them and clarifying them in a way which made us forgetful of the genius which unravelled and enumerated the most fundamental electrical facts. His most valuable investigations were conducted with no other goal than a disinterested desire for scientific progress, and it was worthy of note that Faraday told us not only of his successes, but of his failures and his lines of thought. An instance of this was the way he developed the idea of self-induction from a chance question made to him by one of his audience after a Royal Institution lecture, the only occasion, he himself said, when a question from such a source had started a useful train of thought.

Faraday's Electrostatic Discoveries.

He then explained and showed experiments to illustrate some of Faraday's discoveries in connection with electrostatics, especially that of the specific inductive capacity of insulators, which, however, had been anticipated sixty-six years previously by Henry Cavendish, but were not published until some years later, when they were discovered by the Duke of Devonshire.

Following this attention was directed to Faraday's great investigation in connection with electrochemistry, and especially his two laws of electrolysis (1) that when a current flows through an electrolytic cell the mass of the ions deposited on the electrodes is proportional to the quantity of electricity which was passed, and (2) that when a number of electrolytic cells are joined in series the masses of ions deposited in each are proportional to their chemical equivalents. Von Helmholtz pointed out in 1881 that these laws of Faraday prove that electricity was atomic in structure.

Electro-Optical Work.

Referring then to Faraday's electro-optic and magnetic work, the audience were shown the great experiment Faraday called the "magnetisation of a ray of light." A ray of plane polarised light was transmitted through a bar of Faraday's heavy glass, a boro-silicate of lead, which was placed between the poles of a powerful electro-magnet. On exciting the magnet it was seen that the plane of polarisation was rotated. Both Kelvin and Maxwell considered that this discovery of Faraday proved that some kind of rotation was taking place along lines of magnetic force. Some of Faraday's leading investigations on magnetism were next described, a view of his large electromagnet being shown on the screen.

Faraday and Wireless.

Prof. Fleming then alluded briefly to Faraday's theoretical views on lines of electric and magnetic force and showed how the translation by Clerk Maxwell of those views into mathematical language led the latter ultimately to enunciate his celebrated theory of the electromagnetic nature of light, and thus paved the way for the discovery of electromagnetic waves and the invention of wireless telegraphy.

Faraday's opinions and researches on a possible connection between gravitation and electricity were then mentioned, and it was pointed out that Einstein's theory also had predicted a connection of this kind, which was confirmed at the total solar eclipse of May 29, 1919, where it was found that a ray of light, which was an electromagnetic wave, was deflected slightly by the mass of the sun.

Faraday the Man.

Eulogising the character of Faraday, Dr. Fleming said that he had made posterity his debtor not only by his achievements, but by his personality. He therefore appealed to the audience to support the research work of the Royal Institution. That institution was without rival in the world for the enormous value of the scientific discoveries which have issued from its laboratories, and the ridiculously small cost at which these results had been attained. Sir James Dewar stated lately that the whole cost of maintenance of the institution during the last 120 years has been little more than £100 000, not a twentieth part of the cost of one battleship. Yet the discoveries of Faraday alone, Professor Fleming concluded, had put untold wealth into the exchequers of nations and laid the firm foundation on which rests to-day the entire work of the

modern electrical engineer. He therefore appealed to the largest and one of the youngest of scientific institutions to help one of the oldest.

A Founder Member on Faraday.

Sir HERBERT JEKYLL, who is one of the founder members of the Society of Telegraph Engineers, in proposing a vote of thanks to Prof. Fleming, said that he had attended as a boy Michael Faraday's Christmas lectures at the Royal Institution. He had been struck by the extraordinary simplicity and kindness of the man himself, and his willingness to answer the questions asked by eager youngsters at the end of the lectures. To those youngsters he had always something to give, even if it was only a little piece of magnetised wire. His essential kindness was also shown when at the end of a dull lecture he had spoken for half an hour on the lessons of the halfpenny and sent away a bored audience in a state of good humour. But great as Faraday was as an inventor, he was equally great as a man, so that not only by his achievements, but by his personality, had he made posterity his debtor.

By the kind permission of the Royal Institution some of Faraday's original apparatus was exhibited in the Lecture Theatre and Common Room, while models of a number of early dynamo-electric machines, and one of the first Parsons steam turbines, which were lent by the Science Museum at South Kensington, were also on view

Wednesday, Feb. 22.

On Wednesday afternoon Dr. W. H. ECCLES, presided over the meeting and expressed regret at the continued absence of the President. If Mr. Highfield had been present he would have treated them from the store of his memory to some introductory address upon the Commemoration, but without having had any opportunity of preparing such an address, and without, indeed, the experience Mr. Highfield possessed, he (Dr. Eccles) did not propose to touch on the subject, but recommended every person present to peruse the programme, which gave some particulars of the Institution's history and objects. He called on Colonel Crompton to give his reminiscences.

Colonel Crompton's Reminiscences.

Colonel R. E. CROMPTON began by referring to the fact that there was at least one older member than himself present, viz., Mr. A. P. Lundberg, aged ninety-one..

Continuing, Colonel Crompton mentioned that he had installed Gramme dynamos and Serrin lamps as early as 1878 at the Stanton Ironworks, obtaining the necessary technical knowledge for the purpose from the telegraph engineers. Some of the ideas were strange, notably the impression that a certain internal resistance was essential to the production of an E.M.F. In 1878, he went to Paris and joined in a discussion on electric lighting, and in 1879 he met Emil Burgin, of Basle, and took up the manufacture of his form of dynamos, which were undoubtedly better from a mechanical standpoint than the Gramme machine. Very soon they were turning out several Burgins a week at Chelmsford, and they always sold several Crompton arc lamps with each dynamo. Then the works were enlarged, and Gisbert Kapp was taken on as manager. Subsequently he met Swan, who was developing his lamp company, with which the Edison interest was ultimately amalgamated. The first regular installation of electric light in a country house was apparently at Berechurch Hall, belonging to Coope the brewer. A number of bell-hangers were turned on to electric wiring and eventually became electrical contractors. The remarks that had been appearing in the papers recently about the first electrically lighted house were all wrong. His own house had been lighted before either those of Sir Wm. Crookes or Lord Randolph Churchill.

Early Magnetic Calculations.

Ideas of calculating magnetic fields were very vague at that time. He (Colonel Crompton) believed that bigger cores of softer iron should be used for armatures and magnets, but Kapp did not agree. In the latter's absence he made a machine with gigantic wrought iron field magnets. On Kapp's return it was tried and proved a success, and the modern dynamo was born. Meantime, Hopkinson had been working on the same problem, and they both exhibited at Kensington.

The burning of the Ring Theatre in Vienna led to the Imperial Continental Gas Company in Vienna taking up electric lighting, and he had joined with Monier, a French engineer, in devising a suitable central station. The Allgemeine was then just starting, and he often met Rathenau and Deutsch in Vienna, with the result that he tried to apply his Continental experiences in lighting parts of London. Want of capital hindered these projects, but eventually the Kensington Court Electric Lighting Company (the first real lighting company) was formed. About the same time, Ferranti and Lord Crawford started distributing alternating current from the Grosvenor Gallery. At the latter many extinctions occurred, but he (Colonel Crompton) had accumulators in reserve at Kensington and they scarcely ever had a failure.

The Dynamicables.

In 1883, a dining society, the Dynamicables, was formed, and practically every man of note joined. (One duly elected member was found, when he died, to be a woman !) At the Dynamicables many interesting problems were discussed. About this time the potentiometer was evolved. Interesting competitions between rival dynamo-makers took place on the test bed at Willans' works at Thames Ditton, yielding valuable data on efficiency, and showing that England at this time was in advance of any nation in this form of machinery. When mains were first laid in the Kensington Court subway, bare copper conductors were stretched over porcelain insulators. Many miles of small subways under the pavements were constructed, and after forty years were still in use. There were, however, troubles in the surface boxes—especially in the neighbourhood of leaky gas mains.

Electricity Supply in Westminster.

Sir ALEXANDER KENNEDY began his remarks by paying a tribute to the assistance given in the early days by Colonel Crompton, who had put his experience at the service of everyone, which was more than most people did. Electricity supply in Westminster began in a small shanty in Dacre Street, another in Chapel Street, and a third in the Stone Yard of the Houses of Parliament, from which a supply was given to the building. This was in 1890. In 1891 the company had a total income of £2 600, and their greatest energies were employed in fighting Ferranti. One of the few notes of the combat that he had found remarked that in Millbank-street 7·75 lb. of coal per kW were being used, which was less than half the best " high tension " result.

Early Interconnection Problems.

The great question in those days was whether two stations could be paralleled. As a mechanical engineer he could not see why not, but electrical engineers were very doubtful about it. Colonel Crompton knew perfectly well that it could be done, but had not done it—apparently because he did not want to. In February, 1891, the great experiment was carried out of connecting the Dacre Street and Stone Yard stations, but nothing happened—to many people's great astonishment. In December, 1891, the conversion of the old two-wire system into the three-wire system was completed. At that time a 112 kW machine cost from £1 700 to £2 300, and there were only two makers in the country who were prepared to tender for 250 kW dynamos.

Vibration and Psychology.

Noise and vibration were great troubles, and gave rise to some amusing incidents. There were loud complaints from residents in Milbank of the vibration and noise from machines which had never been run. A doctor in Brook Street complained of smoke, but when asked to say when he had seen any smoke he replied he had never seen any, but there must be some because there was a chimney. In this district vibration tests were made which gave the extraordinary result that the greatest vibration occurred when the station was shut down, *i.e.*, it was caused entirely by wheeled traffic. A doctor's housemaid stated that whenever she opened the door she could hear the current roaring in the mains underneath the pavement, while another doctor complained that the current supplied caused showers of sparks in the incandescent lamps. He did not realise that his lamps were broken.

On another occasion one of the engine-drivers broke off the stop valve of his engine and said nothing about it. As the lamps were turned off the engine went faster and faster and the voltage went up and up, with the result that Mr. Grimshaw and his assistant spent the next day going round with a basket replacing the lamps.

Dynamos and Early Electric Traction.

Sir OLIVER LODGE gave some of his experiences as an electrical engineer, a *rôle* in which he is rather unfamiliar to readers of THE ELECTRICIAN. In early days they discriminated between the dynamo-electric machine which had electromagnets and the magneto-electric machine which had not. The term " dynamo " was first adopted by Lord Kelvin in a Paper which he read before the British Association. Lord Kelvin was extraordinarily immune from electric shock. On the occasion when he, Fitzgerald and Sir Oliver were inspecting the first electric railway between Portrush and Bushmills, on which the working pressure was 500V., Fitzgerald and Sir Oliver suffered from shock, while a cow was killed. Lord Kelvin, however, could feel nothing at all and asked them what they were jumping about for. It was only after he had gravely placed his hand on the rail that he said after a pause: " I think I do feel a something," reminding one irresistibly of the cheese and the charwoman in " Three Men in a Boat."

Sir Oliver also gave his recollections of the first battery vehicle which refused to take a bend in the road and went straight across the street into a shop window opposite. The next day it took the bend but caused trouble with a horse-driven milk cart, as the

horse could not understand why it went along without any visible means of propulsion.

Heaviside and "The Electrician."

Resistance units, current units, voltage units, all came in gradually, Sir Oliver continued, but it took a little time to get the idea of self-induction into the minds of early workers, especially those in the telegraph service. Sir William Preece was very much annoyed with Oliver Heaviside for emphasising the importance of induction in cables, and it was certain that the work of Heaviside had not received even now its due share of recognition. For while Lord Kelvin gave the theory of cables, and made the first cables possible, he did not attempt to take self-induction into account. Heaviside did, and showed that whereas resistance and capacity together were a bugbear and distorted the signals so that they travelled at different rates and had different frequencies, and therefore speech through a long cable was impossible and ordinary signals were liable to be greatly confused, the effect of self-induction would be just the opposite. It would neutralise the effect of capacity, and by loading the cable by introducing self-induction on purpose the damage done by capacity and resistance would be reduced. Everyone knew now that loaded cables were used for telephonic purposes, but a great deal more could be done by using self-induction in cables to increase the speed.

Fitting Recognition of a Great Work.

Concluding, Sir Oliver remarked that Mr. Heaviside was still living in Devonshire in very bad health and he understood in poor circumstances. At this anniversary of electrical engineers it would not, therefore, be improper to suggest that a message be sent to him expressing the Institution's recognition of the mathematical work—the very brilliant mathematical work—which he had done, and which appeared for many years in The Electrician and in his book. His work was far in advance of his time, but it had borne practical fruit in the hands of practical men. Mr. Heaviside himself was not a practical man, but a theoretical genius of a very extraordinary type.

Mr. Campbell Swinton said that during the last week or two the Institution had been in touch with Mr. Oliver Heaviside, with a view to doing him some honour. They were not yet in a position to say what he would like or what he would accept, but the point would be raised later. The question of sending a greeting to him from one of these Commemoration Meetings would be considered.

A Broad View of Electricity.

Mr. Garcke commented on the remarkable fact that, notwithstanding the millions of pounds expended on applications of electricity, we still knew little of its essential nature. It was conjectured that all matter was electricity, and the Institution, true to its broader policy, provided opportunities for the discussion of these philosophical speculations. Electricity was not invented by man. It never was "in its infancy." But its application had been gradually developed. It was difficult, therefore, to see why it had been treated in such a narrow parochial manner. Electric supply was usually dated from the Electric Lighting Act of 1882, but this Act was based on the earlier Tramways Act (1870), and to understand this we must go back about 100 years.

The Tramways Act.

After the Napoleonic wars the prevailing distress necessitated the stimulation of industries and the progress of invention. The extension of public utilities was encouraged, and simultaneously an impetus was given to local government. Hence horse tramways were controlled by the Tramways Act, which had unexpected consequences. It contemplated municipal ownership, but not the operation of tramways by municipalities. The latter extension occurred afterwards. But in connection with electricity supply the precedent was followed. Thus the pernicious Act of 1882 was conceived. Politicians were stupid in their legislation, but were the scientists wise in their outlook? The basic trouble of electricity supply arose from having to open streets to lay conductors, which necessitated a bargain with the community. Had we been able to think more in terms of electromagnetic waves and less in terms of conductors subsequent developments might have been different.

The Story of Electrical Legislation.

The Act of 1882 was not amended until 1888, and then only imperfectly, and the Light Railways Act, which might have been helpful, was interpreted in the terms of the Tramway Act. The story of electrical legislation had been often told. Perhaps the best general description was that conveyed in Mr. Campbell Swinton's address to the Royal Institution in 1912. The future depended on the breadth of view we were able to apply to our interests. Structures developed were often unequal to the functions undertaken. International arrangements were needed for the stabilisation of currencies, the rehabilitation of confidence and credit, for better distribution of raw materials and for intensive production. Apart from such international arrangements, the supreme need of the nation was for better and more sympathetic all-round co-ordination. How could electricity help in the work of rehabilitation? The Ministry of Reconstuction two years ago gave us a lead, remarking that the public mind had been prepared for a large development of electricity supply which would conserve coal and human resources. Power and transport were fundamental agencies of modern economic life. Adequate and cheap power supply, widely distributed throughout the country, would open up possibilities comparable with those of the industrial revolution of a century ago.

"The" Electric Light.

Mr. Sydney Evershed stated that forty years ago his work lay outside the electrical field, but as a spectator he was even then impressed by the vision of the strange new world of electricity developing in the seventies and eighties. He proposed to select from a crowd of memories three disconnected incidents.

In those days people always spoke of "the" electric light in the singular, because they seldom saw more than one arc light. One could not light one's house with arc lamps, but everyone talked of the time when electric light would be available in more manageable units. He remembered reading an excited cablegram from America announcing that Edison had solved the problem by the invention of an incandescent platinum filament. According to popular accounts, the great inventor spent months of fruitless effort, never going to bed, until the problem solved itself—by the accidental dropping of a screwdriver or something of that kind. In contrast with this feverish picture, a quiet man in England was working patiently at the invention of the carbon filament lamp. He would never forget his first sight of the Swan lamp, when some leather mills in Godalming were lighted in this way in 1881. More Swan lamps were used in the smaller streets, but the main streets were lighted by arc lamps. The cables were merely laid in the gutter with no protection against the wheels of carts or the hooves of horses. Ultimately, of course, they were put under the pavement, but this was not permissible until the passing of Chamberlain's notorious Electric Lighting Act, with its unfortunate arresting influence on future developments. In the long list of past-presidents of the Institution there was no name more honoured than that of Swan, the father of domestic electric lighting.

Telegraphy and Telephony.

Telegraphy, Mr. Evershed next remarked, had had a long and curious history. It began as a wireless telegraph, an optical system. His first recollections of electric telegraphy were in 1866 when each morning his father used to read out from the newspaper the account of progress of the ship laying the Atlantic cable. It was good to remember that this pioneering work was done almost entirely by our own countrymen.

It was in 1876, the year of the Centenary Exhibition at Philadelphia, that he first heard of Graham Bell's telephone. A year later he saw a drawing of the apparatus and marvelled at its simplicity, and at once set to work to make one for himself. A young lady eleven years old acted as girl telephone operator. How wonderful it was when her small voice answered him quite distinctly! Since that day much of the glamour has been rubbed off the telephone. Its defects had been attributed to the authorities for mismanaging it, but it would be nearer the truth to say that our telephone service, with all its shortcomings, was a faithful reflection of our national temperament. But the marvel of this invention remained. Was ever so profound an influence on our daily life brought about by such simple means? He could think of no invention made by man that approached it.

Gordon's System of Electricity Supply.

Mr. A. H. Walton, recalling the old discussions on the relative merits of d.c. and a.c. supply, referred to the historic work of J. E. H. Gordon in putting down a single phase a.c. lighting installation at Paddington in 1884. Their only a.c. instruments in those days were the Siemens dynamometer and a Cardew hot wire voltmeter, and calibration was difficult. In fact, it was usual to rely on the judgment of observers as to when a standard lamp was fully incandescent.

Mr. Walton described the generators installed, which were of about 400 kW. at 150 V., running at 180 revs. per min., and giving 42 cycles per sec. The speed, however, was reduced to 146 revs. per min. owing to engine troubles. The machines were direct coupled to compound tandem engines and the field, or rotating part, weighed some 22 tons. It consisted of 56 drum type coils, twenty-eight being mounted on each side of a wrought iron disc built up of boiler plates. The stator consisted of wedge shaped coils wound on a hollow core of wrought iron, twenty-eight coils being used on each circuit of each side of the machine. The hollow

cores enabled internal water-cooling to be used. The weight of each machine was about 45 tons. Three exciters each of about 25 kW were used, their speed being varied according to the load on the alternators. Paralleling alternators was certainly tried, but without much success, the circuits being divided and connected to different machines. A feature of the wiring was the use of Gordon's multiple or "divided main." The voltage drop in feeders to passenger and goods centres was 20 per cent., and to the locomotive centre about 33 per cent. To obtain this drop the section of the divided main was varied by cutting in or out the individual strands of the cable. This method of keeping voltage constant at a given point by altering the section of the feeders seemed worth consideration even in these days.

Early Arc Lamps.

For the lighting of offices and the Great Western Hotel 4 115 incandescent 25 c.p. lamps were used; in the passenger and goods stations and various yards 98 arc lamps each of 3 500 c.p. In addition two arc lamps were installed at the four corners of the Great Western Hotel. Difficulty was experienced in finding a suitable arc lamp, and the mechanism of the original Crompton d.c. lamps was altered, the positions of shunt and series coils being reversed, and two laminated cores substituted for a single one. Lamps were operated two in series with an inductive steadying resistance. Carbons were originally obtained from Vienna, afterwards from Le Carbone, of Paris. Even at that time the incandescent lamps were subjected to elaborate photometric tests before contracts were awarded.

The plant was started up in 1885 and various alterations had to be made in the generators, one event being a complaint by neighbours of excessive vibration, as a result of which Mr. Justice North, who was hearing the case, paid a surprise visit and inspected the plant. There were other difficulties, and the running of plant during the experimental period usually involved 12 to 15 hours per day attendance on the part of the staff. The old and historic plant has now been replaced, but it would always retain a place in the pioneering of electric lighting in this country.

Submarine Telegraphy—1869-1919.

Mr. Walter Judd then reviewed progress in submarine telegraphy from 1869-1919—fifty years during which he had been intimately connected with the subject. In March, 1869, the only ocean cables were three, across the Atlantic, but later in the year communication was established with Egypt, in 1870 with India, Malaya and Japan, in 1871 with Cochin China, Hong Kong and Australia; in 1876 with New Zealand; in 1879 with South Africa. With these enterprises the name of Pender would always be identified. Other countries also entered the field. The Pacific Ocean had been spanned from North to South, and from East to West, and there were now 305 000 miles (71 000 Government owned) as compared with a possible 10 000 in 1869. This included all submarine cables, the great bulk of which were manufactured in this country.

Cables to-day were of the same general type as in 1866. But developments, recommended by Heaviside, had increased the ratio of copper to gutta-percha from 300 (copper) to 400 (gutta-percha) in 1866 to 700 (copper) to 360 (gutta-percha)—the highest known to-day. In shallow tropical waters cables were attacked by boring worms, a difficulty overcome by lapping the cable with thin brass tape. The inclusion of inductances in deep-sea cables had been considered. It had been also suggested that if a consistent constant and weatherproof insulator with a dielectric resistance of a few hundred thousand ohms instead of many thousands of megohms could be found, a cable with small retardation and distortion without excessive attenuation could be secured. Apparently neither method had yet been used, but finality had doubtless not yet been attained.

The Work of Kelvin.

Lord Kelvin, in 1865, solved the problem of operating cables when laid. His mirror galvanometer was for some years in general use, until displaced by the siphon recorder. Both instruments were substantially unaltered to-day. Modern apparatus for operating cables had, however, lost its pristine simplicity. The first great change was the introduction of duplex, but after laying an artificial line having the closest reproduction of the electrical constants of the cable, the art of obtaining balance on a long cable still depended greatly on the skill of the operator.

After referring to progress in relays and magnifiers, Mr. Judd remarked that there was a tendency to revert to the Morse code instead of the cable code hitherto universal on long cables by adapting the Gulstad principle to more sensitive apparatus.

Finally, Mr. Judd declared that only those present at the first landing of a cable connecting new areas of the globe could realise the excitement and pleasure produced. The social effects of such connections in lessening feeling of distance and isolation had been very marked. Submarine telegraphs played a most important part in the war, and great credit was due to those who faithfully carried on this essential work.

On Wednesday evening Prof. J. A. Fleming again delivered his lecture on "Michael Faraday and the Foundations of Electrical Engineering," an account of which is given above.

Thursday, Feb. 23rd.

On Thursday afternoon the reminiscences of the elder brethren of the electrical industry were continued, but before these began Mr. C. C. Paterson, who was in the chair, called on Dr. W. H. Eccles to move a resolution.

A Tribute to Heaviside.

Dr. W. H. Eccles said that Sir Oliver Lodge had suggested, at the meeting on the previous day, that a message should be sent to Mr. Oliver Heaviside conveying the appreciation of the electrical engineering profession of the important theoretical work that he had done. After an informal discussion the Council agreed with Sir Oliver's suggestion. Continuing, Dr. Eccles said that Mr. Oliver Heaviside's work consisted in introducing Maxwell's theory to a public who were not schooled in Maxwell's methods, by the vehicle of a vector algebra which was simpler than the orthodox mathematical methods of Cambridge. Unfortunately, orthodox mathematicians found Heaviside's methods more difficult than their own and poured cold water upon them. This lack of recognition was assisted by the neglect the work received in our engineering colleges. On the Continent matters were different. Lorenz had at once adopted Heaviside's methods, and now even pure mathematicians were employing them.

Telegraphy and Wireless.

It might in fact be said that both on the mathematical and physical sides Heaviside was forty years ahead of his time. The phenomena of submarine cable telegraphy were badly understood, and his suggestion that self-induction might be incorporated in cables in lumps so that conversation could be effected without distortion over a three or four times greater distance than when such methods were not employed had now been proved amply justified. It was only right to point out that Heaviside gave his information to the world at large without any attempt to make money out of it. In wireless telegraphy, too, he had done pioneer work. There had been much scoffing at the suggestion that wireless communication between, say, England and Canada was possible, it being thought that the mountain of water 150 miles high that lay between the two countries would be an effective obstacle. It had now been shown that the upper atmosphere was permanently ionised and was as good a conductor as water. He (Dr. Eccles) had termed this section of the atmosphere the Heaviside layer as some recognition of its discoverer's labour. He therefore moved:

> That the members of the Institution of Electrical Engineers assembled at the Commemoration Meetings being held to celebrate the fiftieth anniversary of the first meeting of the Society of Telegraph Engineers (now the Institution of Electrical Engineers), with their thoughts directed to all those who in earlier days laid the foundation of the science and industry which the Institution represents, desire to send a message of greeting and remembrance to Mr. Oliver Heaviside, F.R.S., Honorary Member of the Institution.
>
> In the course of the meetings they have been again reminded of and have recognised the great importance of the classic work achieved by Mr. O. Heaviside, and published by him in his papers and writings from 1887 onwards, and especially of his discovery of the importance of inductance in circuits for the transmission of telegraphic and telephonic signals without distortion, and of him as the originator of the methods now being universally applied for this purpose; and in no less measure of his investigations and discoveries relative to the propagation of electro magnetic waves in space, the results of which are now being utilised in wireless or space telegraphy and telephony.
>
> They are convinced that, as now so in the future, the name of Heaviside will be one of the names which will rank among those of the great founders of the science of applied electricity.

Mr. Llewellyn Atkinson, who seconded the resolution, said that he remembered Heaviside's Papers when they were published in The Electrician in 1887. Maxwell had said that every advance in pure mathematics had resulted from attempts to solve practical problems. In attempting to solve successfully certain physical problems the classical methods of mathematics had failed, and Heaviside had spent much time in suggesting a new vector algebra to deal with them. It should be pointed out that even non-mathematicians could learn from his statements of results even though they might not understand his mathematics. It was obvious that Heaviside had not been recognised as he ought to have been.

The resolution was carried with acclamation.

(To be concluded.)

Rotary Converters, with Special Reference to Railway Electrification.*

By F. P. WHITAKER.

Introduction.

The consideration that is being given to railway electrification makes this an opportune time for reviewing the problems of conversion. Success in such involved schemes depends largely on the supply of power at low cost, making it essential for power to be generated with a high load factor. It will thus be advantageous in this country for the frequency of supply to railways to conform to the standard frequency of 50 per sec. wherever possible. Frequencies of 25, 40 and 50 per sec., and a d.c. pressure of 1 500 V are probable. Abroad requirements may demand an operating pressure of 3 000 V (d.c.).

Converting apparatus for railway substations, besides being economical in first cost, maintenance and floor space, should preferably possess the following characteristics : —

High efficiency :

Capacity for carrying large overloads, more especially if situated in outlying substations ; reliability and power to withstand ordinary overloads and short-circuits incidental to railway working :

A d.c. voltage as free as possible from ripples and undulations, so as to avoid interference with telephone and other circuits ; high power factor, preferably unity or leading at loads above three-quarter load ; d.c. voltage be maintained at a reasonably constant value up to heavy overloads :

Plant should be capable of being built for operation on systems of 25 to 50 per sec., whether from local supplies of 6 000 to 10 000 V

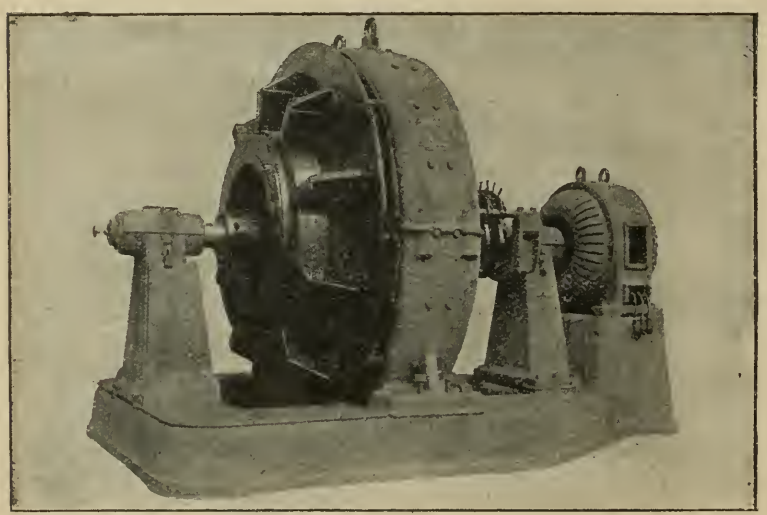

Fig. 1.—View of a 1 200 kW unit. Two 600 kW Machines in Series.

or from extra high-tension feeders at still higher voltages, with practically equal efficiency ; should be suitable for the application of automatic control ; should be simple to operate and capable of being started up and connected to the d.c. bars in a short time.

If regenerative braking is found to be advantageous in a particular district, the equipments must be suitable for inverted operation.

The rotary converter has become the recognised conversion unit on 600 V railway systems operating from 25, 33 and 40 period systems, and the Paper aims at showing how far the modern rotary converter specially developed for the more exacting requirements of 1 500 V d.c. can fulfil these conditions of service even when operating from 50 period systems.

Effect of Frequency and D.C. Voltage.

There is a practical limit to the average voltage that can exist between adjacent commutator segments ; the number of segments will increase with the d.c. voltage to be generated, and likewise the distance between brush-arm centres. Further, for a given distance between brush centres the peripheral speed of the commutator will increase proportionately to the number of periods. Thus the distance between brush-arm centres and, therefore, the peripheral speed of the commutator will increase with the d.c. voltage, and, further, the peripheral speed of the commutator will increase with the number of periods.

For the maximum permissible value of the average voltage per segment, the Author suggests approximately 13 V for the higher-frequency rotary converters, and 15 V for the lower-frequency machines. Peripheral speeds of 6 000 ft. per min. have been adopted and have proved quite satisfactory. Speeds of 8 000 ft. per min. have been used experimentally over prolonged periods with heavy loads with excellent results ; if advantageous, such speeds may become common in the future. If we assume 13 for the maximum permissible value of the average voltage per commutator segment, and 8 000 ft. per minute as a limiting value for the peripheral speed of the commutator,

then $$V = \frac{8\,000 \times 13}{2f} = \frac{50\,000}{f} \text{ approx.}$$

i.e., the maximum d.c. voltage that can be conveniently generated in a rotary converter with a single commutator is approximately :

Periods :	15	25	33	40	50
Pressure :	3 500	2 000	1 500	1 300	1 000

Frequency and Machine Units.

On 25 periods the generation of 1 500 V direct current has been accomplished in single-armature converting units, and such practice can be extended up to approximately 33 periods. Above this frequency it is necessary to connect two 750 V rotary converters in series, or one single-unit motor converter could be used for such duty, as in that case the frequency to be taken in the above formula is that of the armature of the motor converter, and not that of the supply.

In the case of series connection of rotary converters, the capacity of each machine will be half that of the complete unit, and the machine will be supplied from a separate winding on the secondary of the transformer. For complete unit of about 1 200 kW capacity and above, series working is suitable, but below this capacity the individual machines become too small for the satisfactory generation of 1 500 V direct current.

The series connection increases the floor space required per kW, and this may be a limiting condition in some cases, but in other cases it may be advantageous on account of the reduced weights of each part.

The generation of 3 000 V d.c. will generally be associated with a supply frequency of 50, and with relatively long a.c. transmission. For such duty the synchronous motor-generator set is the most serviceable unit. The voltage of 3 000 could be generated on one commutator, but it is more economical to generate such a pressure by connecting two 1 500 V generators in series, each generator operating at about 25 periods per second.

The Effects of 1 500 V D.C. on Converter Design.

The effects of 1 500 V d.c. on the detail design of converters are that the general proportions of both 25 and 50 period converters will not be seriously changed with the increased voltages ; a larger number of conductors of smaller section will have to be accommodated on the armature ; increased space will be required for insulation ; creepage distances will be increased, and the peripheral speed of the commutator will be higher.

These modifications will no doubt lead to slightly larger dimensions for the same rating and speed as compared with, say, 600 V machines, but the general operating characteristics such as commutation, efficiency and power factor will remain unchanged.

A limiting condition, however, in railway working is that of short-circuit. Liability to flash over is to some extent controlled by detailed design, but even when the most conservative figures are used, high-voltage machines will flash over when subjected to short-circuits, if protected by the ordinary type of switchgear. If the load is increased beyond a certain limit, serious sparking results. Also, if large loads be very suddenly applied, the normal balance between a.c. and d.c. armature reaction is upset and this tends to produce sparking.

Under partial or complete short-circuits the machine has momentarily to withstand currents beyond the commutating limit, and the armature reactions are seriously unbalanced. This results in an arc being drawn between the commutator segments and the brush-tips and adjacent metal parts.

Such operation would prove a serious limit to the generation of high-voltage d.c. with the ordinary apparatus, and it would seem necessary to modify the normal design so as to make machines more self-protecting.

* Abstract of a Paper read before the Institution of Electrical Engineers.

The N.E.R. Rotaries.

Manufacturers have approached this matter in various ways. Three 800 kW 1 500 V rotary-converter equipments were originally supplied to the North-Eastern Railway for operation on the Shildon-Newport electrification, from the local supply system at 40 periods. Each unit consisted of two 400 kW, 750 V rotary converters connected in series. It was recognised that the short-circuit conditions, especially in the early days of the electrification, might be severe, and, consequently, the machines were built with a completely insulating and fireproof screen between the commutator and the rest of the machine, so that, in the event of flash-over, the arc would not penetrate into the more delicate parts of the machine.

Fig. 2.—View of Machine under complete short circuit.

Good clearance was provided between the positive and negative brush arms, and the operating details of the brush-gear were well protected.

The commutation was quite satisfactory up to three times full load. Originally the a.c. side of the machines was protected by a time-limit device with a view to clearing all short-circuits on the d.c. side. In practice it was found that these machines would take partial short-circuits up to about five times full load without flashing over, but above that point flashing over would result, and it was found advisable to reduce the severity of the flash by the use of instantaneous trips on the a.c. side of the machine.

Later an opportunity was presented for installing a larger set, viz., a 1 200 kW unit (two 600 kW machines in series) having various novel features. The diameter of the commutator was made practically the same as that of the armature, the armature bars being sweated directly into the commutator. It is impossible for the conducting vapour produced under short-circuit to penetrate inside the armature and cause subsidiary short-circuits. A propeller fan at the back of the commutator directed a strong blast of air axially over the commutator surface. The d.c. brush-gear was completely enclosed inside cast metal brush-holders which are practically immune from damage due to flash-over. Fig. 1 illustrates one of these machines.

Advantages of this construction are: The conducting vapour produced under short-circuit is rapidly swept away by the blast of air, thus reducing the chance of flash-over when the d.c. voltage is restored on the opening of the d.c. circuit breaker. In the case of flash-over the resulting damage is almost negligible. The arc has not been known to restrike. The conducting vapours are blown away from the important parts of the machine, so that subsidiary short-circuits are not produced. The short-circuit is cleared so quickly that in most cases it is cleared by the d.c. circuit breaker, and the machine is left running on the a.c. side.

Special Features of the Design.

The following features were incorporated in the design of these machines: The distance between the centre line of the armature and the base-plate was made as large as possible, so as to give a large clearance between the brush arm and the base-plate and provide for air space all around the commutator. The distance between the commutator and the bearing pedestal was made large, and the pedestal and base-plate were shielded with insulation, to prevent the arc striking to earth. No part of the yoke for the brush brackets projects over the commutator, and this yoke is separated from the commutator and brush brackets by a thick layer of insulating material. The commutator segments are provided with arcing tips to prevent the deterioration which takes place at the ends of the commutator bars during flash-over.

When on test at the works this machine was coupled to a large turbo-alternator, and loaded up to full load on a water box. It was found possible to "dead short circuit" this machine, clear the short circuit on an ordinary circuit breaker, and leave the machine running on full load. Immediately after several short-circuits the machine would carry three times full load with good commutation. Fig. 2 shows the appearance of machine under complete short circuit.

These machines have now been in operation for approximately four years; their performance has been excellent, and the cost of maintenance is very low.

Magnetic Removal of the Arc.

We have recently experimented with a construction for magnetically driving the arc from the commutator surface. This scheme was applied to a 750 kW, 1 500 V compensated generator. When protected with an ordinary type of circuit breaker, it was found possible to short-circuit this generator completely when separately excited on the shunt winding, with or without the compound winding, without the slightest damage to the machine (see Fig. 3).

All the above developments have been in the direction of making the machine itself more robust and self-protecting. The high-speed circuit breaker is an external apparatus to protect the machine. Its successful operation depends on limiting the period of short circuit and derangement of commutating conditions to such a small fraction of a second that very little conducting vapour is produced around the commutator and there is little danger of the arc striking when the pressure is restored by the disconnection of the short-circuit.

In the original article the author presents a diagram illustrating the performance of a 1 500 kW, 1 500 V unit, operating on either 25 or 50 periods. The curves relating to regulation, power factor and efficiency are based on the fulfilment of the following requirements: Full load continuously with less than 40 C. rise; 25 per cent. overload for 2 hrs; 50 per cent. overload for 15 min.; 100 per cent. overload for 3 min.; 200 per cent. overload for 20 sec.

The Importance of High-Power Factor.

Importance is attached to a high-power factor. Provided reactance between the h.t. line and slip rings of the rotary is not too large, the power factor of rotary-converter equipments on the h.t. side can be maintained at unity power factor, even up to three times full load, without appreciable loss in efficiency.

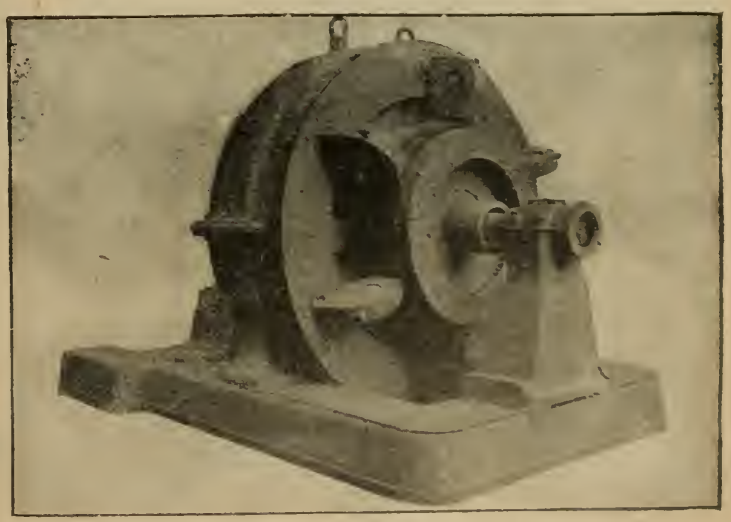

Fig. 3.—A 750 kW 1 500 V Compensated Generator.

The ratio between slip-ring and d.c. voltages on a rotary converter is practically fixed, and can be varied only within small limits, by variation of the field. The d.c. voltage can be controlled independently of the h.t. voltage by inserting reactance between h.t. line and slip rings. The author discusses, in the original Paper, the effect of different values of reactance, illustrating the problems by appropriate vector diagrams.

The author also discusses the origin and effect of these various ripples in detail, illustrating the problem by oscillographic diagrams. The oscillations on the d.c. side may also be broadly classified as

follows: (1) Tooth ripples. (2) Undulations with a frequency of 6 per period. (The oscillations of twelve times normal frequency are usually very small.)

The tooth ripple on rotary converters for traction purposes need not exceed ± per cent. of the d.c. voltage ripple. Providing the supply conforms to a sine wave, undulations of six times normal frequency need not exceed ± 2 per cent. of the mean d.c. voltage on full load, the deviation being slightly greater on overloads. In cases of interference noted the deviations have been considerably greater than the above, and it is not to be expected that any appreciable interference will occur on well-balanced telephone lines with ripples and undulations of this magnitude and frequency.

Wave-Shape of Primary Current.

The departure of the primary current from approximately a sine wave-shape is usually associated with extra loss in transmission or generation. In cases where the supply to converting apparatus is likely to form an appreciable percentage of the output of a generating station, the current wave-shape should approximate to a sine wave. Otherwise increased losses and heating may result in the generating equipment. Further, if the primary network contains overhead transmission, interference with communication circuits may result from the distortion of the current wave.

The wave-shape of the primary current on load and overload on modern equipments will be found to approximate closely to a sine wave.

Automatic Sub-Stations.

The introduction of the automatic substation considerably reduces the cost of attendance, but provision must be made for interest and depreciation on the extra control equipment required. This item increases with the number of equipments per substation, but this is not so with the cost of attendance. Hence the best field for automatic working is the single-unit substation.

In the past, however, on account of the cost of attendance, the tendency has been to group the converting apparatus, so that cases will arise in which automatic working will allow of a wider distribution of the converting plant, with resultant economy either in feeder copper or in copper losses, and consequent improvement in the distribution of voltage on the track.

Models of Ferromagnetic Induction.*

By Sir J. ALFRED EWING, K.C.B., F.R.S.

In giving a detail account of his more recent work in magnetism, the author developed the theory of magnetic induction put forward by him in 1890, and discussed the reasons which have led him to modify the theory in an important particular.

Weber's Conception

The theory was based on Weber's conception that a substance

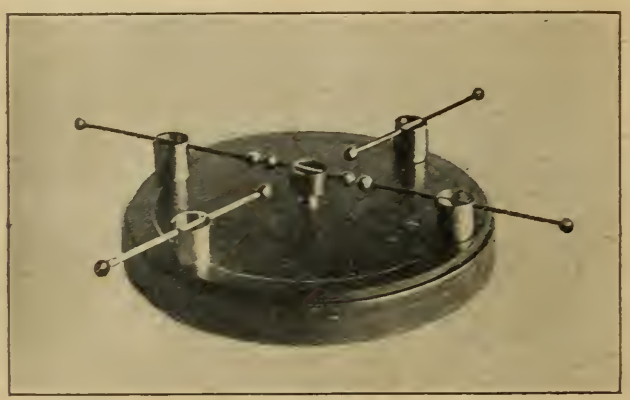

Fig. 1.—Model Showing Action in One Plane.

capable of strong magnetisation, such as iron, owes its magnetic quality to the presence within it of ultimate magnetic particles capable of being turned, and that the process of magnetising consists in compelling these particles to face more or less completely in one

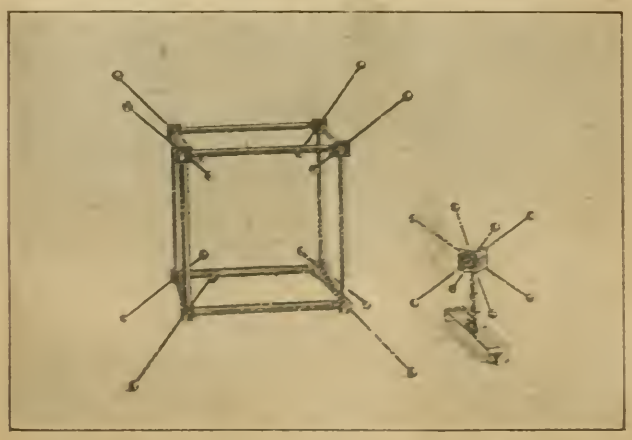

Fig. 2.—Model Showing Action in Three Dimensions.

direction. When all the Weber particles are facing one way, the iron is magnetically saturated. What the author showed in 1890 was that the control under which the Weber particles turned was a magnetic control, and that, in turning, they fell over from one position of stable equilibrium to another, through an unstable phase, thereby producing the phenomena of magnetic hysteresis.

This funadamental feature of the theory is retained, but the author has now abandoned his further idea that the control of the particles was due simply to their mutual magnetic forces acting from atom to atom, because a quantitative examination of the forces produced in that way has convinced him that other forces are also involved. These other forces are those which exist within each individual atom, between the Weber particle and the rest of the atom. We now know the atom to be a very complex whole, comprising many moving electrons. In a substance such as iron, each atom contains a Weber particle, a thing that turns under the influence of an external magnetising force. It is not the atom as a whole that turns, but only a part of it. According to the author's view, there is magnetic control exerted between the part that turns and an outer shell which is held fixed in relation to neighbouring atoms. He now shows that all the characteristics of the magne-

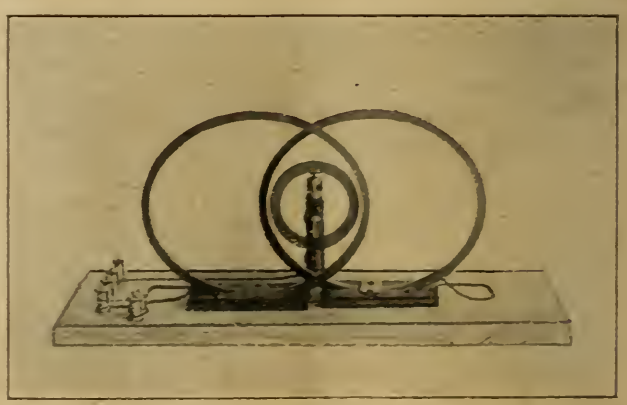

Fig 3.—Model of Rutherford-Bohr Conception.

tising process can be accounted for on this basis, and may be reproduced by means of illustrative models.

Equilibrium of Pivoted Magnets.

The first part of the Paper was a study of the equilibrium of pivoted magnets, undertaken with reference to the author's model of 1890, in which the Weber particles were represented as rows of little magnets controlling one another by their mutual forces only. It was shown that this model fails quantitatively because, when the magnets are placed near enough together to give the correct form to the curve of magnetisation in its several stages, the deflecting force which is required to break up the row is enormously greater than that which suffices to produce strong magnetisation in iron. The stability of the row is far too great. In the new model the stability can be reduced to any desired extent, for it depends on the balance of attracting and repelling forces due to the action of opposite portions of the outer shell of the atom on the Weber particle within.

* Abstract of a Paper read before the Royal Society of Edinburgh.

The New Models Described.

Several forms of the new model are described, some with pivoted magnets to represent the Weber particles, and fixed magnets to represent the controlling portions of the atomic shell. In the simplest model (Fig. 1), which shows the imaginary action in one plane, the Weber particle is a pivoted magnet in the middle of a group of four fixed magnets, all of which have their north poles facing inward. The pivoted magnet has four possible stable positions, pointing towards one or other of the fixed poles. The model of Fig. 2 represents the action in three dimensions. In it the Weber particle is a group of eight magnetic poles, turning as a whole within a group of eight fixed magnets. The arrangement is a cubically symmetrical one appropriate to a metal, such as iron, in the crystals of which the space lattice is known to be the centred cube.

The Rutherford-Bohr Conception.

In another model (Fig. 3) the Rutherford-Bohr conception of an atom with large electron orbits is realised. The orbits are represented by elliptically shaped coils, with the nucleus of the atom at their common focus: one of them is circular and turns under the control of the others, which are fixed. Sir Alfred Ewing went on to show that with these models it is possible to imitate known features in the magnetic behaviour of metals, including effects of stress and temperature. It was pointed out that the new model preserves all the advantages in this respect of his model of 1890, and at the same time escapes the quantitative discrepancy which had made it necessary to amend the former theory.

The Contractors' Coming-of-Age Dinner.

The coming-of-age dinner of the Electrical Contractors' Association, which was founded on Feb. 1, 1901, was held at the Hotel Cecil on Monday, under the presidency of Mr. J. Orringe.

Mr. J. MacGregor, in proposing the toast of the "Allied Associations and Honorary Officials," congratulated the Association on arriving at its majority. At twenty-one everything looked rosy, and there was no doubt that the future was bright for the Association. Such bodies were not trusts nor extortionists, but were formed with a desire to improve trade and to help people who had put money and brains into the industry to accumulate wealth and resist foreign competition. In the past jealousy had cut the trade to pieces, but they were now in a position to maintain the British electrical business and entirely to keep the foreigner out. The various associations in the trade must be brought closer together, and if this were done they might look forward to a brighter future.

The Duty of the Contractor.

The Chairman in reply gave an interesting historical account of the Electrical Contractors' Association, whose formation was due to a suggestion by Mr. Alabaster. He felt the Association was now making headway in the direction most likely to assist the development of the electrical industry. The importance of everyone belonging to a trade association must be stressed, and certainly every electrical contractor should belong to the Contractors' Association, which now had a membership of 750, representing the cream of the contractors in the country. Contractors were free canvassers for the supply side and were in a position to discover outlets from the manufacturers' products by the establishment of sales departments.

Wiring, Standardisation and Hiring.

In responding to the toast of the "Guests" proposed by Mr. T. E. Alger, Mr. C. H. Wordingham said that everything was to be gained by closer union between contractors and the Institution. Many of their body had done yeoman service on institution committees, especially in connection with the Wiring Rules. In formulating these rules he had often wondered what ground should be covered, for at present there was a tendency to write a treatise on wiring rather than to put forward regulations. In this matter they wanted a lead from contractors, and he hoped there would be ample opportunity for discussing the draft rules before they were confirmed. Another question on which he felt very strongly was standardisation. At present there was a multiplicity of patterns of accessories, which was a grave evil, as it increased costs. His experience on the B.E.S.A. had not been encouraging, and the work had been largely abortive because a standard fitting had not been taken up by the manufacturers. Closer work between electricity supply authorities and contractors was essential. In future supply engineers would have more time to devote to commercial development, and this should give very great results. More demonstration of apparatus was wanted in each town, and more should be done in the way of hiring out. He agreed that municipalities should not sell apparatus or wire buildings, but though the 1919 Act gave them power to hire, it gave them no power to sell. This was unjust to the consumer, as he could not hire-purchase. This defect might be overcome by allowing hire-purchase to be effected through the contractor.

Mr. Councillor E. C. Ransome, who also replied to the toast, said that associations such as theirs were for the good not only of the industries concerned, but for the public generally, as they meant standardisation and improved design and quality. In dealing with Government departments they were also useful, as representations from a body carried a vast deal more weight than those from individuals.

Correspondence.

THE INSTITUTION LIGHTING.

To the Editor of THE ELECTRICIAN.

Sir,—All members of our Institution are feeling very proud just now. Our fifty years' celebration with its most interesting features of our 10 000 membership roll and our Royal Charter, certainly entitle us to swell with pride, but, still, let us never be content whilst there are possibilities of improvement.

On this ground, I venture to express the opinion that it is regrettable, now we are again in possession of our Embankment house, that the illumination of the lecture hall is open to severe criticism. When the lighting was originally installed, under the advice of Messrs. Handcock Dykes, conditions were different, the half-watt (inert gasfilled) lamp had not arrived at a commercial stage and the Illuminating Engineering Society, founded by our greatly esteemed past president, Dr. Silvanus Thompson ("the Doctor"), was still unborn. The intense illumination of the white coves and the very dull appearance of the matt surfaced panelling make the hall unpleasant to be in after dark. The illumination of our building, seeing that so many of our members are professionally interested in electric lighting, should be a lesson in good electric illumination, both to members and to visitors. The illumination of the hall of the Society of Arts must be revised when that society rebuilds, as it shortly will, its famous home. The lecture hall of the Royal Institution possesses no dimmers. Let us hope the managers of neither society will come to our lecture hall for inspiration for improvement.

Funds are not lacking for improvement in illumination methods in our really fine home, and I suggest the immediate formation of a small committee of illumination experts, empowered to investigate and charged to make recommendations to our Council in sufficient time for the alterations to be made before next autumn.—I am, &c.

London, W. Justus Eck, M.I.E.E.
Feb. 25.

Beginning and Growth of the E.P.E.A.

At the meeting of the Informal Section of the Institution of Electrical Engineers, on Feb. 13, Mr. F. Pooley was in the chair when Mr. J. H. Parker opened a discussion on "The Evolution of a Staff Trade Union." Mr. Parker kept a large gathering keenly interested while he told at considerable length the story of the beginnings and the growth of the Electrical Power Engineers' Association. He declared this organisation was given impetus by the invidious situation of the engineering staff of the electric supply authorities at a time when the wages of the manual workers were being revised in view of the cost of living. He told of protracted negotiation with the councils and authorities over the wages schedule, and of temporising and evasion by these bodies, who in many cases have yet to honour their agreement.

He protested against misrepresentation of the aims and intentions of the E.P.E.A., which on occasions of acute public interest are often sensationally proclaimed by the lay Press. He declared that the policy of the E.P.E.A. is to secure the welfare of the whole industry, to avoid strikes, and, above all, the lightning strike, and he explained the past action of his organisation in declaring in advance of disputes which might involve their members, a readiness to support the side willing to arbitrate in that dispute. Bearing on this claim of moderation, he read one of the vital rules of the Association, which states that in case of any dispute calling for extreme action, 70 per cent. of the whole membership must agree to the proposed action, and he urged that this was ample safeguard against any impulsiveness.

East of Scotland Electricity District.

The Electricity Commissioners have provisionally determined that the undermentioned area shall be constituted a separate electricity district:—The county of the city of Edinburgh; the county of Midlothian; the county of East Lothian; so much of the county of Linlithgow as is included in the Royal burgh of South Queensferry; the parishes of Abercorn, Dalmeny, Ecclesmachan, Kirkliston (part of) and Uphall; and so much of the county of Peebles as is included in the parishes of Eddleston, Newlands and West Linton.

Objections on account of the inclusion of any area in, or the exclusion of any area from, the district provisionally determined should be addressed to the Secretary, Electricity Commission, Gwydyr House, Whitehall, London, S.W. 1, not later than July 31.

Two experimental houses have been built by Glasgow Corporation at their housing scheme district—Riddrie—where 1 000 dwellings are being erected. The two houses are all electric; there are no coal fires and no gas. The houses are two storey high, and consist of five apartments, with a large scullery. In cost of construction there is a saving of £80 per block, owing to the absence of chimneys and other adjuncts of coal fires and grates. Everything for lighting, heating and cooking is performed by electricity. There is an electric dish-washing boiler, and a clothes-washing machine operated by a motor is also provided, with a standard hot-water cylinder heated by electricity.

British Industries Fair, Birmingham.

The Birmingham section of the British Industries Fair was opened on Monday at Castle Bromwich Aerodrome Buildings, and it will be continued until Friday, March 10. It is, as previously, under the auspices of the Board of Trade, and is conducted by a council of Midland business men, representing the Birmingham Chamber of Commerce and the Birmingham City Council.

The Lord Mayor (Ald. David Davis) presided at luncheon on Monday, making allusion to the extraordinary diversity of Midland industries, which are largely represented in the Birmingham section of the Fair, and to the maintenance by manufacturers of a high quality standard (despite the temptation to accept other classes of business during the prolonged period of trade depression), and expressed the hope that the Fair would give a real impetus to overseas business.

Mr. H. O. Worrall, chairman of the council, who is associated with the leather industries, said there were many evidences in the Midlands that the rock bottom of trade depression had been reached and the upward swing of the pendulum commenced.

Development of Mass Production.

The exhibitors number 500, and there are 60 000 ft. of stands; the entries show a little falling off, but more of the larger firms are represented this year, and, by reason of an enlarged schedule, the Fair is particularly comprehensive. New groups provide for the inclusion of mining, colliery and quarrying machinery and appliances, and also equipment for the needs of agriculture, brewing and distilling. The agricultural group includes displays of agricultural, dairy and horticultural machinery and implements, and poultry equipment. The leading features are the groups devoted to general engineering and to brass foundry and hardware. Very representative, too, are the sections devoted to gas and electrical equipment and accessories.

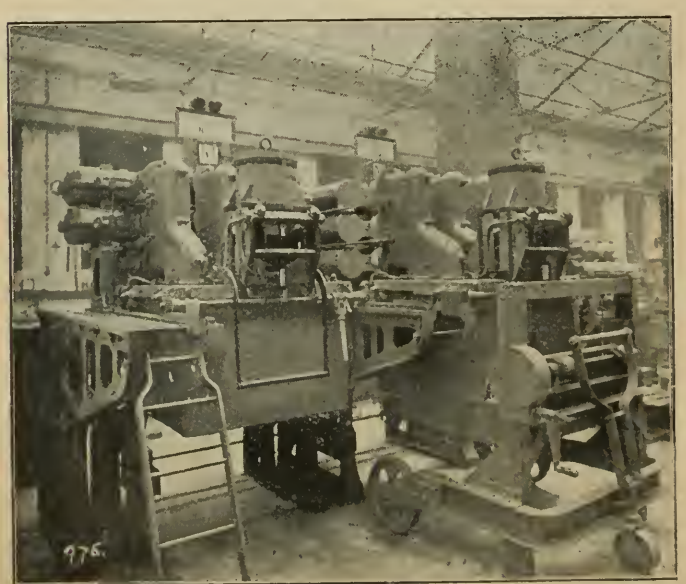
There is much evidence in the Fair of the development in manufacture of mass production methods (making for economy as well as for the standardisation of parts), of a general desire on the part of makers to produce precisely to overseas specifications, and of an increasing application of science to industry.

The Electrical Section.

The display of electrical equipment is unquestionably one of the largest and most interesting in the Fair. There are twenty-four stands devoted very largely to electric light and power fittings, thirteen to electric accessories, and a good deal of space is given to the display of electric fires and (domestic) electric fittings. Some attention, too, is directed to the industrial aspects of electricity, and we observe stands displaying electric arc welding plant, electric furnaces, dynamos, motors, elevators and control gear. Lighting sets and ships' fittings are also attractive features.

Up-to-Date Switchgear.

A. Reyrolle & Company, Ltd., Hebburn-on-Tyne, are exhibiting in Birmingham for the first time (Building B, Stand 201), and have a varied display of switchgear. This has attracted much interest among the general public, small power engineers, and electricity supply engineers, for the types of switchgear range from 5 A wall plugs to the large 20 000 V modern armour-clad high-tension switch-



Reyrolle's Ironclad Mining Switchgear.

gear. Particularly striking is a complete 20 000 V ("A J" type) electrically-driven switchgear, with remote panel control, the whole being in working order, and open to the closest inspection. There is much here to interest the mining engineer. Two excellent exhibits are the mining type of switchgear, which consists of Reyrolle's standard 3 000 V 400 A Class "E" mining pillar gear, and 600 V 200 A Class "F" gear. The illustration is of the former, and from this can quite easily be seen the substantial and sturdy construction, easy manipulation, complete isolation of the switch, and the immunity from any possible shock. This gear contains the common principles of all Reyrolle flame-proof mining gear and complies with the regulations of the Mining Act.

The motor engineer will be interested in the Reyrolle drum starter, while other apparatus shown include patent self-alignment fuses, quick break oil switches, and distribution and telephone dividing boxes. A varied selection of plugs and switches have the same characteristic careful attention to earthing and complete immunity from shocks. The switchgear may be described as water-proof, flame-proof, dust-proof, and vermin-proof, features which ensure complete safety.

Electric Lighting and Heating.

The display of electric lighting and heating equipments is very large, and is especially noteworthy on the decorative side. There are many beautiful designs, both in the metal fittings and also in the materials, be they minerals or textiles, used as shades. Chandeliers and candelabra are of infinite variety, and considerable novelty is to be observed. There are examples of fittings in various period styles, Jacobean in oxidised silver being among the most popular. For large buildings there is a wide choice for both exterior and interior lighting, and the indirect methods of illumination, while a large number of English alabaster bowls are on view. Some of the flambeau are remarkably effective, and are characterised by consummate artistry in design. A restraint in ornament, together with careful balancing and proportioning, form an important part in these charming lighting fittings. On the industrial side the display is of a very representative kind, but comparatively few new features are to be noted.

Domestic Electric Devices.

The Metropolitan-Vickers Company, Ltd., Manchester (Building B, 183 Stand), make a very extensive show of their "Cosmos" electric devices, and in this connection their Radiant fire and lamps are largely featured, as well as fans, for desks or brackets, with 12 in. and 16 in. blades. Flashlight, vacuum, and gasfilled lamps occupy a good deal of space. Other features on this stand are kettles of heavy gauge, spun sheet copper, polished, or with nickel-plated finish on copper, being in each case pure tinned inside. The heating elements consist of a nichrome resistance wound on mica, and are firmly secured to the bottom of the kettle. The "Cosmos" combined grill and toaster, useful for preparing quickly meals on the dining-room table or sideboard, attracts much attention; this appliance is supplied with a two-pin terminal standard connector.

Gent & Company, of Leicester (A Building, Stand 31), show a variety of electric clocks (for industrial and marine purposes), time discipline apparatus, and turrent clocks and chimes. Mining and shaft signals are good features, and in regard to the latter, the "Tangent" system (which is entirely electrical), it may be mentioned that no stepping mechanism is employed, that there is a relay for each signal with a single interrupter, and that the number and nature of the signal shows at the first stroke of the bell. Moreover, any error on the part of the signaller is at once apparent to the engineman, owing to the disagreement between visual and audible signals. The system is operated at the standard signalling pressure of 25 V.

Another exhibit of considerable industrial interest is an idle-machine recorder, on the "pulsynetic" system. The object is to give a record of the time during which a machine has been idle, and so assist the management in keeping the productive machinery fully occupied during working hours. On a machine becoming idle, even for half a minute, a mark is made on a record chart in a column against the number of the machine, and if the idleness is continued, a line is traced for the appropriate idle period. The recorder drum is electrically driven by a "pulsynetic" transmitter.

The London section which was opened on the same date is not of the same importance to electrical engineers as the Birmingham section, but there are attractive exhibits of scientific instruments, glassware, toys, clocks, &c.

(To be concluded.)

Ideal Home Exhibition.

At this exhibition, which is being held at Olympia, London, until the 25th inst., and which was opened by Princess Alice (Countess of Athlone) on Wednesday, there are, in addition to the exhibits connected with the building and furnishing trades, and the beautiful gardens in the Annexe, designed by the Queens of Holland, Spain, Belgium, Norway, and Roumania, Queen Alexandra, Princess Alice, Princess Mary, Lady Patricia Ramsay, and Lady May Cambridge, a large number of stands occupied by makers of electrical appliances, with which we shall deal in subsequent issues.

Frequent conferences upon housing, furnishing, gardening, fruit growing, poultry, &c., are being held during the period of the exhibition, and cinematograph exhibitions are being given daily.

The "Daily Mail" Model Village at Welwyn Garden City, Herts, will also be on view until March 25.

In the Exhibition Catalogue, the names are given of the winners of the "Daily Mail" Labour-Saving House Competition. The prizes are £300, £125, and £75.

Supervising Electricians.

The National Association of Supervising Electricians held their annual meeting on February 14 at the St. Bride's Institute, E.C. 4, when Mr. F. W. Smith, the chairman of the association, presided over a well-attended gathering.

The Chairman, in his address, complimented the members on the improved position of the association, and gave a brief *resumé* of the association's activities. The appointment of a full time general secretary had been fully justified. The finances of the association were sound, new members were continually being enlisted, and the general position was better than it had ever been. Enquiries were being received from all parts of the country, and the formation of district branches was well in hand. The necessity for the association in the electrical industry had been fully demonstrated, and the educational work had been of great benefit to those concerned. It was necessary that they should safeguard the interests of their members and see to it that the workers got an adequate return for their labour. The agreement with the National Federated Electrical Association was a step in the right direction, and prepared the way for greater advancement.

The ballot for the declared vacancies on the Board of Control resulted in the following being elected :—Messrs. F. J. Alldread, C. Burrows, J. F. Chapman, P. N. Hindell, J. Hudson, H. Manning, S. Nicholls, T. E. Pinder, F. W. Smith, A. Tucker, S. Smith, R. W. Whitley T. H. Windibank and C. G. Wright, and Messrs. H. Rooke and J. H. Hall were elected as members' auditors.

The affiliation to the National Federation of Professional, Technical, Administrative and Supervisory Workers is to be further developed. New rules, to cope with the increasing activities of the association, were adopted.

International Scientific Conference.

On the occasion of the seventy-fifth anniversary of its foundation, the Association des Ingénieurs Sortis de l'Ecole de Liége will organise an International Scientific Congress from June 11 to 16 next, to which the engineers and scientists of Belgium and the allied countries will be invited. There will be seven sections, viz., electricity, metallurgy, mining, mechanics, civil engineering, industrial chemistry and geology. In the domain of electricity the questions suggested for treatment and discussion comprise progress in the design of large turbo-alternators, organisation of large power stations and of hydro-electric works, the transmission of electrical energy at voltages over 100 000 V, material used for overhead transmission lines and overground sub-stations at pressures over 100 000 V, local distribution networks, protection of h.t. and e.h.t. lines, manufacture of e.h.t. underground cables, automatic sub-stations, mercury-vapour converters, improvement of power factor of networks, railway electrification (d.c., s. and three-phase, &c.), polyphase motors, electric propulsion of ships, the use of aluminium in electrical work, electricity tariffs, lamp manufacture, electric heating, automatic telephony, wireless telegraphy and telephony, &c.

Prize for Moving Platform.

The Municipal Council of Paris are offering prizes for the best design of mechanism for a moving platform for the conveyance of foot passengers. The suggestions must fit in with existing means of underground communication. The idea is to have a series of platforms moving parallel to one another, each one travelling faster than that next beside it. The first is to have such a speed that a passenger can easily step on to it from the ground or from a fixed platform, and the fastest is to have a speed of 15 kilometres (9½ miles) per hour. The increase of speed between adjacent platforms must not be too great to prevent passengers stepping from one to the other without shock. There are to be three prizes, of the value of 100 000, 50 000, and 30 000 francs respectively. If the authorities eventually decide to install one or other of the systems which receive prizes, then, even if no amicable understanding can be arrived at, the inventor will receive a further sum of 500 000 francs, which the Municipality covenants to pay as forfeit for adopting the design, lacking an agreement. Particulars may be obtained from the Direction des Travaux, 98 Quai de la Rapée, and technical conditions from the Service Technique due Metropolitain, 48, rue de Rivoli, Paris.

Mr. Henry Jackson has resigned his position with the London & North-Western Railway Company on reaching the age limit. Mr. Jackson was telegraph superintendent and electrical engineer for the Lancashire and Yorkshire Railway Company for a period of thirty-two and a half years, and was transferred to the North-Western Company on the amalgamation of the two companies.

Interesting letters have appeared in the "Times" during the week regarding the early experiments of David Hughes. In Saturday's issue Sir Joseph Larmor suggested, in the interests of scientific history, the publication of extracts from the notebooks of Hughes. On Monday a letter from Prof. J. A. Fleming appeared, pointing out that the evidence for which Sir Joseph asked (as to the early experiments of Hughes on electric radiation) already existed in the form of a letter written by David Hughes himself to The Electrician of May 5, 1899 (Vol. XLIII., p. 40).

The Late Mr. Thomas Clark.

We recently announced the death of Mr. Thomas Clark, who was chief electrician of the Telegraph Construction & Maintenance Company until his retirement in 1919. Mr. Clark, whose genial, kindly face was known to so many in all parts of the world, died at Worthing on Jan. 19 last at the age of seventy years, and the deep regret at his death which is felt by his colleagues in the company will no doubt be shared by many of the staff of the various cable companies in stations abroad. He entered the service of the Telegraph Construction Company in June, 1865, as a junior electrician, and served the company for fifty-four years, his first work being on the "Great Eastern" during the laying of the first successful

The Late Mr. Thomas Clark.

Atlantic cable. This was followed by a long course of sea work, in the testing-room, on cable laying and repairing expeditions in the Chiltern, Scanderia, Belgian, Edinburgh, Hawk, Hibernia, Minia. Wm. Cory, Kangaroo, Robert Lowe, Calabria, Seine, Scotia, Anglia, Colonia, and Teleonia.

During his career at sea Mr. Clark is computed to have travelled 660 000 miles, averaging over 14 000 miles a year for forty-seven years, and he was present at the laying of 108 000 miles of cable. He was appointed chief electrician of the Construction Company in 1891, and was in electrical charge of the testing during the laying of over 72 000 miles of submarine cable. His sea work finished in 1912, since when he remained as chief electrician at the company's Greenwich works until he retired in June, 1919. Our illustration is a reproduction of a recent portrait of Mr. Clark.

Power Developments in Nuremberg.

Nuremberg is a good example of how a town can render itself independent of transported fuel supplies, and can become an important industrial centre by means of hydro-electric power. Coal has still to be brought from Westphalia Silesia and Saxony, but about ten or twelve years ago a few leading industrialists and bankers combined with the Town Councils of Nuremberg and Fürth in order to establish two large hydro-electric stations. The capacity of the older station is about 30 000 kW, and there is a network of cables and distributors extending over nearly fifty miles. The station only supplies consumers of at least 60kW, the distribution to smaller customers being undertaken by subsidiary companies or municipal sub-stations. A larger central station was established in 1913, serving the whole of Middle and a large part of Lower Franconia, including nearly 700 towns and villages. Its cables extend over more than 900 square miles and supply electric motors aggregating close on 50 000 H.P. and well over 200 000 electric lamps. In consequence of the cheap and excellent electric service, the industrial growth of Nuremberg and the surrounding country has been rapid, and a number of new industries have been developed. In addition, it has greatly assisted in the increase of rural factories and domestic workshops.

The resignation of Mr. J. A. Robinson, the Salford electrical engineer, is announced. As a consultant he has a good deal of work in hand, and it is understood that this circumstance has influenced his resignation. He has, however, expressed willingness to help the Corporation as consulting engineer—an offer which is of special value in view of the erection of a super-station at Agecroft.

North-West Midlands Electricity District.

The inquiry into the scheme for the reorganisation of electricity supply in this district was commenced on the 21st ult. The chairman of the Electricity Commissioners (Sir John Snell) presided, and the other Commissioners present were Sir Henry Haward, Mr. H. Booth and Mr. W. Lackie.

Mr. Tyldesley Jones, K.C., on behalf of the Conference of Authorised Undertakers, who submitted the scheme, said that there was no opposition to the main principles involved. The conference consisted of the Corporations of Stoke-on-Trent, West Bromwich, Wolverhampton, Shrewsbury and Stafford, and the Midland Electricity Supply Corporation. In regard to the formation of a joint electricity authority, the view of the conference was that the authority should make an application to the Commissioners for the termination of the power companies in the area. However, he did not make the application, and he did not intend to put any evidence before the Commissioners bearing upon that issue, for it was not his duty to introduce anything at that stage which might prejudice them when the application was made. The Conference of Authorised Undertakers took the view that if the proposed joint authority was to be a success it ought to own and work generating stations. There was no power in the Act, however, enabling the authority to acquire compulsorily, and in the absence of compulsory powers acquisition could only be carried out by agreement. Besides the fact that there was no joint authority in existence with which an agreement could be made, there was the difficulty that in addition to the local authorities they had one company in the conference and one outside it, and there were differences as to the methods of financing the undertakings. The conference did not include Walsall Corporation, as it did not agree to the transfer of its generating station. There were fourteen generating stations in the area operated by ten authorised undertakers, and if those stations were to remain the property of the original owners the conference failed to see where the joint authority would come in. The view of his clients was that the joint authority should be representative of the authorised undertakers in the district. They did not want the Commissioners to constitute a body which would consist of representatives of people who had powers that they did not use and merely sat upon. The promoters did not propose to levy a deficiency rate, as they thought any deficiency should be carried forward. It was proposed to erect three new generating stations—at Rugeley, Stoke and Ironbridge respectively. It was suggested that the Rugeley should be the first to be erected, but it might subsequently prove that Ironbridge was the proper site to start with. It was, however, a question for the joint authority to settle. A difference of opinion on the subject had emerged between the conference of undertakers and Walsall Corporation, but he submitted that the question should be postponed for the discussion of the joint body.

The Chairman intimated that before the Commissioners gave their consent to the erection of any station they would require to be placed in possession of all the facts.

Constitution of the Joint Authority.

Walsall Corporation also objected to the proposed allocation of the voting power of undertakers on the joint authority, and they required that, having regard to geographical and other reasons, the area should be divided for the purposes of financial administration. It would be very inconvenient, however, if there were to be two financial autonomous divisional districts. Newcastle-under-Lyme objected principally to the taking over of the generating station and raised the question of compensation, but as there was no compulsory power to make them transfer their station unless the terms satisfied them, Newcastle need have no fear. Cannock would get representation, as they proposed to take their supply of energy from Wolverhampton Corporation. Tettenhall was one of a large body of local authorities who asked for representation, but counsel pointed out that if the Provisional Order sanctioning the extension of Wolverhampton municipal boundaries passed through Parliament, Tettenhall would cease to exist as an independent authority. The scheme, however, left such local authorities the right to buy the undertaking of the power company in their area, which now consisted of distribution mains only.

Promoter's Views.

Ald. Harry Leese, chairman of Stoke-on-Trent Electricity Committee, gave a history of the conferences which led up to the preparation of the scheme. It had been carefully considered and was unanimously adopted. The supply of current under the scheme could be commenced at once. As to representation on the joint authority, he thought that only the people who found the money should be represented. He agreed that if the scheme was a failure the consumer would have to pay.

The Chairman here intimated that he thought it reasonable that a clause under discussion should be extended so as to make it clear that it was competent for the Commissioners to impose an obligation to provide supply in the event of an authorised undertaker raising unreasonable objections to give such a supply.

On Wednesday Sir Harry Haward asked whether the Conference of Authorised Undertakers were absolutely wedded to the proposed constitution of the joint authority with regard to voting powers.

Ald. Leese said he did not think there would be any difficulty in ensuring that the smaller authorised undertakers should be given their proper weight on the authority. The feeling of the conference was very strong that the only people to be represented should be authorised undertakers. As to the terms on which the generating stations would be transferred, he did not believe there would be any serious prospect of disagreement.

Engineering Details.

Mr. John H. Rider, said he had acted as technical adviser to the engineering sub-committee appointed by the Conference of Authorised Undertakers. As a matter of commercial advisability, the whole of the single-phase alternating plant in the district would be shut down, and the two-phase plant now existing would continue for a period to which he could set no limit. He put in some financial statistics which gave the average cost per unit generated (exclusive of management charges) as 0·96d. The figures varied from 3·647d. at Shrewsbury to 0·743d. at Wolverhampton, the latter being the lowest. The total cost for the whole of the proposed district, including distribution, street lighting, management and capital charges, would be 1·552d. The chances were strongly in favour of a continued increasing demand for electrical energy. The total load connected to the six principal generating stations in the district in 1921 was 104 228 kW, which he estimated would increase to 250 000 kW in 1925. To meet that increased demand adequately he thought three new generating stations would be required, and the first one, which should be ready by 1926, should be erected at Rugeley.

Mr. R. Harker (for Walsall Corporation) said that the authority he represented considered that no new generating station would be necessary for some time, and that the growing demand could be met by the extension of the existing Corporation mains.

The Chairman remarked that the Commissioners had considered the matter, and had decided that in the interests of the district they ought to hear the counter-proposals of Walsall Corporation.

Mr. Rider, continuing his evidence, said that Rugeley was the most suitable site for the first power station in the district. It was midway between the northern and southern parts of the district, and as it was necessary to have a river for the cheap generating of electrical power, they would be practically tied to that side of the River Trent. It was proposed that the Rugeley station should be worked at the highest possible load factor, relying upon the plant at the local stations as a stand-by. There was less chance of expansion in the southern than in the northern part of the district. The proposed generating station at Rugeley was intended to provide the greater part of the supply for the south-eastern district, and Stafford and Stoke would obtain their supply from that station.

In cross-examination by Mr. Harker (for Walsall), witness declined to agree that the extension of the Birchills generating station would be as advantageous as Rugeley, as there was only a limited supply of condensing water and the facilities for coal delivery were not so good. If those difficulties could be overcome, Birchills would have the most appropriate site for generating.

Replying to Mr. Tyler (for the railway companies), Mr. Rider said he regarded the inclusion of a representative of the railways upon the joint authority as undesirable. It was better that the joint authority should be in a position to deal with the railway companies as outside bodies.

The Shropshire Power Company.

Mr. Tyldesley Jones, K.C. (for the promoters), said that in his opening statement he said that so far as the Shropshire, Worcestershire & Staffordshire Electric Power Company was concerned, they were sterilised until August, 1923, and that they were therefore not entitled to be represented on the joint authority. It now appeared that the company were providing certain supplies in the southern part of the district, and that constituted the Shropshire company an authorised undertaker, and as such they were entitled to representation. That did not, however, alter the view of the Conference of Authorised Undertakers that an application should be made to the Commissioners in due course for the termination of the rights of the power company in that area.

In answer to Sir Harry Haward, witness expressed the opinion that if the local authorities owning the various generating stations would agree without reservation to put the whole operation of the stations, the system of management and the administration of the staffs in the hands of the joint authority, the actual ownership of the stations would not be desired.

Mr. C. Meades, chairman of Stafford Electricity Committee, said they could install at Stafford 2 000 additional h.p., but that was the maximum, and it was, therefore, obvious that Stafford would need some help. He thought the purpose could best be served by the district being constituted as a whole for electricity supply rather than by the area being divided into two, as proposed by Walsall. There would be a great development in the near future in the district between Stoke-on-Trent and Lichfield.

Mr. Arthur Collins said he estimated that if the proposed scheme came into operation the joint authority would be able to supply the increased quantity of energy required at a cost much less than would be possible under present conditions. The saving in cost to the consumer ought not to be less than £120 000 a year.

Railway Companies' Position.

Mr. Tyler (for the L. & N.W., G.W., Midland, and North Staffordshire Railway Companies) said he was unable to give details as to the likelihood of electrification upon those lines in the near future, but goods and passenger traffic was dense, and electrification would no doubt sooner or later present itself for consideration. In the case of the Potteries Railway the subject was gone into in 1910, but the project was not proceeded with on account of cost. It would, however, be again considered when the railway grouping scheme was completed. The total consumption of electrical energy by the companies amounted to 700 000 units per year, the whole of it for power, nearly the whole being used by the North Staffordshire Railway. If a cheaper supply were available, the demand for current for power, as distinct from traction, would increase

enormously. The railway companies approached the question of electricity supply purely from the commercial aspect; they were out to get their current at the cheapest price. The companies desired, however, to advance certain views on two questions of principle. The first was the obligation upon the joint authority to give a supply, and the second the right of the companies to representation upon that body. There was no precedent for the precise form of constitution proposed for the joint authority, but the companies regarded it as important that there should be somebody on it representative of the consumer. The railways' demand for electricity would be one of the greatest in the district and it would be in the interests of the joint authority that it should be kept aware of developments in that direction by representatives of the railways.

On Friday the case for the promoters closed, and counsel for Newcastle pointed out that the Corporation was not concerned in the question of coal deliveries, as their generating plant was oil driven.

Colliery Requirements.

Mr. H. H. Joy (for Cannock Chase Coalowners' Association) directed the Commissioners' attention to the probability that in the near future electricity would be applied to winding and ventilating of the collieries, and the coalowners felt strongly that when that time came they ought to be satisfied that they had the amplest possible safeguard against the failure of the supply.

Mr. Frank Anslow said he had advised the Cannock Chase Coalowners' Association that, in principle, the scheme was one which should be adopted. The area included fourteen colliery firms or companies owning thirty-five pits, with an output of about 5 000 000 tons of coal per annum. Practically all the collieries were equipped with some electrical plant. Some of the privately owned generating plants had reached such proportions that they should have consideration in the final settlement of the scheme. The demand to meet the present and immediate future requirements of the districts he estimated to be from 10 000 to 11 000 kW. The annual consumption would in the immediate future be from 30 000 000 to 40 000 000 units per annum. Electric winding and ventilation was a matter of development which, in other coalfields, had been shown to follow the provision of a cheap and abundant supply of electric power. It might be assumed, therefore, that with this provision there would be an additional demand of at least 5 000 kW. There would be a net saving in coal of at least 200 000 tons per annum.

The extensions at Birchills would include the erection of two boiler-houses and other buildings, together with the provision of a railway siding. The existing station depended for condensing water upon the canal, and if the extensions were carried out it would mean the admission into the canal of a much larger volume of hot water than at present. The station was designed for an output of 12 000 kW, but the extension would increase it to 20 000 kW. It would not be possible to obtain water at a sufficiently low temperature from the canal for condensing purposes if the extensions were carried out, and it was proposed to erect cooling towers. The total current generated at Birchills when extended would be 109½ million units, and the quantity of water pumped would be 1 200 000 gallons per day.

Mr. H. A. Howie, borough electrical engineer of Walsall, replying to the chairman, said that during last year it was necessary to shut off part of the load at Birchills owing to the temperature of the condensing water becoming too high, and the tramways had to be temporarily stopped. The canal was several inches lower than normal at the time, and a considerable quantity of mud was drawn into the condensers.

On Saturday Mr. E. M. Lacey gave evidence on behalf of Walsall Corporation, and said he believed there was a sufficient supply of water for condensation purposes at the Birchills station. The collieries would be better assured of security of supply under the proposals put forward by Walsall than by those of the conference of authorised undertakers. The linking up of the Walsall generating station with that at Wolverhampton would be a much cheaper and more adequate undertaking than the erection of a new station at Rugeley.

On Tuesday evidence was given by Mr. Lacey as to the capital expenditure involved in the extension of Birchills station and other matters.

Mr. Rider was recalled, and expressed the opinion that Mr. Lacey's estimates were inadequate. Referring to turbo-generators mentioned in Mr. Lacey's evidence as having been quoted for by a foreign firm at £3.7 per kW, he said reliable machinery could not be obtained at such a price in this country. Comparing the proposed new station at Rugeley with the Birchills extension scheme, he said that on the same load factor the cost of coal per unit would be less at Rugeley than at Birchills because at the former they had cold river water for condensing instead of recirculated canal water as at Birchills.

Counsel having addressed the Commissioners, Sir Harry Haward said they were much gratified at the public spirit shown by the authorised undertakers in preparing the scheme and presenting it with so much precision. It was a happy augury for a cheap supply of electricity in the area. The Commissioners would give most careful consideration to the scheme and to the counter-proposals of Walsall Corporation.

Owing to the necessity for reduction in public expenditure, the Department of Overseas Trade announce that as from April 1 the following Imperial Trade correspondents will be recalled :—Brisbane, Dunedin (N.Z.), East London, Durban and Bloemfontein.

E

Improved Street Lighting in Oxford-street.

The Borough of St. Marylebone has always been associated with good street lighting, and Oxford-street in particular has for many years enjoyed the reputation of being one of the best illuminated streets in the metropolis. Whenever new developments in lamp manufacture or illuminating engineering have occurred, Marylebone has taken the fullest advantage of them.

Early in January of this year the lighting in Oxford-street was reconsidered with a view to bringing the installation up to the standard demanded by modern traffic conditions. After careful consideration and experiment, it was decided to replace the existing

Fig. 1.

500 W units by 250 V 1 500 W Osram gasfilled lamps, supplied by the General Electric Company, Ltd., and mounted in new lanterns of octagonal form fitted with diffusing glass panels, designed by Mr. Haydn T. Harrison. This combination yields an illumination remarkable for its uniformity and freedom from glare, as will be seen from the photograph reproduced in Fig. 1.

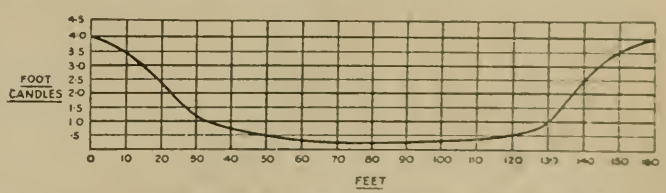


Fig. 2.—Curve showing the Distribution between two Adjacent Standards.

The lanterns are mounted at a height of 25 ft. above street level and at an average distance apart of 160 ft. The average intensity of illumination is 2·1 ft. candles, the maximum value under the lamp being 4·0 ft. candles, and the minimum value between posts being 0·2 ft. candles. Fig. 2 is an illumination curve showing the intensity of light on an horizontal plane 3 ft. above the road surface between two posts.

Social Notes.

The first meeting of the Golf Circle of the Engineers' Club will be held, by the courtesy of the Sandy Lodge Golf Club Committee, at Sandy Lodge on Wednesday March 8. There will be a medal round in the morning and a bogey round after lunch. Lunch will be provided at the clubhouse. The green fee is 6s. for the day, lunch and caddies extra.

About 1 200 persons were present at the Queen's Hall, Langham-place, London, W., on Friday, on the occasion of the nineteenth (the first since 1915) annual smoking concert of the staff of Babcock & Wilcox. A long and enjoyable programme was given. Mr. C. S. Davy (manager of the London office) presided, and among those present were Sir John Dewrance, K.B.E. (chairman of the company) and Sir James Kennal (managing director).

The fourteenth annual dinner of the technical and administrative staff of Cardiff Electricity and Tramways Departments was held last Friday. Councillor S. Jenkins (chairman of the electricity and tramways committee) presided, and was supported by Messrs. C. G. Morley New (city electrical engineer), R. L. Horsfield (city tramways general manager), H. J. David (traffic superintendent), A. Ellis (late engineer and manager of the combined departments), H. Ellis (late chief of Southampton tramways), J. E. Teasdel, W. J. Radley and J. Preston. Councillor Jenkins, in proposing the "City of Cardiff Electricity and Tramways Departments," said the past year had been one of stress, and they had suffered considerably from labour troubles, but they were hoping that there were better things in store this year. Messrs. Morley New and R. L. Horsfield responded. Other toasts followed, after which an excellent musical programme was rendered.

Legal Intelligence.

Electric Furnace Dispute.

Mr. Justice Sankey has been occupied for some days in hearing an action arising out of the sale of an electric steel furnace by the plaintiffs, Electro-Metals, Ltd., to the defendants, the Malleable Steel Castings Company (1909), Ltd., for £3 300. The purchase money was to be paid in three instalments, and plaintiffs now sought to recover one of these sums (£1 100) and a further sum of £139, representing materials supplied in connection with the furnace. Defendants counter-claimed to recover various amounts.

Plaintiffs' case was that they had supplied a number of these furnaces to various Government departments and other concerns, and that they had met with considerable success. The contract for the furnace in question, of 30 cwt. capacity, was made in May, 1918, following interviews between Mr W. Bibby, who at the time was joint managing director of plaintiff company, and Mr. Edward Y. Walsh, managing director of defendant company. An undertaking was given that the furnace would be capable of producing steel to the defendants' satisfaction. The furnace was installed about the middle of 1919, and the first trial run was made on July 29. There were a number of minor mishaps consequent upon broken electrodes and such matters, but they were in course of time rectified. The trials were made under the supervision of the plaintiffs' engineer, Mr. H. Needham, and heats were continued under his direction down to November, 1919, when it was impossible to go on owing to the moulders' strike. Plaintiffs claimed that they had performed the contract and were entitled to the balance of the price. It was also said that defendants' workmen, having been accustomed hitherto only to iron casting, did not possess the necessary experience and skill for steel casting.

Defendants said the furnace never worked to their satisfaction. Plaintiffs had not completed their contract, and the furnace could not be run commercially. Mr. Walsh said he told Mr. Bibby he wanted steel of 40 tons tensile strength to the square inch, with 15 per cent. elongation, and Mr. Bibby said it could be got, and the furnace was the latest thing in steel production. Instead of a current consumption of 800 units to the ton of metal, which defendants had been told would be the figure, the furnace consumed twice that amount. Plaintiffs replied that no guarantee of the tensile strength was ever given, and they denied that defendants' figures regarding electricity consumed were accurate.

In the counterclaim defendants sought to recover in respect of wages paid in working the furnace, metal alleged to have been spoilt, electricity consumed, and the cost that would be entailed in putting the furnace in order.

The hearing was adjourned until a date to be fixed.

Hamilton v. Marconi's Wireless Telegraph Company.

This action was in the list for hearing on Friday last by the Lord Chief Justice and a special jury, but Mr. Douglas Hogg, K.C. (appearing with Mr. Bevan for the Marconi Company) took a preliminary objection, and asked his Lordship to look at the pleadings, from which he would find that plaintiff could not open his case without committing a contempt of court in view of an undertaking which he had given in former Chancery proceedings, that a certain agreement between him and the company should not be published. Counsel quoted authorities in support of his action.

Mr. Hamilton, who appeared in person, contended that the undertaking was obtained by misrepresentation, and that he did not fully understand its purport when he gave it.

The Lord Chief Justice pointed out that he could not get over the fact that the undertaking had been given, and before the case could proceed plaintiff would have to go to the Chancery Division to get the undertaking set aside.

After some argument the case was stayed, with costs against plaintiff.

Personal and Appointments.

Mr. C. G. Lamb has been appointed Reader in Electrical Engineering at Cambridge University.

Mr. W. Burrows, of the British Insulated & Helsby Cable Company, was presented last week with a case of cutlery subscribed for by the office staff, on the occasion of his marriage.

Mr. Frank Wright has been appointed chief electrical engineer to Matthews & Yates, Ltd., in succession to Mr. Wm. Inglis, who now represents Laurence Scott & Company, Ltd., in the Lancashire area.

Mr. James Makin, chief electrical engineer of Bexley, and engineer and general manager of Bexley Council Tramways and Dartford Light Railway Joint Undertaking, has been appointed chief electrical engineer of the City of Hereford.

Following the resignation of Mr. J. W. Hame as electricity engineer and tramways manager, York Electricity Committee have decided to appoint a whole-time engineer for the electricity department, and a whole-time manager (preferably an engineer) for the tramways undertaking. They recommend the appiontment of Mr. E. J. Nichols as City Electrical Engineer, at £650 a year, and that a tramways manager be appointed at £600 a year.

Mr. Ronald Grierson, for twelve and a half years chief electrical and mechanical engineer to Provincial Cinematograph Theatres, Ltd., and its associated companies, has resigned his appointment in order to take an active interest in a new contracting firm, details of which will be available shortly. In the meantime manufacturers of cables, conduit motors, switchgear, fittings, &c., desiring to get into touch with Mr. Grierson, should address correspondence, care of 197, Wardour-street, London, W. 1. 'Phone, Regent 2 226.

Parliamentary Intelligence.

Engineering Trade Dispute.

In a written reply to Commander Bellairs (House of Commons, Feb. 27), Dr. Macnamara said there had been two recent ballots of the members of the Amalgamated Engineering Union in connection with matters that were under discussion in the present dispute. The first was taken on a provisional agreement relating to overtime and nightshift conditions in September, 1920, and resulted in a majority of 43 151 for the agreement. At that time the total membership of the Amalgamated Engineering Union was about 460 000, inclusive of members on superannuation benefit and members of branches overseas. The result of a second ballot, which was taken on the provisional agreement of Nov. 17 and 18, 1921, interpreting the agreement of September, 1920, was a majority of 14 715 against acceptance. The present membership of the union was approximately 409 000. His information did not enable him to state exactly what percentage the majority in each case constituted of the membership of the union eligible to vote, as certain classes, such as members abroad, did not take part in the ballot.

The Proposed Barking Station

In reply to Capt. Martin (House of Commons, Feb. 27), Mr. Neal stated that it was not possible to say when the County of London Electric Supply Company would commence the construction of their generating station at Barking. The Company's Act of 1921 empowered the Electricity Commissioners, when giving their consent to the construction of the station, to prescribe the terms on which the undertaking might be acquired by the proposed joint electricity authority for Greater London. With the object of facilitating the commencement of the work, the Commissioners had communicated the terms to the company, and it was anticipated that formal sanction to proceed with the work would be given shortly.

Private Bills.

Blackburn Corporation Bill passed its first reading in the House of Commons on Friday.

A number of petitioners have lodged petitions against the Black Country Tramways & Light Railways Bill. The majority of these are by local authorities, who object to the proposed lengthening of the concession and to the increase of fares.

Petitions have been lodged by the Caerphilly and Abersychan Urban and Llantrisant Rural Councils, and the Aberdare and Aberaman Consumers' Gas Company and other gas companies in South Wales against the Bill of the South Wales Electrical Power Distribution Company.

Railway Electrification.

The Industrial Group of the House of Commons have appointed a deputation consisting of Sir Allan Smith, Sir William Pearce, Sir Philip Dawson and Mr. P. J. Hannon, to wait upon the Parliamentary Secretary to the Ministry of Transport and invite his assistance in suggesting such amendments in the Railways Act as will enable the London, Brighton and South Coast Railway Co. to proceed with its scheme of electrification without delay.

Select Committee on Telephones.

This committee decided at their meeting last week to call no more evidence. They adjourned for a fortnight, when they will again meet to consider their draft report.

Institution Notes.

A Paper on "High-speed Wireless Telegraphy" was read before the Chelmsford Engineering Society on Feb. 16 by Mr. C. H. Ford, who fully explained the Wheatstone automatic telegraph plant as used to work the wireless sets sending messages at high speed. Mr. Ford then dealt with the more obsolete spark sets as they were used to send high-speed wireless messages, and the signalling keys which interrupted the power supply at 12 000 V. The present type of wireless plant was then explained, in which valve transmitting and receiving stations with directional aerials are used.

At the annual dinner on Friday of the Birmingham Electric Club, Mr. Gilbert C. Vyle (Messrs. Avery's) referred to the difficulties of the industrial position, and stated that the cost of production, which rested at the door of labour, and nowhere else, affected the situation seriously. Mr. H. K. Beale, chairman of Birmingham Electric Supply Committee, stated that in 1895 half a million units of electricity were generated as compared with 137 millions last year. By the time the committee had developed all their schemes, Birmingham would, he thought, be the largest generating authority in the country. Developments were about to take place on the eastern side of the city. With a bigger output it might be possible to reduce charges.

The annual dinner of the North-Western Centre of the Institution of Electrical Engineers will be held at Manchester on Friday, March 24, in the large banqueting hall of the Midland Hotel at 7 p.m. for 7.15 p.m. The President has signified his intention of being present. It is intended to have a short toast list to allow time for a musical programme, and to give members an opportunity to meet one another. Tickets (price 12s. 6d., exclusive of wine) may be obtained from the following Manchester members:—Messrs. W. Walker (chairman), 20, Mount-street; A. S. Barnard (vice-chairman), Monsall Lodge, Prestwich; A. G. Livesay, Lloyd's Bank Buildings, King-street; S. L. Pearce, Corporation Electricity Works, Dickinson-street; C. D. Taite, Lancashire Electric Power Company, 196, Deansgate; A. G. Ellis (hon. secretary), Metropolitan-Vickers Electrical Company, Ltd., Trafford Park; A. L. Green (assistant secretary), 8, Westminster-avenue, Whalley Range, Manchester.

Electricity Supply.

BENTLEY and DONCASTER Councils have agreed to erect on the Victoria-road housing site twenty-four standards, each fitted with electric lamps of 100 c.p. each, at a cost of £9 per lamp per annum.

The deputation recently sent by GLASGOW Corporation to visit British and Continental refuse destructor works have issued a report in which they recommend delay in the erection of plant until the results are known of the experiments which are being made in refuse disposal in Berlin. At Rotterdam the deputation state that the destructor works are capable of dealing with 450 tons of refuse a day, and the whole of the electric current required for operating the tramways is produced by steam generated from the burning of the town's refuse.

Recently several contracts for the supply of ELECTRICITY METERS have been let to CONTINENTAL FIRMS by companies and by municipal electricity supply undertakings. Among those who have placed orders abroad are the Watford and Leeds Electricity Committees. At Leeds considerable feeling has been aroused, but a labour member of the Electricity Committee who was challenged on the question alleges that "there is a ring in this country which is demanding 45s. 6d. per meter, whereas in Germany meters can be bought for 23s. 1d. carriage paid, in Switzerland for 27s. 4d., and in France for 32s. 6d."

Ald. Walker, speaking at Stretford on Monday on the work of the MANCHESTER Electricity Department, said the principal thing in an electricity station was not coal, but water. He gave particulars of how Manchester Corporation had become involved in somewhat costly litigation as a result of using water from the canal at Stuart-street works, which, when turned back again, had become much warmer, so warm, in fact, that the pitch in the canal barges melted and caused damage to the boats. In order to obviate the trouble they had to have recourse to the cooling tower. At Barton they would use the canal also, but not the cooling tower.

A public meeting, attended by nearly 2 000 ratepayers of Wimbledon, was held at the Baths Hall on Monday evening, to discuss the action of the Town Council in summarily dismissing Mr. H. TOMLINSON LEE, chief borough electrical engineer. Alderman H. W. Simpson presided. On the motion of ex-Councillor R. D. Pond, seconded by Mr. A. Webb, a resolution was carried, with only a few dissentients, protesting against the action of the Electricity Committee and the Borough Council in dismissing the electrical engineer without any statement of their reason, and demanding a public inquiry before any further action was taken. It was decided that copies of the resolution should be sent to the Mayor of Wimbledon, the Minister of Health and the Minister of Labour, and the Electrical Power Engineers' Association.

In the report of the special sub-committee on the present condition of the HULL electricity undertaking (referred to in our last issue) it is stated that the main defects of the generating plant are, according to the engineer, Major Bell :—(*a*) Want of economisers to new water-tube boilers; (*b*) mechanical stokers to same not being efficient; (*c*) inadequate shafts or chimneys. He recommended the installation of economisers with future boilers, the employment of a special combustion engineer, and an alteration of the mechanical stokers as soon as possible. The committee also found that plans prepared by Major Bell were not adhered to by Mr. Magoris, who acted in Major Bell's absence. Major Bell and Mr. Magoris differ on the question of suitability of such plans, and these as well as other matters will be referred to a consulting engineer.

New Schemes and Mains Extensions.

PORT TALBOT Town Council have decided to proceed with an application for a Special Order to supply electricity for light, heat and power.

TEIGNMOUTH Electric Lighting Company have received more than the amount required to go to allotment, and are taking steps to proceed with the work of laying the mains.

WATERFORD Public Lighting Committee have recommended the appointment of Mr. Sean McEntee to draw up a report on the proposed electric lighting scheme for the city.

EALING Electricity Committee are considering the possibility of removing the transformer sub-station at the corner of Station-approach, Ealing Broadway, and have instructed Mr. Knight, the borough electrical engineer, to make inquiries regarding a new site.

NAVAN (Ireland) Urban Council have decided to erect electricity works at a cost of £9 970. The water power of the River Boyne will be employed. Electricity for light will be supplied at 9d. a unit and for power at 3d. It is estimated that the income will be £3 415 a year. The Council is to apply for a loan of £12 000.

At last Thursday's meeting of PRESTON Town Council it was stated that the Government had offered to pay 50 per cent. of the interest on money spent on contracts completed up to a certain date at the new generating station. The Electricity Committee considered it was a generous offer, and the Council have accepted it.

BIRMINGHAM Electricity Committee have approved a scheme for extending the supply cables to the outside areas on the east and south side of the city, at a cost of about £100 000. The proposal is to run a h.t. main through Ward End, Stechford, Yardley, Acock's Green, Hall Green, Alcester Lanes End, King's Norton, Cotteridge, Northfield and Selly Oak, to Weoley Park. Pressure will be reduced at transformer stations for local consumption. Good progress is being made with the Nechells power station.

Electric Traction.

For the nine months ending Dec. 31, 1921, HALIFAX Corporation Tramways show a profit of £1 136.

BIRMINGHAM Tramways Committee have extended the hours of the tram and 'bus services from 11 p.m. to 11.30 p.m.

The Ministry of Transport have granted a Provisional Order to DONCASTER Corporation for a loop tramway line above Trafford-street and Factory-lane.

Mr. A. J. Smith, C.A., Glasgow, who was appointed arbiter by the Sheriff in a DISPUTE BETWEEN GREENOCK CORPORATION AND THE TRAMWAYS COMPANY, regarding the rates for electricity, has issued his award, which is favourable to the Corporation. The latter maintained that the company should make a payment of £9 000. The company had paid £5 000, and the award is to the effect that the company's payment shall be over £8 000.

NEWCASTLE tramway men came out on strike on Saturday evening against the proposal to institute a 48-hour week instead of the present 44 hours. At the moment of going to press there seems to be little likelihood of an early resumption of work. The men have rejected an offer by the Tramways Sub-Committee along the lines of increased pay for the additional four hours and "other advantages and improvements in conditions of working." Although the depots have been open for any of the men to resume work on the Committee's condition of a 48-hour week at the old rates, not a single man has presented himself, and the pickets at the various depots have had nothing to do.

The Highways Committee of the LONDON COUNTY COUNCIL have entered into a three-years' agreement under which the company shall continue to operate the lines transferred to the Council in Hammersmith, the Council running one service from Hammersmith to the County boundary and thence along the company's lines to Kew Bridge, or such other point on the company's system as may be agreed. The Council will operate the whole of the service on the company's lines between the County boundary at Merton and Wimbledon, each party retaining the receipts from its own cars. An estimate of capital expenditure (£1 550) for the connection of the tramway tracks of the company with those of the Council, the extension of the overhead wires and standards, and the installation of a change point at Merton terminus has been approved.

Wireless Notes.

The Vazdai Press Agency at Amsterdam began its WIRELESS TELEPHONE NEWS SERVICE for the Dutch Press last week.

The UNITED STATES Senate has passed a resolution, already adopted by the House of Representatives, extending the privileges of the naval wireless service to the Press for five years.

A 500 kW RADIO STATION is being erected at Ruysselede, near Bruges, by the Société Independante Belge de Télégraphie Sans Fils. It will be able to communicate with North and South America and the Congo, and four simultaneous messages can be received. Another big radio station is to be constructed by the Government at Elisabethville, in the Congo.

Business Items, &c.

We are glad to learn that the LORIVAL MANUFACTURING COMPANY (1921), LTD., has secured a substantial contract from the Admiralty for the supply of submarine accumulator containers. Hitherto the supply of these articles has been, more or less, a foreign monopoly.

REAVELL & COMPANY announce that owing to the growth of their business they have moved their London office to larger premises at 47, Victoria-street. Their telephone number, "Victoria 5 935," remains as before. The head office of the business is still at Ranelagh Works, Ipswich.

On Saturday, Feb. 18, a party of members of the Association of Engineers in Charge visited the BENJAMIN ELECTRIC, LTD.'s, works at Tottenham, where the company's manufactures and methods were explained. The party numbered over thirty, and, in addition to an explanatory tour of the works, a short lantern lecture was given on "Industrial Illumination."

Obituary.

We regret to learn that Mr. DRUITT HALPIN, M.I.C.E., M.I.Mech.E., died on Feb. 27, after a long illness. Mr Halpin was a consulting engineer, an authority on boiler-house equipment and refuse destruction, and was for some years managing director of Halpin's Patent Thermal Storage, Ltd.

The death is announced of PROF. J. FISCHER-HINNEN, the well-known Swiss electrical engineer and author of several works and papers on dynamos and motors. Born in Zurich in 1869, he soon developed a liking for physical science and electrical engineering studies. At the age of 19 he joined the staff of the Maschinenfabrik Oerlikon, and, with two short intervals, during which he visited Spain and the Chicago Exhibition, he remained with the company until 1895, being engaged on electric generator and motor design, and on electric railway work. He succeeded the late Prof. E. Arnold as chief designer of the company, but later he spent five years in Paris and three in Prague. In 1905 he returned to the Oerlikon Company as head of their small motor department. In 1914 he became professor of electrotechnics at the Cantonal Institute at Winterthur and director of the Electrotechnical Institute.

Imperial Notes.

Collingwood (Victoria) Council are considering the adoption of electric driving at their colliery instead of steam. The first cost of the change will be nearly £1 000.

Scottsdale (Tasmania) Council are carrying out a water and electric supply scheme. The reservoir has been constructed, and approved by the Minister of Public Works.

The programme of the Parliament of the Union of South Africa includes measures relating to railway construction, weights and measures, the consolidation of company laws, and the production of electricity.

Owing to the cheap supply of power provided by the Southern Canada Power Company, seventeen new industries have been established in the eastern part of Quebec during the past three years with an invested capital of $10 000 000.

A manufacturers' agent in Montreal desires to obtain, on a commission basis, the representation of United Kingdom manufacturers of electrical specialities and shelf hardware of all kinds for Eastern Canada. Particulars from the Department of Overseas Trade. (Reference No. 203.)

Seventy-three miles of the Melbourne Suburban Railways had been converted to electric traction by the middle of January. In addition to these, the Oakleigh and Glen Huntly to Melbourne sections were expected to be opened by about the present time. Up to date about £4 000 000 has been expended on the electrification.

A report is being prepared on a proposal to adopt electric traction on the lines of the Temiskaming & Northern Ontario Railway Commission. The main line is about 252 miles in length, and runs from North Bay to Cochrane. In connection with the scheme an investigation is being made of water-power resources of Northern Ontario.

Bathurst (N.S.W.) Council have received a communication from the Premier of New South Wales to the effect that the question of proceeding with the construction of the power-house to supply electrical energy to railway stations and towns west of Blue Mountains is being carefully considered by the Railway Commissioners, and the site for the power-station has been decided upon.

The site of the Victorian Electricity Commissioners' new power station at Newport (Victoria) has been prepared, and the first turbo-generator is expected by June next. The site of the Morwell power-house is almost ready. This month a start will be made to remove the overburden at Morwell preparatory to producing coal, which should be practicable about the middle of the present year.

By Imperial Preference Order (No. 1), of 1922, the following territories are now included within the definition of the British Empire for the purposes of Sec. 8 of the Finance Act, 1919:—(*a*) The South-West Africa Territory (formerly German South-West Africa); (*b*) the territory of New Guinea (the former German possessions in the Pacific Ocean situated south of the Equator other than German Samoa and Nauru); and (*c*) the territory of Western Samoa (formerly German Samoa).

Owing to a sympathetic strike of the electricity works staff at Johannesburg, in support of the miners, there was no electricity supply on Monday, except at a few places of amusement possessing their own plants. The Strike Committee decided that the Council must not use "scab" coal, and the result is that industries dependent upon the municipal power station are at a standstill and no tramcars are running. The Government will run the lighting services by means of volunteers.

A hydro-electric scheme was prepared four years ago by an engineer of the Ceylon Public Works Department, and "Indian Engineering" understands that such a scheme is likely to be carried out in the near future. The Government is acquiring the Hardenhuish Valley forty miles from Colombo, for the intake reservoir. The Government has favoured the proposal for the generation of electrical energy from the Aberdeen-Laxapanagalla scheme which will combine the flow of two streams into the Hardenhuish Valley, and permit of the generation of 200 000 e.h.p.

European Reconstruction.

As the result of last week's London Conference of the Organising Committee of the Central International Corporation and National Corporations, steps are to be taken to re-establish national corporations in various countries affiliated together (with a central International Corporation in London), for the purpose of assisting, financially and otherwise, the work of European reconstruction. The capital of the National Corporations will be the equivalent of £20 000 000, of which 25 per cent. is to be immediately called up. Government guarantees will be requested where necessary to enable the capital to be raised. The initial capital of the Central International Corporation (£2 000 000) will be provided by subscriptions by the National Corporations of approximately 10 per cent. of their original capital. The following countries have been invited to subscribe 20 per cent. of the total £20 000 000 proposed to be raised, viz., Great Britain, France, Germany, Italy, and Belgium. It is also proposed to ask the United States, Japan, Denmark, Holland, Switzerland, and Czecho-Slovakia to participate, and the Central International Corporation will have power to allow other countries to come in if they so desire.

Foreign Notes.

About 13 000 electricians and metal workers have gone on strike at Mayence.

In order to facilitate the transport of workers in the new mining region of Limbourg, Belgium, a number of light electric railways and tramways are being constructed.

Efforts are being made to improve the Paris tramway system, and the Surface Transport Company is to build 600 new electric tramcars, 300 trailers and 300 motor-omnibuses.

It is officially announced that the Illinois Central Railroad Company will create $50 000 000 7 per cent. preferred stock, which will be convertible with common stock, and the proceeds devoted to electrifying the Chicago lines and the reconstruction of the terminals there.

A decree has been issued by M. Le Trocquer that after Jan. 1 next no gas lighting will be permitted on express trains. After Jan. 1, 1924, electricity must be used for lighting on suburban trains, and by 1925 all trains operating in France must be lighted by electricity.

The supply of electricity in Athens is given by the Société Anonyme Hellénique du Gaz d'Athènes et Autres Villes, a French company. The consumers' voltage is 110 d.c., and only metal filament lamps are used for public lighting. The price of electricity is 20 lepta per unit.

In consequence of the general increase in prices of raw materials and advances in wages and salaries, the Union of Manufacturers of Electric Heating and Cooking Apparatus, of Charlottenburg, Berlin, has authorised substantial increases in the prices of electric irons, cookers, etc.

The manufacture of incandescent electric lamps is now one of the most important industries of Holland, and during the first seven months of 1921 the value of the export of lamps was about £1 000 000. The exports were mainly to France, Great Britain, Spain, Argentina, Belgium, Italy and Sweden.

According to recent reports, there has been a drop in the internal demand for electric cables and wires, motors, meters, and installation material in Germany, but the activity in large steam and hydro-electric plants and for telegraph and telephone apparatus continues unabated. There has been a decreased demand for incandescent lamps for export.

According to the Christiania Press, it is proposed to commence immediately preliminary work on the two electric railways, for which concessions have been granted to A/S "Akersbanerne." The Ostensjo line, which is to cover a distance of 5·2 km., is calculated to cost 720 000kr. per km., while the estimated cost of the Sognsvand line is 700 000kr. per km.

Tenders are being invited for the supply of electric cables in connection with the scheme for the electrification of the Swiss Federal Railways, and foreign tenders will be considered on the present occasion. The scheme will involve the ultimate electrification of a network of 3 000 miles, and the adoption of electric traction on branch lines is also being considered.

According to the Automobile Bureau of the New York Edison Company, the total number of electric passenger automobiles in use in America in 1920 was 16 641. Of these, 4 500 (or 27 per cent. of the total) were in Chicago, and 2 500 (15 per cent.) in Cleveland. The demand for this type of vehicle is said to be on the increase, and the output is soon expected to reach the record of 1918, which was 7 000 cars. Recent reductions in prices have brought the level close to that of 1910.

Bitter comment is made in the "Electrical World" on the paralysis of the United States Patent Office, with the result that patent applications are held up for a year or more. In 1918 the total number of applications was 57 000, but in 1921 it was 109 238. In the same period the examining staff was increased by only 5 per cent., because technical men could not be found to accept the salary scale offered. The result is that there are now arrears of 60 000 applications, and the situation is not likely to improve without legislation. The House of Representatives has passed a relief Bill, but the Senate is holding it up.

The total value of the electrical exports from the United States in December, 1921, was $5 177 276, an increase of nearly $1 000 000 over the preceding month, the total for the year 1921 being nearly $96 000 000, a decrease of over $6 000 000 in value. Prices showed an average drop of 7½ per cent. compared with 1920, but the volume increased slightly. There were substantial increases in the export of dynamos and generators, motors, transformers, insulated wire and cables, carbon filament lamps, meters, and telegraph and telephone apparatus. There was, however, a marked decrease in batteries, carbons, wiring supplies, and in heating and cooking apparatus.

The Société des Agriculteurs de l'Oise are organising an important electrical exhibition, which will be held in June next at Compiègne. The use of electricity is extending rapidly in the north and east of France, not only for lighting, but for industrial power and agricultural purposes. Several co-operative societies have sprung up for the distribution of electrical energy, and in the Oise alone there are six of these in full operaton, and two more are about to be formed. It is anticipated that in a few years quite two-thirds of the communes of the Department will enjoy the advantage of a good supply of electricity. The last date for entering is Feb. 25, and particulars can be obtained from the Commissaire-Général (M. Lefèvre), 7, rue du Palais de Justice, Beauvais.

Companies' Meetings, Reports, &c.

London Electric Supply Corporation.

Mr. R. H. Benson (chairman) presided at the annual meeting of the London Electric Supply Corporation last week.

Referring to the report and accounts (*see* Electrician, Feb. 17), the Chairman said that the company's net revenue increase during 1921 was from £99 487 to £102 286. After putting aside the sinking fund of £16 580 per annum to extinguish their debenure stock, fixed charges, and £20 000 more for reserve and contingencies, the directors recommended 4 per cent. dividend on the ordinary capital, against 2½ per cent. last year, leaving to be carried forward £14 080, against £14 256 brought in. The past year was the year of the coal strike—high cost of fuel, high wages, and higher rates and taxes. When complaint was made that private enterprise blocked the way to cheap power the public should remember, among other factors, the increase of rates—£48 400 in their case in 1921, compared with £11 845 in 1914. If they had stood at the 1914 figure the ordinary shareholder could have received 12 per cent. The increase in rates took 66 per cent. of the return they should have received. Should not local authorities expend their utmost energies in trying to give ratepayers some relief before attempting to take on their shoulders the provision of electricity at the risk of still further increasing the rates? They had received a very gratifying letter from the general manager of the London, Brighton and South Coast Railway testifying to the value of the company's supply during the strike, which enabled the railway to continue its electrical service unrestricted.

Why was it that the vital industry of electrical supply had been treated like a football, continually kicked about and never getting through the goal-posts? He (the chairman) did not suppose Parliament intended to keep the companies, its creatures, poor so that the municipalities might buy them up cheaply in 1931, owing to their credit gradually becoming impaired as that date approached. But that was the way it worked. The company's capital account was overdrawn by £244 089. They needed the money for more plant to meet the annual increase of demand and to cheapen the supply. But until the Parliamentary uncertainty was removed they could not get it. What was needed was an immediate settlement of the London County Council's option of purchase in 1931 and an extension of tenure long enough to make it possible to borrow at a reasonable rate of interest, and repay by a moderate sinking fund spread over so many years as would not penalise present consumers.

From 1888 to 1903 the shareholders' money went in pioneering experiments, by which the public benefited. The first dividend, which was 3 per cent. was in 1904; and the total dividends up to date (including 1921) amounted to 44½ per cent., or an average of 1·3 per cent. per annum. Could anyone say that the shareholders had had too large a share of the price paid by the consumer for light and power? Out of every pound paid to-day by the consumer, labour now received 12s. 3¾d., against 8s. 10d. in 1914; rates and taxes 3s. 5¾d., against 1s. 9d.; and the shareholders 1s. 5¼., against 3s 10½d. in 1914. Obviously costs of production were too high. Cheap power depended on increased output and increased consumption. Between 1903 and 1915 at least fourteen private electrical Bills were deposited in Parliament. Very few passed. The cost of promoting and opposing them must have been at least between £200 000 and £300 000. What was there to show for it? The technical improvements recommended in the Act of 1919, especially bulk supply, were the same as those proposed by companies nearly twenty years ago, and they might have been carried out by this time, and much more cheaply than now. They would have kept the industry well ahead of the demand for power, instead of, as it now was, behindhand.

St. James's and Pall Mall Electric Light.

Presiding at the annual meeting of the St. James's & Pall Mall Electric Light Company, Ltd., on Tuesday, Mr. Walter Leaf (chairman) said the report showed a very profitable year, and the tide of prosperity for the company was on the flow. The last half of 1921 was distinctly better for them than the first, and the figures of the first two months of 1922 continued and emphasised this improvement. The rebuilding of Regent-street promised to their company a large increase in business in the near future; they seemed to be as far as ever from "saturation point." With all the uncertainty and difficulty caused by the coal strike, they did not feel justified in making any reduction of price during the year, but they expected to be in a position shortly to announce concessions in lighting power tariff. The increased capital expenditure under the head of machinery arose from the continued process of conversion of Carnaby-street from a generating to a transforming station. That was now approaching completion, and it would not be long before they would take the whole of their current from Grove-road.

A large scheme of reconstruction and extension to the Central Company had been carried out during the year. The new repair workshop had been completed and fully equipped with machine tools. The main structure of the new boiler house was nearing completion. An additional large cooling tower for 7 500 kW had been completed in time for this winter's load. The first of the two 10 000 kW turbo-generators, to which he referred a year ago, was finished and put to work in the summer, and was running at full output during the last quarter of the year, enabling both the parent companies to close down their old steam plant. The erection of the second 10 000 kW set was completed by the end of the year. The first two B. & W. 50 000 lb. boilers, the delay in the erection of which caused them serious anxiety, were completed in time to enable them to make full use of the first large turbine. The second pair was also considerably delayed, so that they were not in time for the winter load, but they were also approaching completion.

The output from the Grove-road works amounted to 39 857 000 units, an increase of 1 611 000 units, due almost entirely to the extra supply given to the Horseferry-road station of the Westminster Company during the coal strike. The maximum load increased by 6 000 kW to 22 500 kW, covering the whole requirements of the two parent companies, except the Horseferry area. The plant had been run with an improved economy during the year; the gain on the new turbine, which was running only for the last quarter, was estimated at a saving of 2 900 tons of coal, or about £6 000. This they hoped to improve upon very much during the current year, when both turbines would be running. The station was, in fact, now the most efficient of any public supply in the south of England. An agreement had been made with the Chelsea Company for a largely increased supply direct from Grove-road, and it was expected that the supply would be available within the next six months. The cost of the extension made it necessary to seek fresh capital, and in April last an issue was made of £500 000 8 per cent. five-year notes. A claim had been made on them for corporation profits tax. This they were disputing, and they had made no provision for it. In common with other companies, they were taking steps to represent to the Government the injustice of this particular form of taxation. An abstract of accounts appeared in our issue of Feb. 17.

South Metropolitan Electric Light and Power.

The annual meeting of the South Metropolitan Electric Light and Power Company was held on Tuesday, Mr. H. St John Winkworth (the chairman) presiding.

The chairman, in moving the adoption of the report and accounts, said the net revenue amounted to £100 315, against £50 509 in 1916 and £2 150 in 1901. The total horse-power connected at the end of the year was 32 387, against 30,726 in 1920. Compared with 1920, the new services numbered 436, against 539; lamp connections (in 35W equivalents) 44 319, against 56 553; the total consumers and h.p. connected at December 31, 1921, were 8 489 and 32 387 respectively. The number of units sold was 18 697 606 (17 643 122), and the average price obtained from all classes of supply was 2·65d. per unit (2·55d.). The units sold to the larger works and factories were, generally speaking, less than last year owing to the depression in industry. Receipts from sales of current (less rebates) amounted to £206 690 (£186 775). Rentals of meters and apparatus on hire were a little up. Sundry receipts, contract work, &c., were £2 500 down, which was accounted for by a smaller turnover in the showroom and wiring department. The gross receipts from all sources were £216 808, against £199 037 in 1920. There was a decrease of £12 400 net sum. Oil, waste and water, salaries of engineers, wages in generation and distribution were all higher. The expenditure on repairs was £3 660 more, and the plant was now all in good and efficient working order. Rates showed a considerable increase (£4 430). Management expenses were £9 491, against £7 844, the addition being due to the increased business, except in the case of general establishment charges, where the increase was entirely caused by higher postal charges. The total amount of the expenditure was £116 493, compared with £116 216 for the previous year, representing a ratio of cost to gross receipts of 54 per cent., compared with 58 per cent. The amount carried to net revenue account was £100 315 (£82 821), which, with £18 260 brought in and £1 000, the dividend on the company's holding in the West Kent Electric Company, made a total of £119 576 (£96 146). It was proposed to place £24 000 to depreciation (£23 000), £25 000 to reserve (£10,000), pay a 10 per cent. dividend on the ordinary shares (against 8 per cent.), and carry forward £21 497 (£18 260). The capital expenditure for the year, after crediting £500 to electrical instruments, tools and loose plant, and £1 000 to installations account, was £37 882.

Mather & Platt, Ltd.

Mr. L. E. Mather (chairman), addressing the shareholders at the annual meeting of Mather & Platt, Ltd., on Monday, said that the results of 1921 had proved considerably better than any previous year, and that they were able not only to recommend paying the same dividend as last year, but to increase the carry forward by a large amount. This satisfactory state of affairs, in spite of the present depression, was due, in the first place, to a large increase in the volume of turnover, and, secondly, to the profit on the large amount of work in progress brought in from the previous year. No profit on work in progress was taken to the credit of 1920, and it consequently increased the profits of 1921. The percentage of profit on turnover in 1921 actually was slightly less than in the previous year. The increased turnover was made possible by the firm's new extensions with their increased tool capacity, which were completed in time to augment the output considerably. Thus they were able to make deliveries before selling prices had fallen or their stocks had depreciated to any serious extent. Although the profit was much larger than in the previous year, the directors considered that the present time did not justify a larger dividend, and therefore considered it prudent to recommend the same dividend and to increase the carry forward in view of the uncertainties of the future. The capital account of the company was increased by £156 000, due to the payment of the final call, on March 1, 1921, on the new shares issued at par in 1920. The fixed assets at £918 000 showed an increase of £106 000, due to the completion of the extensions at Park Works. War loan and investments in preferred stocks were increased by £10 000 to bring them up to market value at the end of the year. The item stock in trade, which included the work in progress, showed a reduction of £375 000, which showed that they

were not carrying forward to the current year as large a volume of work in hand as they did a year ago, and the value was also reduced by the lower prices now ruling. Sundry debtors, at £535 000, showed a reduction of £200 000, notwithstanding the increased turnover. The bank overdraft of last year had been changed to a considerable balance on the assets side. The item of sundry creditors had been reduced by £250 000.

After paying a tribute to the memory of the late Dr. Edward Hopkinson, the chairman said that last year he was able to report that the company had more men employed in their shops than ever before. The result of this was shown in the results of the year, but for the last few months their company, too, had been feeling the trade depression. Their output per man was decidedly increased over that of the preceding year, and although that was to some extent due to the more settled condition of labour, he considered that the system of payment by results which they adopted wherever possible had contributed also to that result.

The Works Continuation School continued to prove its value. All boys attended the school for eight hours a week from the time they entered the works up to their eighteenth birthday, and he was glad to say that even when suspended for lack of work in the shops they continued to attend school voluntarily. The Research Laboratory, which had now been in existence nearly two years, had justified the expense incurred, and had enabled them to improve the standard of their products and to keep up to date in all departments.

He did not intend to discuss the threatened engineering lock-out, except to say that they regretted it should have been necessary, and earnestly hoped that agreement might still be possible on a principle that all employers considered vital. As regards future prospects at home and abroad, they were obtaining their share of such home contracts as were being placed, but they were not extensive. In France, where they had now established their own French company for sales purposes, business was affected adversely by the rate of exchange, causing their former customers to await improvement, or sometimes even to accept the tempting offers of German firms. Russia was still a closed book, and would remain so until the Government there adopted a sound policy which would attract traders and provide something to exchange other than useless paper. In India they had made good progress. They had also work in their shops from other important countries, such as Italy, Egypt, China, Japan, Brazil, Scandinavia and Canada.

Central London Railway.

Presiding at the annual meeting of the Central London Railway Company last week, Lord Ashfield said that the year 1921 was the first year during which the extension railway from Shepherd's Bush to Ealing had been continuously worked. Under agreement, the G.W.R. Company maintained the railway and stations, and the Central London worked the train service. For working the train service the company received a share of the traffic receipts attributable to the extension railway. This share, however, had barely been sufficient to meet the expenses incurred during the year. The results of working the extension were very disappointing. It was impossible to give exact figures, but the number of passengers using the extension during 1921 was estimated at only 3 200 000, against 9 000 000 passengers using the Ealing group of stations upon the Metropolitan District Railway and travelling to and from the central and western areas of London. This was due to the higher fares charged for journeys on the route, which was necessitated by the fact that the railway from Shepherd's Bush to Ealing Broadway was part of the Great Western Railway, upon which the fares were based upon the pre-war rate of fare increased by 75 per cent. Their company were in negotiation with the Great Western for an adjustment of the fares situation which would enable them to treat all routes from Ealing Broadway into central London alike.

Expectations raised by the revision of fares in Sept., 1920, had not been realised. Experience had shown the general correctness of the level of fares then introduced, but the financial results had fallen somewhat short by reason of the acute depression of trade and industry, which, commencing with the coal strike of last year, still continued. There had been a small additional expenditure during the year, mainly for the completion of the connection with the Ealing Extension. Progress was being continued with the transfer of the power supply from the generating station at Wood-lane to the Lot's-road power house, and further expenditure amounting to £11 900 was contemplated in this connection. The last steam locomotive belonging to the company had been removed from the active list. The number of cars available for passenger service had been reduced by four, and two electric locomotives had also been transferred from the active list to service vehicles. An attempt had been made to deal with the maintenance work, which got into arrear during the war period, and a full programme was now in operation. There had been an increase in train mileage, due to the working for a complete year of the Ealing and Shepherd's Bush extension. There had been a decline in passengers from 50 millions to 43½ millions, or 13 per cent.

The receipts from railway working after the operation of the Common Fund were £661 479, an increase of £83 096 on 1920; expenditure amounted to £468 428 (£16 704), leaving net receipts of £193 051 (£99 800). Miscellaneous receipts amounted to £68 071 (£5 247), making a total net income of £261 122 (£94 553). Adding balance from last year (£15 161) and deducting interest, rentals and other fixed charges (£46 039), appropriation to reserve (£29 000), dividend on preference stock (£21 600), the balance available for dividends on ordinary, preferred and deferred ordinary stocks was £179 644, against £96 984. The interim dividends of 2 per cent. on the ordinary and preferred ordinary stock in August last absorbed £46 925, leaving £132 719 available, out of which the directors proposed to pay final dividends of 2 per cent. on the ordinary stock and of 2 per cent. on the preferred ordinary stock for the year, together with a dividend of 4 per cent. on the deferred ordinary stock for the whole year, making in the case of the ordinary stock and the preferred ordinary stock 4 per cent. for the year, and leaving to be carried forward £59 644. The sum of £29 000 had been placed to reserve, an increase over the previous year of £9 000. The dividends for 1920 were 2¼ per cent. on the ordinary stock, 4 per cent. on the preferred ordinary, and ½ per cent. on the deferred ordinary stock, with £15 161 carried forward.

Metropolitan Railway.

The annual meeting of the Metropolitan Railway Company was held last week, Lord Aberconway presiding.

The Chairman, in moving the adoption of the report and accounts, said the net receipts from railway working were £509 076, against £451 495 in 1920. The interest on the debenture stock and the full dividends on the several preference stocks amounted to the same figure as last year, and after providing for these and transferring £50 000 to the general renewals fund, as they did last year, they had a balance available for dividend on the ordinary stock of £185 202, against £127 020. Out of this balance the board recommended the payment of a dividend on the ordinary stock for the year at the rate of 2¼ per cent. per annum carrying forward the surplus of £17 796. As they paid an interim dividend of 1¼ per cent. per annum for the half-year ended June, this would mean a further payment at the rate of 3¼ per cent. per annum in respect of the second half of the year. They had now over £550 000 set aside for reserve and renewal purposes without taking into account the £206 440 which the Government had recently paid as the first instalment of the amount due in satisfaction of outstanding claims arising out of their control. They had spent during the year just over £400,000 on capital account. Having regard to the way in which land was being developed down the line, and to the prospects they had of a large goods and passenger traffic to and from Wembley Park commencing with next year, and a large passenger traffic to and from the projected exhibition and sports ground, their foresight in adding to their rolling stock and locomotive and power plant had been more than justified. They looked for a still further reduction in their journey times as they got delivery of the new higher-powered electric locomotives. The company's wages bill in 1913 was £295 926; in 1921 it was £924 578, an increase of over 200 per cent. In 1913 their coal cost them £65 000; last year it cost them £223 000. The latter figure was abnormal on account of the strike and its consequences. The number of passengers originating on the line in 1921, apart from season ticket holders, was fewer by about 20 000 000 than in 1920. Compared with 1913, the last normal year when they were working on their own account, the number of passengers originating on the line in 1921 showed an increase of some 10 000 000, and their season ticket traffic had practically doubled itself. So far as fares were concerned, while the increases made did not at present recoup them for the increased working expenses, they thought that they were on a correct economic basis.

The Wembley Park Estate Company had recently sold about 120 acres of their land at Wembley to the authorities of the British Empire Exhibition with a view to that exhibition being held there in 1924. The company would undoubtedly reap very considerable benefit from the exhibition traffic and, as it was the intention to make Wembley the future centre for many of the annual trade and other exhibitions held in London, and also to establish there a sports centre, it was likely to be a source of additional revenue to the company for a long time to come. As a company they were in an infinitely stronger position financially than they had ever been before, and their revenue-earning capacity was greater than it had been hitherto.

The report and accounts were adopted, and the following resolution was passed :—" That this meeting, while willing to bear income tax in common with other H.M. subjects, objects to the payment of an additional income tax or super-tax upon that part of their incomes derived from the profits of railways, or other public utility companies, whose charges are fixed or regulated by statute, and calls upon the Chancellor of the Exchequer and the Government to exempt for all time the companies mentioned in Sec. 52 (2), paragraphs (i.) and (ii.), of the Finance Act, 1920, from corporation profits tax."

S.E. and Chatham Railways.

The annual meeting of the South-Eastern and London, Chatham and Dover Railway Companies was held last Thursday, under the presidency of Mr. H. C. O. Bonsor (the chairman).

The Chairman said that on Aug. 16 last the Government gave them back their railways, after seven years of State control. To put it in the mildest possible form, the damage done to the company as a commercial undertaking was serious. The compensation allotted to the company was £1 031 000. They had had to draw £382 000 of that to make up the revenue of 1920. There was a further sum of something over £1 000 000 to come when the accounts were made up next year. Large economies had taken place all over their system. Wages were lower, both coal and materials were cheaper. The managing committee was ordered under the Railways Act to be a constituent company. It had no shareholders, no capital, and yet it was ordered to be a party to the fusion of the Southern group. The Act was "a most extraordinary production." For the first time in Parliamentary history, he said, commercial businesses were ordered to amalgamate whether they liked it or whether they did not.

Regarding the electrification proposals, Mr. Bonsor said that when

the Working Union Act was passed the principal asset of the Chatham Company was their short distance metropolitan traffic. That asset no longer existed; competition by tram and omnibus had killed it, and their revenue was derived from the area outside the metropolis. That revenue was now threatened by an extension of road competition, and before the war broke out they were preparing plans for the electrification of their system within a twenty-mile radius of London. The war postponed any scheme of that description, and at the end of the war Government control had so diminished railway credit that it was impossible to raise the capital for that most necessary undertaking. The Trades Facilities Act passed last session gave the company the opportunity of asking for the financial assistance of the Government. They were able to show that with seven London central stations they had a splendid position for distributing their passengers in the business areas of London; that besides finding immediate employment for a large number, they would be benefiting the public and increasing development in the counties of Surrey and Kent. Their proposals met with favourable consideration, and their explanation that it was impossible to ask the shareholders under present circumstances to consent to a direct obligation by the issue of capital was also accepted by the Government Committee.

In order to comply with the requirements of the Act it would be necessary that a "private" construction limited company should be formed; its capital would be small, sufficient to cover preliminary expenses; it would not trade for profit; and it would have borrowing powers sufficient to cover the cost of construction. The money borrowed would carry the Government guarantee, both as to principal and interest, and be obtained on the most favourable terms as the work progresses. The works would be the property of the Construction Company, and when complete would be let to the managing committee on lease for twenty-five years at a rent sufficient to repay capital and interest at the expiration of the lease when the works would become the property of the managing committee or its successors. They were satisfied that the electrification would be a considerable and valuable asset to their railways. An agreement with the Government would be necessary, and would be submitted to the shareholders at special meetings to be convened for that purpose.

London Electric Railway Company.

At the annual meeting of the London Electric Railway Company last Thursday, Lord Ashfield (the chairman) said that the year 1921 marked the turning point in expenditure. The reductions in wages obtained during the year were equivalent to a saving of about £240 000 a year for the four railways. And with the reductions still in prospect the total saving in expenditure on this account in 1922 would be about £400 000. Many economies had been inaugurated. A committee of officers had been sitting from week to week reviewing in detail the whole of the company's organisation and methods. A new experimental train with air-worked doors had been put on the Piccadilly section of the company. Alterations to rolling stock were being carried out to provide ten trains of this type, which increased the speed of operation by the additional and wider doors and reduced the number of men required per train. At Kilburn Park station a new type of booking office had been installed, which enabled the sale and check of tickets to be carried out at one point instead of two as previously. The experiment was to be extended to several other stations almost immediately. In the coming year there should be appreciable savings in the cost of materials. The average price paid during 1921 for coal (including the oil used experimentally) worked out at about 52s. 6d. per ton. For the current year to date the cost was less than 32s. 6d. per ton, with a definite promise of a still lower price. The ratio of working expenses to receipts on the railways during 1921 was 70 per cent. There was a lively hope of this being reduced to a more normal proportion, though they could not expect to reach the 50 per cent. of 1913. The company received as its share of the common fund £320 552, against £106 348 in 1920. The debenture capital had been increased by £200 000. The net expenditure on capital account during last year amounted to £66 121. The receipts from railway working, after operation of the common fund, amounted to £2 040 000, an increase of £223 000. Working expenses were £1 369 000, or £19 000 less than in 1920, leaving net receipts of £671 000. The miscellaneous receipts were approximately the same as last year and the total net income was £808 000 an increase of £243 000. The balance brought forward from last year's account (£22 000) made the sum to be dealt with £830 000 approximately. Interest, rentals, and other fixed charges amounted to £296 000 very little more than in 1920. £65 000 was set aside for renewals as against £45 000. The dividend on the preference stock was £127 000, the same as last year. When all these deductions were made there was a balance available for dividend on the ordinary shares of £343 000, an increase of £216 000. An interim dividend of 1½ per cent. had been paid upon the ordinary shares in respect of the first half of the year, and it was now proposed that a further dividend of 1¾ per cent. should be paid, making 3¼ per cent. for the year. This left £40 000 to be carried forward, compared with £22 000 brought in.

Lanarkshire Tramways Company.

At the annual meeting of the Lanarkshire Tramways Company Mr. A. R. Monks (chairman of the company), who presided, stated that the traffic receipts for the year amounted to £226 260, against £228 272 in the previous year. It was anticipated in the early months of the year that there would be a very material increase, but the coal strike and general trade depression which followed had caused their receipts for several months past to be lower than at the corresponding period last year. There was also a small decrease in the sundry revenue, which made a net decrease in the gross revenue for the year of £2 096. They were, however, able to effect substantial reductions in operating expenses, which, at £182 510 for the year, showed a reduction of £9 457 on 1920. There was a reduction of £248 in the cost of electricity, and but for the coal stoppage costs would have been very much lower. Repairs and traffic showed a reduction of £13 883, due, firstly, to the fact that their repairs were not so extensive as in 1920; secondly, to the fall in the cost of materials; and thirdly, to reductions in wages to the staff owing to the continued fall in cost of living. General expenses were £4 770 in excess of the previous year, local rates showed an increase of £700, accidents and other insurances an increase of £3 800, and Insurance Act contributions an increase of £750. A decrease of £2 096 in the revenue and of £9 457 in operating expenses left an increase in gross profit of £7 361. Payments to local authorities and debenture interest were about the same figure as in the previous year. General interest charges at £2 698 showed an increase of £864 but interest charges in connection with the Lanark County Tramways, the purchase of which was completed last May, showed a reduction of £1 595. In the 1920 accounts there was also a debit of £1 809 for income tax, whereas there was no such charge for the past year. The company was therefore left with an increase of £9 909 in the net revenue, which enabled them to transfer £10 000 to reserve for depreciation as compared with £9 000 for 1920, and to pay a dividend of 6½ per cent. per annum for the past half-year, which made with the interim dividend for the first half-year a total distribution for the year of 5¾ per cent. as compared with 5 per cent. for 1920. After allowing for the additional remuneration to the directors there was a balance to carry forward of £2 183, as compared with £1 131 brought in. Track renewals during the year, amounting to £5 977, had been debited to depreciation reserve. Capital expenditure during the past year had been very small, and the reserve for depreciation stood at £186 140, representing 36 per cent. of the total capital expenditure.

City and South London Railway.

In the course of his speech at the annual meeting of the City and South London Railway Company last Thursday, Lord Ashfield, who presided, stated that the revision of fares instituted in September, 1920, had proved to be successful and justified, though owing to the coal strike and the continued and growing depression in trade the expected results were not secured. Conditions had not been favourable for making a start with the reconstruction of their line. The company had joined with the London Electric Railway Company in putting forward an application to the Government under the Trade Facilities Act for a grant of sufficient money to enable the reconstruction to be carried out and the line to be re-equipped with modern rolling stock and of larger size. During the year the traffic had declined by more than 9 300 000, which represented a drop of 23 per cent. These figures hardly represented the full extent of the decline, as if the comparison were taken back to the year 1919 the drop was still more. Looking to the future, he saw no reason why the position of the company should not improve. If the volume of traffic should once more show signs of expansion, there would be a speedy amelioration in its prospects. While the traffic was at the present time regrettably reduced, the working expenses showed signs of at least an equal reduction to the traffic earnings. Receipts from railway working after the operation of the Common Fund amounted to £446 999, an increase of £19 008 over 1920, expenditure was £301 441 (£20 470), leaving net receipts of £145 558 (£39 478). Miscellaneous receipts (net) from rents, interest, &c., amounted to £34 309 (£2 000), making a total net income of £179 867 (£41 478). To this sum was added the balance from last year (£18 820), making £198 687. After deducting interest, rentals and other fixed charges (£45 811), appropriation to reserve (£36 000), dividends on preference stocks (£42 500), the balance available for dividend on consolidated ordinary stock was £73 376, against £32 356 in 1920. The interim dividend paid in August last on the consolidated ordinary stock was 2 per cent. This absorbed £29 600, and left £43 776 available, out of which it was proposed to pay a final dividend for the year 1921 on the consolidated ordinary stock of 1¼ per cent., making 3½ per cent. for the year, leaving to be carried forward £25 276. The dividend on the consolidated ordinary stock for 1920 was 1½ per cent., with £18 820 carried forward. The sum of £36 000 had been placed to reserve, an increase of £11 000.

Metropolitan District Railway.

Lord Ashfield (the chairman) presided at the annual meeting of the Metropolitan District Railway last week. For the year ending Dec. 31 last, the receipts from railway working after the operation of the Common Fund amounted to £1 849 581, and expenditure was £1 351 208, leaving net receipts of £498 373, against £164 041 in 1920. Miscellaneous receipts (net) from rents, interest, &c., amounted to £164 180 (£41 323), making a total net income of £662 553 (£122 713). With balance (£20 537) from last year, the total was £683 090. After deducting interest, rentals and other fixed charges (£326 760), appropriation to reserve (£65 000), dividend on guaranteed and preference stocks (£198 430), a balance of £92 900 (£72 363) was available for dividend on ordinary stock. The interim dividend of 2½ per cent. on the second preference stock absorbed £36 750, leaving £129 650 available, out of which the directors recommended a final dividend of 2½ per cent., making the full 5 per cent. due for the year and leaving £92 900 available for distribution on the ordinary stock. The directors recommended payment of a dividend of 1 per cent. for the year on that stock, leaving £60 550 to be carried forward. The dividend paid on the

second preference stock for the year 1920 was 3 per cent., with £20 537 carried forward, no dividend being declared on the ordinary stock. Having regard to the increased cost of all plant and equipment used in railway working, the directors have carried £65 000 to reserve, an increase over 1920 of £20 000. The net capital expenditure for the year amounted to £772 892.

The Chairman said the Government had rejected a scheme submitted by the company last autumn which would provide employment for a large number of men and secure for London much-needed additional traffic facilities, but they had invited the company to make new proposals under the Trade Facilities Act, which they had already done. Briefly, the scheme put forward was to proceed at once with the construction of the Edgware and Hampstead section of the London Electric Railway, and of a junction line at Camden Town between the City and South London Railway and the Hampstead section of the London Electric Railway; the modernisation and re-equipment of the City and South London Railway to take rolling stock of larger dimensions; and with the construction of a connecting line at Wood-lane between the Central London Railway and the Richmond line of the London and South-Western Railway.

As was feared, the unsettled state of labour and the bad trade conditions adversely affected the revenue of the West Kent Company, which was mainly derived from industrial supplies. This fell off from £60 200 to £50 880, the net revenue being reduced from £13 579 to £10 853. The dividend had, however, been maintained at 10 per cent., and £5 000 had been placed to reserve, as compared with £8 000 for 1920; and £2 440 (£1 740) had been carried forward.

It was difficult to forecast results for the current year. There were indications of improvement, and the position up to the present had been well maintained. The units sold for the month of January showed an increase over last year, while there was a reduction in the amount of coal consumed, and the price was, on the average, lower.

Sunderland District Electric Tramways.

Presiding over the annual meeting of the Sunderland District Electric Tramways, Ltd., on Feb. 23, the chairman (Mr. H. R. Hogg) said the company had not been able to earn sufficient to pay anything to the preference or ordinary shareholders, and since the end of the financial year there had been a further disastrous falling off in the receipts. The gross and net losses averaged £327 and £181 per week respectively for the three months. Part of this might be attributable to the heavy snow, but the chief portion was due to the lack of funds in the district generally. If the company was to pay its expenses, it must reduce them all round, and unless labour costs conformed to the surrounding conditions, it was the lesser evil to shut down than to run the trams on their present basis. They had made the men the best offer circumstances allowed, but as the men had stopped work rather than accept them, there had been no alternative but to close the sheds.

The men had been told for some time that there must be reduced wages. A meeting of employers and employees of the tramway undertakings in the country had been held in London, as it had been urged that all wages should be the same in the industry. Their company had always protested against that, because there must be a great difference between large towns and outlying areas. The conference had agreed on a reduction of 3s. a week on the average, but their company had to go further, and ask for a bigger reduction. They were always ready to put the wages up when they could afford it, but they could not work at all at present except at a heavy loss.

Paisley District Tramways.

At the annual meeting of Paisley District Tramways Company last week, the chairman (Mr. O. H. Smith) said that the result of the year's trading was a profit on working of £34 737. After providing for general interest, income tax, interest and sinking fund on debentures, the usual appropriation to general reserve with interest together amounting to £12 139, and further providing the 5 per cent. dividend and sinking fund on the preference shares, the directors recommended a dividend of 4 per cent. on the ordinary shares, and increasing the amount carried forward from £6 546 to £8 033. The amount added to general reserve for the year was £12 139, to the sinking funds £5 754, and to the carry forward £1 487—in all £19 381. The total reserves held by the company at Dec. 31, 1921, amounted to £194 909. The capital expenditure during the year amounted to £1 721, bringing up the total cost of the undertaking to Dec. 31 to £431 309. During last year they had renewed the track, and done special work at Paisley Cross. A considerable amount was being spent on rolling stock. Since the Armistice repair work had been steadily progressing, and by another year they expected to have overtaken the arrears of this work, and the expenditure should then return to a more or less normal amount.

They had been for some time past in negotiation with the Corporation of Glasgow for the sale to them of the company's undertaking. Should Glasgow decide to offer a price that the company considered fair and reasonable, they hoped to complete an agreement for the sale.

Liverpool Overhead Railway.

The accounts of The Liverpool Overhead Railway Company for the year ended Dec. 31, 1921, show gross revenue receipts (including the amount receivable under the agreement with the Government in respect of the control of railways, for the period Jan. 1 to Aug. 15), to be £199 861, and the working expenses, including appropriation to reserve funds, £191 993, leaving £7 868; from this sum had to be deducted interest on debenture stock (£6 755), leaving £1 112, to which was added £6 818 10s., proportion of the amount receivable under Sec. 11 of the Railways Act, 1921, and £5 577, the balance brought forward from 1920, leaving £13 503 available for dividend. The first instalment of the Compensation payable, under the Railways Act, 1921, to this company amounted to £17 937, and the directors have found it necessary to appropriate £6 818 10s. of this sum to pay the dividend on the preference shares. The directors regret that they could not see their way to declare an interim dividend, but recommend the declaration of a dividend for the year ending Dec. 31, at the rate of 5 per cent. on the preference shares, payable on and after March 3, leaving a balance of £5 577 to be carried forward to next year. The total number of passengers carried during the year was 13 389 857 against 21 020 839 in 1920.

Electrical Distribution of Yorkshire.

The accounts of the Electrical Distribution of Yorkshire, Ltd., for 1921 show a net profit, after payment of interest, of £8 086 against £5 426 in 1920. The sum of £1 571 was brought forward, making a total of £9 655 19s. 7d. (£6 578 17s. 11d.). The directors recommend a dividend on the ordinary capital at the rate of 6 per cent. (tax free) for 1921 (of which 3 per cent. was paid in August), which will absorb £4 722. The sum of £2 000 has been added to the reserve fund (increasing this fund to £10 000), and £2 934 remains to be carried forward. The works have been fully maintained out of revenue. The demands in the districts served by the company for lighting, heating, and power continue to grow, and during the year substantial extensions of mains have been made to meet these demands. The Minister of Transport has made an order authorising the company to proceed with the supply of electricity in the districts of Selby, Stanley, Featherstone, Garforth, Horbury, Otley, Penistone and Rawdon, and the Order now awaits confirmation by Parliament. During the year applications have been received for 13 234 ordinary shares of £1 each, bringing up the issued share capital to £83 234. At extraordinary general meetings held on Feb. 22 and March 15 last year, a special resolution was passed and confirmed increasing the nominal capital of the company from £100 000 to £150 000.

Costa Rica Electric Light and Traction.

The accounts of the Costa Rica Electric Light & Traction Company for the year ended June 30, 1921, show the net earnings in Costa Rica, after charging all expenses incurred, to be £25 727, as compared with £24 519 in 1920. The net profit for the year of £3 709, against £12 691 8s., of last year, wipes out last year's deficit of £330 and leaves a surplus of £3 379, of which the directors propose to write off the balance of £745 standing to the debit of "discount and commission on debentures," and carry forward the remainder. The gold premium has averaged 214 per cent. (or C15·70 per £) during the year, as against 160 per cent. (C13·00 per £) last year, and 112 per cent. (or C10·60 per £, the normal equivalent of the gold "Colon") in the year (1913-14) before the war. At the last-mentioned rate the net profit in Costa Rica for the year under review, which amounts to C403 916·78 (an increase of C95 168 on that of year ending June, 1920) would have been £38 105, as against £25 727, the difference between the current and normal exchange representing a loss of £12 378. All buildings, machinery, plant, &c., have been kept in good working order. The first two deferred warrant issues, amounting, with interest accrued, to £5 417, were paid on March 1 and July 1 last respectively.

Tyneside Tramways & Tramroads.

At the annual meeting of the Tyneside Tramways & Tramroads Company, the Chairman (Dr. J. T. Merz) said that during the past six months, and during the whole of 1921 things had been very difficult. In the first three months of the year the takings had gone up: after that came the coal trade stoppage; and traffic receipts had gone down very considerably. They had, for the whole of the year, been 6 per cent. less than in 1920. The car miles run were about 7 per cent. less, but the passengers carried were 15 per cent. less. They had taken out of reserve for permanent way repairs and rolling stock over £6 000, but they had placed in reserve, out of the profits of the year, £2 700. He regretted that the ordinary dividend would be the smallest paid since 1912. As to the prospects of the company, he thought that, on the whole, there was a slight indication of improvement. They could not be certain that that improvement would continue, but if they went on as they were doing now, they should have a better year than last year.

Lancashire United Tramways.

The Lancashire United Tramways' report for 1921 shows a profit, less working expenses, cost of generating electrical energy sold, general charges (including direction, management, etc.), and rent of leased lines, of £28 217. Receipts show a decrease of £14 881, and expenditure an increase of £7 754. Interest and dividends from operating company, plus motor coach and sundry receipts, was £69 761. Deducting motor coach and other expenses and interest on prior lien debenture stock, there remains a balance out of which interest at 2½ per cent., less tax, will be paid on the second mortgage debenture stock for the year, leaving £1 126 for depreciation. The balance on the working of the operating company, after payment of interest and dividend, was £10 248. Depreciation and renewal account (after writing off £5 000 for depreciation on motor coaches and omnibuses) and amounts carried forward in combined companies now amount to £183 642.

Rushden and District Electric Supply Company.

In the annual report of the Rushden and District Electric Supply Company the directors state that, in spite of the depression in trade during the past year, the output of electricity has been practically the same as during the previous year. Lighting and heating connections have increased by the equivalent of 2 131 32-W lamps, making a total of 9 483. Motors have increased from 761 H.P. to 776½, of which 292 are let out on hire. The maximum load on the plant was 440 kW, and the number of units sold was 580 615. Distributing mains have been laid to the extent of 728 yards, making a total of 6 miles 600 yards. The sum of £2 000 has been added to the depreciation fund (out of which £100 has been allocated to motors), and the balance of the preliminary expenses (£500) has been written off. The directors propose a final dividend of 4½ per cent., making with the interim dividend of 3 per cent. already paid, 7½ per cent. for the year, compared with 6½ per cent. for the previous year. This will amount to £1 125, and there will remain £805 10s. to be carried forward.

London and South-Western Railway.

In the course of his remarks to the shareholders at the annual meeting of the London and South-Western Railway Company, last week, the Chairman, Brigadier-General H. W. Drummond, stated that although the alterations at Waterloo Station were now nearing completion, it was not improbable that in another ten years' time it might be necessary to make further extensions, as even now the station was barely equal to the enormous increase of traffic brought about by the electrification of the suburban lines. In regard to fares, the board would be only too willing to make reductions at the earliest opportunity. Referring to the congested state of the line between Clapham Junction and Waterloo and on the Waterloo and City Railway, he stated that it would be a matter of only a few weeks before the new rolling stock was placed on the line.

Llandudno & Colwyn Bay Electric Railway.

The profit for the year to Nov. 30, 1921, of the Llandudno & Colwyn Bay Electric Railway, after providing for operation and administration costs and for interest on debenture stock and loans, amounts to £6 194 10s., to which is added £2 548 brought forward from 1920, making a total available balance of £8 743. Out of this sum £2 040 has been appropriated for redemption of debenture stock, leaving £6 703, which the directors recommend should be applied as follows :—£2 500 to reserve for repairs and renewals, £2 783 in payment of a dividend of 4 per cent., less income tax, requiring £5 283, leaving to be carried forward £1 420. In accordance with the practice adopted for several years, the sinking fund instalment due on Jan. 1 has been charged against the revenue for the year, and no further provision has been made for depreciation of the system. The total of the fund now amounts to £18 793.

W. T. Henley's Telegraph Works.

The report and accounts of W. T. Henley's Telegraph Works Company, Ltd., for the year 1921 show a profit of £263 079, from which £38 339 has to be deducted for directors' and auditors' fees, debenture interest, and amount written off for depreciation on buildings, machinery, &c., leaving £224 740. To this sum has to be added the amount brought forward from 1920 (£183 538) and the reserve against Government loans and trustee securities written back £7 559 10s., making a total of £415 837. After deducting income tax (£26 214), transfer to reserve (£22 879), dividend on preference shares to Dec. 31, 1921 (£9 000), and interim dividend on ordinary shares (£32 500), there remains an available balance of £325 244. The directors recommend a final dividend on the ordinary shares of 2s. per share, less income tax, making 3s. for the year. This will require £65 000, leaving £260 244 to be carried forward to next year.

Northampton Electric Light & Power.

The Northampton Electric Light & Power Company's report for 1920 shows a net revenue, before paying debenture interest, of £38 142. A sum of £19 681 has been added to depreciation, out of which £1 681 has been allocated to motors, £7 000 to reserve and £2 000 to battery suspense fund. It has been decided to form an employees' benevolent fund, and £500 has been put aside for this. The directors propose a balance dividend on the ordinary shares at the rate of 5½ per cent., making, with the interim dividend 9 per cent. for the year, compared with 8 per cent. for the previous year. There will be £4 564 to be carried forward, against £1 500 brought in.

Toronto Railway.

The gross earnings of the Toronto Railway to Aug. 31 last, being the end of the franchise, were $5 130 431, and operating charges, maintenance, &c.; totalled $4 782 490, leaving $347 941. After providing for various charges, including bond interest ($113 625), war and provincial taxes ($38 890), percentage on earnings to city ($1 004 894), general taxes ($121 999), a deficit of $997 299 is carried forward. The report states that the proposed sale to the Hydro-Electric Commission of Ontario of power and radial railway interests of the company has been unanimously approved by the shareholders. An agreement may be completed within a few weeks, when it will require to be submitted to trustees for bondholders in London for ratification.

London & North-Western Railway Company.

At the annual meeting of the London & North-Western Railway Company, last week, the Chairman (the Hon. Charles Napier Lawrence) said that with regard to capital expenditure, they had spent during the year £1 703 000, of which £912 600 was in respect of steamers, £521 000 in connection with the electrification of the Euston to Watford line, and the balance for sundry works. He was glad to be able to say that, for some time past, the company's financial position had been appreciably improving, and it had never stood higher than it stood at the present moment.

The National Boiler & General Insurance Company has declared a dividend of 20s. per share.

Consolidated Gas, Electric Light & Power Company of Baltimore announce the regular quarterly dividend of $2 per share on the preferred and common stock.

The issue last week by the Yorkshire Electric Power Company of £558 360 in 111 672 six per cent. cumulative preference shares of £5 each, fully paid, at £4 per share, was immediately oversubscribed.

The Chelsea Electric Supply Company announce a dividend at the rate of 7 per cent. per annum for the half year, making 6 per cent. for the year ended Dec. 31 last. The sum of £415 is carried forward.

Belfast Corporation are this week issuing £1 000 000 5½ per cent. redeemable stock at 96. This loan is to provide the capital expenditure necessary to complete the new electricity station, the first portion of the reconstruction of the tramways track, &c.

Vickers, Ltd. have declared final dividends for the half-year ended Dec. 31 of 2½ per cent. on the preferred 5 per cent. stock (less tax); 2½ per cent. on the 5 per cent. preference shares (less tax); and 2½ per cent. on the cumulative preference shares (free of tax).

The Metropolitan Electric Supply Company recommend a final dividend of 5s. per share, which, with the interim dividend of 2s. already paid, makes a total of 7s. per share, or 7 per cent., for the year 1921. The amount set aside for depreciation and reserve is £94 892 and the carry forward £3 609.

After appropriating to depreciation and reserve accounts sums amounting to £15 100, the directors of the Brompton and Kensington Electricity Supply Company propose to pay a final dividend on the ordinary shares at the rate of 15 per cent. per annum, making 12 per cent. for the year, less tax, carrying forward £3 732.

Traction & Power Securities Company recommend a final dividend for 1921 at the rate of 4s. 6d. per share, free of tax, making 8s. per share, free of tax. The net revenue was £35 578 plus £12 722 brought forward, making £48 300. The sum of £14 136, subject to corporation tax, is carried forward.

The annual meeting of the Lanarkshire & Ayrshire Railway Company was held in Glasgow last week, Mr. H. E. Gordon, chairman, presiding. The report for the year ending Dec. 31 last was adopted, and it was decided to pay a dividend of 2 per cent. for the year, inclusive of the interim dividend paid in September last.

The report of Notting Hill Electric Lighting Company for 1921 shows available profit of £41 866, less depreciation, renewal and reserve fund £3 000, special reserve £3 000, income tax £6 469, and excess profits duty £1 118. A dividend is recommended on the ordinary shares at the rate of 8s. per share, free of tax, leaving £3 920 to be carried forward.

The traffic receipts of the London United Tramways for 1921 totalled £575 837. Adding advertising and sundry receipts, the gross revenue was £584 030, an increase over 1920 of £51 238. Working expenses were £473 573, a decrease of £9 024. The balance on working was £110 456, an increase of £60 312. After charging debenture stock and loan interest, there is a surplus of £59 474 as reduction of deficiency of £70 882 brought forward.

The net revenue of the Oxford Electric Company for 1921, including £108 brought forward, was £15 466 (against £11 779 in 1920, when £186 was brought forward). After providing debenture interest, &c., the balance available is £11 357. It is proposed to pay a dividend for the year on the ordinary shares of 5 per cent. (of which 2½ per cent. has been distributed), to place £3 588 (against £457) to reserve and renewal of plant, and to carry forward £20.

Addressing the shareholders at the annual meeting of the North London Railway Company, last week, the Chairman, the Hon. A. H. Holland-Hibbert, said that they had a valuable concern; the line was in a thoroughly efficient state, electrification had tempted back many of their lost passengers, and they had been building up their reserves until to-day they were on a decidedly satisfactory financial basis.

The 1921 revenue of the Mersey Railway Company available for payment of interest amounts to £53 890, and is sufficient to meet the full interest on the various classes of debenture stock, with a balance of £207 carried forward. The total passengers carried, exclusive of season ticket holders, was 11 046 955, against 12 637 352 in 1920. There has been no dividend on the preference or ordinary stock for many years, but the position has been greatly improved by the introduction of electric traction.

The report of the British Mannesmann Tube Company for year ended June 30, 1921, states that the amount of the twentieth drawing of first mortgage debentures was £4 000. Profit, including excess profits duty adjustment, after deducting works charges and depreciation, was £101 948, plus interest and dividends, royalties, rents, &c., £10 537, and the balance brought in, £76 318, less general administration expenses, £49 656, making £139 147. The directors recommend a dividend of 4 per cent., free of income-tax, carrying forward £55 914.

New Companies.

A. P. T. Ltd.

A. P. T. Ltd. (179 633). Private company. Registered Feb. 11. Capital, £3 000 in £1 shares (750 "A" and 2 250 "B"). To adopt an agreement with A. F. de Fraine, S. J. Clark and G. A. L. Sartoris, trading as "de Fraine & Clark," of 23, Old Queen-street, Westminster, to acquire all or any of the inventions and patents referred to therein in respect of the variable hydraulic transmission system and improvements in the said inventions, and to carry on the business of mechanical, general and electrical engineers, &c. Subscribers (each with one share): C. A. Browning and C. T. Twort. Registered office: 5, Fenchurch-street, E.C.

Auto-Electrical Services, Ltd.

Auto-Electrical Services, Ltd. (179 760). Private company. Registered Feb. 17. Capital, £2 500 in £1 shares. To take over an agreement made between C. A. Vandervell and Co., and R. V. Steward to acquire a process of manufacturing dry batteries, and to carry on business as manufacturers, sellers or agents for the sale of dry batteries and accumulators, manufacturers of electrical appliances, etc. Permanent directors: N. F. Steward, and R. V. Steward, with power to appoint other directors. Secretary, C. Brassington. Registered office: 14, Lichfield-street, Wolverhampton.

Brasse, Ltd.

Brasse, Ltd. (179 842). Private company. Registered Feb. 21. Capital, £10 000 in £1 shares. To acquire the business carried on by E. P. Brasse, and to carry on business as electrical cable and surgical instrument manufacturers, electrical engineers, metal workers, &c. First directors: E. P. Brasse and E. W. Brasse. Qualification (except original directors), 100 shares. Registered office: Calvert Works, South Tottenham, N.

Foundation Company, Ltd.

Foundation Company, Ltd. (179 870). Private company. Nominal capital, £250 000 in £1 shares (150 000 8 per cent. cumulative preference and 100 000 ordinary). To acquire (upon the terms of an agreement with the Foundation Company, of New York) the goodwill and rights referred to therein; to acquire, build, work, or control in any part of the world railways, tramways, hydraulic, electric, engineering and improvement works, and to carry on the business of electrical, mechanical, hydraulic and general engineers and contractors, &c. Subscribers (each with one share):—F. D. Billett and W. J. Hill. Registered office: Windsor House, Kingsway, W.C.

Kay Models, Ltd.

Kay Models, Ltd. (179 774). Private company. Registered Feb. 17. Capital, £5 000 in £1 shares (3 000 preference and 2 000 ordinary). Mechanical, electrical, agricultural, constructional and modelling engineers, etc. Permanent directors: A. Goodlett, J. K. Goodlett, A. K. Goodlett, and H. H. Bowyer. Qualification, £50. Registered office: 65, Park-road North, Acton, W. 3.

Kaye & Company (Huddersfield), Ltd.

Kaye & Company (Huddersfield), Ltd. (179 644). Private company. Registered Feb. 11. Capital, £10 000 in £1 shares. To take over the business of ironfounders carried on by J. Firth and J. E. Lunn, as "Kaye & Company," at Crosland Moor, Huddersfield, and elsewhere, and to carry on the business of ironfounders, mechanical and electrical engineers, &c. First directors: J. Firth, J. E. Lunn, R. Carrick, and H. Cotton (all permanent, subject to each holding 500 ordinary shares). Solicitors: Hall, Walker & Norton, Huddersfield.

H. S. Kemp & Company, Ltd.

H. S. Kemp & Company, Ltd. (179 718). Private company. Registered Feb. 15. Capital, £1 200 in £1 shares. Electrical engineers, manufacturers of electric lamps and fittings, &c. First directors: W. F. Bond (or such other person as shall be nominated by Belco, Ltd., of Windsor House, Kingsway, W.C.); E. A. Boxall, H. S. Kemp, and A. E. Cage. Registered office: 25, Stephen-street, Tottenham Court-road, W.C.1.

Metallisation, Ltd.

Metallisation, Ltd. (179 721). Private company. Registered Feb. 15. Capital, £75 000 in £1 shares. To acquire any inventions relating to the coating of surfaces with metal, and/or applying deposits of metal or metallic compounds to surfaces; and to adopt agreements (1) with W. J. Thompson and (2) and (3) with E. T. White. Subscribers: C. Tilt, Wembley Dene; C. P. N. Raikes. First directors: W. J. Thompson (chairman), E. T. White (managing director), and G. Dennison. Solicitors: Francis & Johnson, 19, Great Winchester-street, E.C.

James Moores & Co. (Sundries) Ltd.

James Moores & Co. (Sundries) Ltd. (179 790). Private company. Registered Feb. 18. Capital £5 000 in £1 shares. To acquire the business carried on by J. Moores at 14 Ridgefield, John Dalton-street, Manchester, as "James Moores & Company," and to carry on the business of manufacturers of, dealers in, and/or agents for electric lamps, accessories, cables, wires, flexibles and glassware for electrical, gas, lighting and other purposes, engineering sundries, &c. First directors: J. Moores, Dr. R. H. King, J. Higginbotham and P. Moores. Registered office: 14, Ridgefield, John Dalton-street, Manchester.

National Signs, Ltd.

National Signs, Ltd. (179 824). Private company. Registered Feb. 20. Capital, £42 000 in £1 shares. To acquire the business of National Signs, Ltd. (in liquidation), to adopt an agreement with the said old company and W. H. Worrall (their liquidator), and to carry on the business of electrical and illuminated sign manufacturers, glass process workers, manufacturers of and dealers in advertising and other signs and novelties, &c. Subscribers (each with one share): W. H. Worrall, H. H. Scott (chairman) and G. M. Scott. Registered office: Factory-lane, High-road, Tottenham, N.

Pace Engines, Ltd.

Pace Engines, Ltd. (179 792). Private company. Registered Feb. 18. Capital, £10 000 in £1 shares. To adopt an agreement with T Andrews and to carry on the business of engineers, electricians, makers of internal combustion and other engines, &c. First directors: T. Andrews and H. Singleton. Registered office: 20, Buckingham-street, Strand, W.C. 2.

Reynard Electrical Company, Ltd.

Reynard Electrical Company, Ltd. (179 910). Private company. Registered Feb. 23. Capital, £500 in £1 shares. Manufacturers, importers, and exporters of, agents for, and dealers in, lamps, brackets, shades, connections, switches, ceiling roses, plugs, cable conduit motors and all electrical apparatus and accessories. First directors: J. Cowan (chairman) and W. J. R. Fox. Registered office: Dickinson-street, Manchester.

Sheepbridge Stokes Centrifugal Castings Company, Ltd.

Sheepbridge Stokes Centrifugal Castings Company, Ltd. Private company. Nominal capital, £50 000 in £1 shares (7 500 "A" and 42 500 ordinary). Manufacturers of and dealers in machinery, castings, motors, tools and hardware, iron and steel converters, mechanical and electrical engineers, &c., and to adopt an agreement with the Stokes Castings, Ltd. First directors: W. B. M. Jackson (chairman), J. T. Goodwin, and F. W. Stokes (nominee of Stokes Castings, Ltd.). Secretary: T. E. Haslam. Registered office: The works of the Sheepbridge Coal & Iron Company, Ltd., Chesterfield, Derbyshire. File number is 179 750.

The Electrical Trades' Directory.

The fortieth edition of "The Electrician" Electrical Trades' Directory and Handbook, the well-known Blue Book, is now available. The new issue, which has undergone careful revision, has grown in size by about fifty pages; about 1 000 more firms and names have been included in the Alphabetical Section, and corresponding additions have been made to the Classified Trades portion. In the alphabetical section will be found the name, trade or professional description and address of practically everyone engaged in or connected with the important and rapidly expanding Electrical and Allied Trades, while under the headings in the Classified Trades there are very full and representative lists of persons and firms engaged in the manufacture, supply or erection of electrical plant and apparatus. The Colonial and Foreign sections have also undergone similar expansion and revision.

The Handbook Section contains much valuable technical, commercial and legal information relating to the electrical industry, but space will only permit of the enumeration of some of the more important features. There are a number of electro-technical tables and data, particulars of resistance materials, electric supply cables, wire gauges, aluminium data, illumination notes, &c. Particulars are also given of the work of the British Engineering Standards Association and of the International Electrical Commission, the Imperial ohm, ampere and volt, the Standardisation Rules of the British Electrical and Allied Trades Association, details of the import duties leviable on electrical machinery in the British Dominions and Colonies and in foreign countries, &c.

The Telegraph and Telephones Section contains the International Telegraph Convention, particulars of the work of the International Telegraph Bureau, the International Service Regulations, statistics of the submarine cables and landlines of the world, telegraph tariffs, the world's cable-laying fleet, the International Radio-Telegraph Convention, British Wireless Telegraph Regulations, International Call Signals, technical details of Anglo-Continental telephone cables, and a digest of the law relating to telegraphs and telephones.

Particulars are included of the constitution and officers of all British, Colonial, and Foreign Engineering, Scientific and Industrial Societies, the names of the professors and teachers of engineering and scientific subjects in universities, university colleges and technical schools, the chief officials of the engineering and technical sections of the British, Colonial and Foreign Government Departments, the Rules of the Institution of Electrical Engineers relating to electric wiring and the electrical equipment of ships, &c.

A special feature of the Handbook Section of the Directory is the full Digest of the Law of Electricity Supply and Electric Traction, and the present issue includes all the latest Regulations, Orders and requirements of the Electricity Commissioners and of the Ministry of Transport relating to electric supply powers and the operation of electric tramways. The Regulations as to the use of electricity in Mines and Factories are also given.

The Directory and Handbook has now reached its fortieth year, and with each succeeding issue its utility, influence and circulation have grown. For many years the Blue Book has been the recognised work of reference for the whole of the electrical industry, and it is felt that the improvements effected in the present edition will ensure for it an even warmer welcome than that accorded to previous issues, and that it will continue to be indispensable to the supply engineer, to the consulting, contracting and manufacturing electrical engineer, as well as to suppliers of and dealers in electrical plant and apparatus. It is published at 25s. net by Messrs. Benn Brothers, Ltd., 6 and 8, Bouverie-street, Fleet-street, London, E.C.4.

COMMERCIAL INTELLIGENCE.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

London Gazette.

Bankruptcy Information.

LIDDELL, Robert Henry, under the style of LIDDELL & McINNES, at 4, The Crescent, Carlisle, electrical engineer. Receiving order, Feb. 21. Debtor's petition.

WILLIAMS, Aneurin Tudor, and BEVAN, William John, trading as THE ELECTRICAL & GENERAL ENGINEERING COMPANY, at 49, Commercial-street, Aberdare, electrical engineers. Receiving order, Feb. 21. Creditor's petition.

Notice of Intended Dividend.

BENNETT, William, Back Sitwell-street, Derby, electrical contractor. Last day for receiving proofs, March 17. Trustee, E. W. Humphreys, 4, Castle-place, Nottingham.

Company Winding-up Voluntarily.

WAKELINS, LTD. P. J. Goodchild, 16, Tokenhouse-yard, Lothbury, London, E.C. 2, appointed liquidator. Meeting of creditors at 7, Tottenham-street, Tottenham Court-road, London, W. 1, on Wednesday, March 8, at 12 noon.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

BRADBEER, John Edward, 2c, England's-lane, Belsize Park, electrical engineer, and BARRETT, Edward, 97, Malden-road, Kentish Town, furniture dealer. £20 16s. 1d. Dec. 8.

BRADBEER, Mr. W., 2A, England's-lane, Hampstead, electrical engineer. £11 10s. 10d. Dec. 22.

CALDWELL, WILLIAM, & SONS, Victoria-road, Hale, electrical engineers. £11 13s. 1d. Dec. 21.

CLYNE & DEAKIN, 84, Tilton-road, Small Heath, electrical manufacturers. £22 10s. 5d., Dec. 7; and £22 6s. 9d., Dec. 5.

ELECTRO MOTOR REPAIR & MAINTENANCE COMPANY, 252, Hackney-road, E. 2., electricians. £14 0s. 1d. Dec. 7.

FORSTER, George, 33, Barkley-road, Beeston, Leeds, and PRINCE, George Edward, 34, Balkan-grove, York-road, Leeds, electricians (late trading as FORSTER & PRINCE). £13 6s. 2d. Dec. 22.

GIBBONS, A. R., 8, The Parade, New Eltham, S.E. 9, electrical engineer, &c. £31 2s. 6d. and £20 15s. 8d. Dec. 19.

HARRIS, Sydney Henry (trading as MANCHESTER MAGNETO REPAIRING COMPANY), 191, Chapel-street, Salford, electrical engineer. £108 3s. 11d. Dec. 20.

LONDON ELECTRICAL ENGINEERING COMPANY, 2, Finsbury-avenue, E.C. 2. £66 15s. 8d., Dec. 16; and £33 17s. 4d., Dec. 5.

MACAULEY, Mr. R. A., 48, Ashton New-road, Beswick, Manchester, electrical contractor. £27 15s. 11d. Dec. 21.

MORETON & LUSH, 10, Tower-chambers, Church-street, Cardiff, electrical engineers. £21 12s. 8d. Dec. 8.

TUFFNELL, MONTAGUE H., & COMPANY, Brighton Railway Chambers, Clapham Junction, S.W., electrical manufacturers. £21 15s. 9d. Dec. 21.

Bankruptcy Proceedings.

BENNETT, Charles Godolphin, engineer and agent, 66, Mark-lane, London, E.C. The public examination of this debtor was held at the London Bankruptcy Court last week, when a statement of his affairs was submitted, showing liabilities £2 133 and an estimated deficiency of £1 174. The debtor stated that in March, 1916, he was approached by another person with a view to his taking an interest in an electrical business, the particular line being the manufacture of electric switch holders. He provided £2 000, which was used in experimenting and in part payment of fifty gross of switch holders which he ordered to be manufactured. In order to complete payment for them he approached his brother, who had previously financed him, but owing to losses incurred in Russia he was unable to help him. The orders for the switch holders were placed by him (debtor) personally, and there was now owing £620 to various firms who supplied them. The Official Receiver: Why should you become interested in this venture? You are not an electrical engineer. The debtor: No; but I know more about it than a good many electrical engineers. (Laughter.) The debtor added that his creditors had accepted his offer of a composition of 7s. 6d. in the £. The examination was concluded.

SCOTT, Thomas, and CAMPBELL, James (trading as T. SCOTT & COMPANY), 42, Handyside's-arcade, Percy-street, Newcastle-on-Tyne, wholesale electrical suppliers. The first meeting of creditors of the above was held last week at Newcastle-on-Tyne. Debtors commenced business in March, 1920, Campbell managing the business, while Scott, who was in a situation, assisted with the book-keeping. The statement of affairs showed liabilities of £1 179, assets were estimated to realise £402, or a deficiency of £777. In August last a writ for £66 was served on debtor and paid; in December executions for £73. £20, and £10 were levied and paid. A further execution levied on Jan. 27 last was the immediate cause of failure. The creditors decided to appoint Mr. Wm. Brittain, of 15, Pilgrim-street, Newcastle-on-Tyne, as trustee, with a committee of inspection. At the public examination, also held last week, debtor Campbell said he was in the army between September, 1914, and June, 1919, when he returned to his situation as an electrical engineer until March, 1920. He was then joined by Scott, and they traded at their present address as wholesale electrical suppliers. They had £100 capital, and borrowed £160 from friends, of which £10 had been repaid. They became aware of their position about July, 1921, but continued trading in the hope that business would improve. Proper books of account had been kept. The examination was adjourned to be closed. The following are creditors: B.T.T. Electric Lamp Company, London, £55; Campbell, J. W., Gateshead, £50; City Electric Company, London, £192; Fullers United Electric Works, Ltd., Chadwell Heath, £39; Foster Engineering Company, Wimbledon, £28; General Electric Company, Newcastle-on-Tyne, £49; Gledson, J., & Company, Newcastle-on-Tyne, £255; Jeary Electric Company, Ltd., London, £16; Lee, A., & Company, Newcastle-on-Tyne, £24; North of England Engineering and Electrical Manufacturing Company, Newcastle-on-Tyne, £13; Metropolitan-Vickers Electric Company, Ltd., Manchester, £24; Stella Lamp Company, Ltd., London, £38.

SLAUGHTER, Mihill Loraine, 91, Victoria-street, S.W. This debtor attended at the London Bankruptcy Court last week for public examination, on a statement of affairs showing gross liabilities £12 683 (unsecured £10 893) and assets valued at £2 210. The debtor said that in March, 1920, a company was registered as M. L. Slaughter & Company, Ltd., to acquire and carry on certain agencies belonging to him. In August, 1921, the company bought from the Astral Intensifier, Ltd., the exclusive British rights for five years relating to the manufacture of an intensifier or reflector for electric lamps, of which the Astral Company held the patents. His company agreed to manufacture and sell 250 000 intensifiers per annum and to pay a royalty of fourpence on each one to the Astral Company. Later on his company appointed Overseas Contracts, Ltd., to be their selling agents for the whole of Great Britain, provided that they sold 300 000 intensifiers per annum. The retail price was fixed at 3s., and they manufactured the intensifier at 1s., out of which they had to pay the royalty, and sold it to the Overseas Contracts, Ltd., for 2s. If this contract had been carried through, the company's profit would have reached £10 000 a year, but the Overseas Contracts, Ltd., failed to complete it, and went into voluntary liquidation in April last. Owing to that failure his company also went into liquidation, and that in turn brought him down, as he had incurred heavy liabilities on behalf of the company. The examination was ordered to be concluded.

Private Meeting.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

GOODALL ELECTRIC, LTD. (in voluntary liquidation), convened by notice. At the statutory meeting of creditors held recently at Liverpool, the voluntary liquidation was confirmed, with Mr. A. G. Turner as liquidator. The company was formed in 1920 to take over the Standard Electric Company, under which style T. J. Stapley, W. J. Mills and T. G. Jones traded from an address in South Castle-street, Liverpool. This firm being in difficulties over a country house contract towards the end of 1919 asked S. Chetter & Son to complete the contract on their behalf, and so became indebted to the latter firm to the extent of £123. The Standard Electric Company prevailed upon S. Chetter & Son to purchase necessary plant, tools and raw materials, which were intended to be taken by the Goodall Electric, Ltd., for producing "splitters" of various numbers of ways, invented by Mr. Stapley, Chetters to be reimbursed out of sales and profits. Premises were acquired, and when the first case of "splitters" were completed the company submitted samples to the Electric Brasswares, Ltd., who concluded an agreement whereby they were to take up the output of the Goodall Electric, Ltd. The failure of the Goodall Electric Ltd., is solely attributed to the repudiation of the contract on the part of Brasswares, Ltd. Mr. Chetter made an offer to various creditors of a composition of 2s. 6d. in the £ on the amount of their debt. Two firms refused to accept the offer made to them and one commenced proceedings. The liquidator's statement of affairs shows liabilities £1 116 and assets estimated to realise £101.

Tenders Invited and Accepted.

UNITED KINGDOM.

GREAT NORTHERN COMPANY (IRELAND). March 8.—Six months' supply of (14) electrical fittings, lamps, &c.; (15) electric cable and wire. Particulars from the Secretary, J. B. Stephens, Amiens-street Station, Dublin.

NUNEATON CO-OPERATIVE SOCIETY. March 8.—Electric lighting of Stockingford and Whittleford branches. Specifications from the General Manager, Abbey-street, Nuneaton.

RATHMINES AND RATHGAR URBAN COUNCIL. March 11.—Electric lamps, meters, oils, engine-room stores, &c., for the Electricity Department.

EDINBURGH CORPORATION. March 14.—Manufacture and supply of 130 tons of steel tramway rails. Specification, &c., from the Tramways Manager, 2, St. James-square, Edinburgh.

SHOREDITCH GUARDIANS. March 15.—Six months' supply of electrical goods. Particulars from the Clerk, Mr. J. C. Clay, Clerk's Office, 213, Kingsland-road, E. 2

BLACKPOOL ELECTRICITY COMMITTEE. March 16.—One natural draught-cooling tower for a duty of 300 000 gallons per hour. Particulars from the Borough Electrical Engineer and Tramways General Manager, Mr. C. Furness.

CARDIFF CORPORATION. March 17.—40 000 lb. water-tube boiler, with mechanical stokers and accessories. Particulars from the Electrical Engineer, Central Offices, The Hayes, Cardiff.

RHONDDA URBAN COUNCIL. April 3.—House-service a.c. meters, cable, joint boxes, cut-outs, &c., for one year. Specification, &c., from the Engineer, Electricity Works, Porth, Glam.

LEEDS.—H.M. COMMISSIONERS OF WORKS. April 12.—Electrical engineering labour-in-daywork in the Leeds district. Particulars from the Contracts Branch, H.M. Office of Works, King Charles-street, London, S.W. 1.

CANADA.

CANADIAN FIRM. IMMEDIATELY.—*Hoist, electrically operated and arranged, to be driven by a 200 H.P., three-phase, 550 V, 485 revs. per min. induction motor, which will be supplied by the company. The drive from the motor will be through a Francke flexible coupling and Wuest-type herringbone gears.

AUSTRALIA.

POSTMASTER-GENERAL'S DEPARTMENT, BRISBANE. April 19.—* Supply and delivery of testing and telegraph instruments, including d.c. ammeters, a.c. bridge condenser coil, condensers, cross-talk meters, detectors, milliammeters, polarised relays, and artificial telephone cable boxes. (Stores Schedule No. 549.)

EAST HAM Corporation have accepted the tenders of Bruce, Peebles & Company for a motor converter, £5 749, and A. Reyrolle & Company, for switchgear, £1 627 10s., plus £116 for additional items if required.

SHOREDITCH (London) Council have accepted the tender of the Stirling Boiler Company for a water-tube boiler of 33 000 lbs. evaporative capacity. Six offers were received, ranging from £10 180 to £14 463.

HULL Corporation Tramways Committee have accepted the tender of Messrs. Scott, of Leeds, for 1 000 tons of steel rails at £12 per ton, plus 12s. 6d. for special treatment. The lowest German tender was £11 15s., with £1 per ton for special treatment.

LONDON County Council have accepted the tender of Clayton and Shuttleworth (lowest tender) for three water-tube boilers, superheaters and economisers, with multiple retort stokers, at £61 392. Seven tenders were received, including stokers, the highest being £84 664, and one tender, exclusive of stokers, was £65 345. Five tenders for stokers and fans only varied from £9 755 to £12 490.

LONDON County Council have also accepted the tender of Walter Scott, Ltd., for 2 600 tons of track rails and fastenings at £28 667, or 4 700 tons, £50 307 5s., subject to negotiations with the company as to the quantity of rails required. The accepted tender was the lowest of those from British manufacturers, the highest being £36 354 14s. and £67 108 9s., for 2 600 and 4 700 tons respectively. The three lowest tenders varying from £26 972 16s. to £28 002 5s. for 2 600 tons and from £48 175 7s. 6d. to £50 065 12s. for 4 700 tons were for rails made on the Continent.

In connection with the big contracts recently obtained by Spencer & Company and Henry Simon, Ltd., for the ERECTION OF ELEVATORS in DURBAN, CAPE TOWN, and elsewhere in South Africa, a number of sub-contracts have already been allocated. The order for oil engines goes to Ruston & Hornsby, for electric motors to the English Electric Company, electric lifts to A. & P. Steven, hopper scales to W. & T. Avery, hydraulic machinery to Fielding & Platt, conveyor and elevator belting to Leyland & Birmingham Rubber Company, capstans to the New Switchgear Construction Company, and driving chains to Hans Renold. The Messrs. Ruston & Hornsby contract is for thirty-eight heavy oil engines (of about 2 500 B.H.P. aggregate) for the South African Railways and Harbours Department, for driving grain elevator machinery and for electric lighting purposes in different parts of the country. The order, which is understood to be for approximately 2 500 B.H.P., was secured after very severe competition.

* *Particulars from the Department of Overseas Trade.*

Arrangements for the Week.

FRIDAY, March 3rd (to-day).

JUNIOR INSTITUTION OF ENGINEERS.

8 p.m. At Caxton Hall, London, S.W. Lecturette on "Factory Administration," by Mr. E. T. Elbourne.

MONDAY, March 6th.

SOCIETY OF ENGINEERS.

5.30 p.m. At the Geological Society, Burlington House, London, W. Paper on "The Testing of Small Electrical Plant," by Dr. C. V. Drysdale.

INSTITUTION OF ELECTRICAL ENGINEERS.

WESTERN CENTRE.

6.30 p.m. At the Merchant Venturers' Technical College, Bristol. Paper on "Induction Type Synchronous Motors," by Mr. L. H. A. Carr.

INFORMAL MEETING.

7 p.m. At Savoy-place, London W.C. Discussion on "E.H.T. Cable Testing," opened by Mr. E. Ambrose.

ROYAL SOCIETY OF ARTS.

8 p.m. At John-street, London, W.C. Cantor Lecture on "The Mechanical Design of Scientific Instruments," by Prof A. F. C. Pollard. (Lecture III.)

TUESDAY, March 7th.

INSTITUTION OF CIVIL ENGINEERS.

6 p.m. At Great George-street, London, S.W. Paper on "The Improvement of the Port of Valparaiso," by Messrs. A. C. Walsh and W. F. Stanton.

INSTITUTION OF ELECTRICAL ENGINEERS.

EAST MIDLAND SUB-CENTRE.

7 p.m. At the Technical College, Derby. Paper on "The X-Ray Examination of Materials," by Mr. J. F. Driver.

SOUTH MIDLAND STUDENTS' SECTION.

7.30 p.m. At the University, Edgbaston. Paper on "The Measurement of Flux Density in the Air Path of a Magnetic Circuit," by Mr. W. P. Conly, B.Sc.

ROENTGEN SOCIETY

8.15 p.m. At Institution of Electrical Engineers, Savoy-place, London, W.C. Papers on "Comparisons Between the Therapeutic, Photographic and Ionisation Effects of Ultra-Violet and of Beta Radiation," by Messrs. L. H. Clark and B. D. Watters, and "Apparatus for Deep X-Ray Therapy." Mr. E. E. Burnside.

WEDNESDAY, March 8th.

INDUSTRIAL LEAGUE AND COUNCIL.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "The Personal Factor in Industry," by Miss B. Voysey.

ASSOCIATION OF ENGINEERS *in* CHARGE.

7.30 p.m. At St. Bride's Institute, Bride-lane, London, E.C. Paper on "Thermal Efficiency of Small Power Stations and Methods of Comparison," by Mr. A. H. Seabrook.

ROYAL SOCIETY OF ARTS.

8 p.m. At John-street, London, W.C Paper on "The Proper Functions of Trade Unions," by Mr. W. A. Appleton, C.B.E.

THURSDAY, March 9th.

NATIONAL LIBERAL CLUB. POLITICAL AND ECONOMIC CIRCLE.

8 p.m. At Whitehall Place, London, S.W. Lecture on "The Interests of Consumers," by Mr. J. A. Hobson.

FRIDAY, March 10th.

JUNIOR INSTITUTION OF ENGINEERS.

NORTH-EASTERN SECTION.

7 p.m. At Armstrong College, Newcastle. Special meeting. Paper on "Some Impressions of America, with Special Reference to Engineering Practice," by Dr. J. R. Beard.

INSTITUTION OF ELECTRICAL ENGINEERS.

NORTH-WESTERN CENTRE.

7 p.m. At the College of Technology, Manchester. Exhibition of Cinematograph Films, by Dr. C. C. Garrard and Mr. F. Gill, O.B.E.

SCOTTISH CENTRE. STUDENTS' SECTION.

7.30 p.m. At the Royal Technical College, Glasgow. Annual General Meeting and Paper on "Electricity in Mines," by Mr. J. C. Stewart.

IRISH CENTRE.

8 p.m. At the Royal College of Science, Upper Merrion-street, Dublin. Paper on "Wireless Communications in the Campaign in France," by Prof. R. Stanley.

JUNIOR INSTITUTION OF ENGINEERS.

8 p.m. At Caxton Hall, London, S.W. Paper on "Friction," by Mr. C. H. Plant.

ROYAL INSTITUTION.

9 p.m. At Albemarle-street, London, W. Discourse on "Problems in the Variability of Spectra," by Prof. T. R. Merton, F.R.S.

The Editorial, Advertisement and Publishing Offices of "THE ELECTRICIAN" *are at* 8, *Bouverie Street, London, E.C.* 4. *Telegrams: Benbrotric, Fleet, London. Telephone: City* 9852 (5 *lines*).

The subscription to "THE ELECTRICIAN" *is* £1 5 0 *per annum in the United Kingdom and* £1 10 0 *per annum Abroad. Advertisement Rates can be obtained on application to the Manager. Advertisement copy and blocks should be received on the Friday preceding date of publication.*

CONTENTS.

Notes of the Week.

The Electrical Industry and Exhibitions.

In our last issue we gave some reasons why the electrical industry should be represented, not only at exhibitions which are primarily arranged to foster British trade, but at those which are at once of a wider and more limited appeal, in that they attract the general public and allow comparisons to be made between electrical and other methods of doing the same thing. On both these counts the British Industries Fair at Birmingham, which closes to-day, and the Ideal Home Exhibition at Olympia, which remains open until March 25th, may be written down as successes. At each there is an adequate and generally good display of electrical equipment, and at each there is not wanting opportunity of showing that on the scores of attractiveness, reliability and convenience, electrical methods undoubtedly lead. The design of the equipment has been improved and the quality of manufacture is excellent.

Still Room for Improvement.

But the end is not yet. There is room for improvement. For there still persists the idea that the display and sale of the products of individual firms is better than a thoroughly comprehensive exhibit organised by the electrical industry as a whole. We admit that this idea is not wholly wrong. Competition is the soul of business, and the sight of a rival on a neighbouring stand interviewing visitors and booking orders is like a tonic to one's own efforts. But against this must be set the undoubted fact that, especially at a show like the Ideal Home Exhibition, an embarrassment of choice is a disadvantage. The public, eager but uneducated, when shown such a variety of ways of doing the same thing, is first puzzled and then suspicious. The result is that neither individual firms nor the industry profit as they ought. This failure is assisted by the too lavish equipment of the stands. A natural failing, but a failing nevertheless! The result is that even the electrical engineer, who has sufficient knowledge to pick and choose, becomes bewildered. What we should like to see at the next of these exhibitions is a centrally situated electrical stand distinguished by the slogan, if no one can think of a better one, "Electricity in the Home." Perhaps Mr. Beauchamp will arrange.

A Glaring Evil.

But whether this proposal is adopted or not, there is one weakness which should be improved without delay. The cry now is for a "Brighter London." If some of the methods of illumination (!) adopted at the Ideal Home Exhibition continue to be used brightness will be superfluous; for we shall all be blind. The fault is not, we are sorry to say, confined to the non-electrical stands; and, as we indicate in the criticisms which we publish on another page of this issue, something must be done to alter this. It is not inappropriate, therefore, that the subject of debate at the last Salesmanship Conference was "Salesmanship in Relation to Electric Lighting." The debate was opened by Mr. Haydn Harrison, who made the important point for our purpose that "to ensure that electric light produced a bright and pleasant result, it was necessary to do something more than fix a few electric lamps." The endeavour should be, in his opinion, to obtain the same low intrinsic brilliancy which gladdens the eye when looking at the light source, and yet produces that light which tends to make every occupation a pleasure. To obtain this effect not only were suitable shades necessary, but for economic reasons standardisation to some extent was desirable, decorations should be studied, and cheerfulness aimed at. All these are words of wisdom, which we hope will not fall on stony ground.

Industrial Lighting.

In a Paper read before a recent meeting of the Illuminating Engineering Society, Mr. Gaster gave a useful summary of progress towards definite recommendations on industrial lighting. In this country the framing of such

regulations has been the care of the Departmental (Home Office) Committee, which was formed in 1913, and Great Britain may fairly claim to have taken the lead in this matter. Two reports have been issued, in 1915 and last year, and a statutory provision requiring adequate and general lighting has been recommended. Values of illumination requisite in the interests of safety and convenience in factories were suggested in 1915, while the 1921 report contains provisions for avoiding glare. The United States, being for some years little affected by the war, has pushed ahead of us on this road, and there are already seven States which apply "codes" of industrial lighting more elaborate than the proposals in this country, but based on similar principles, though in the latest code issued by the American Illuminating Engineering Society the rules are extremely simple, and the explanations and educational addenda are very full.

Ideal Requirements and Practical Solutions.

Ideal conditions are naturally not always realisable in practice, and, though conditions enabling work to be done with the same ease and safety as in good daylight might be defined in practice, we must be content to devise regulations which will prevent a serious abuse of industrial lighting, without imposing hardship on the manufacturer. We are completely in accord with Mr. Gaster when he emphasises the principle of "government by consent." Interference by authorities is naturally resented by manufacturers; but in view of the educational work that has been done in illumination they will probably readily acquiesce in recommendations made for their own benefit. We understand that the somewhat complex problem of deciding the values of illumination requisite in different industrial processes is to be attacked in co-operation with representatives of the industries concerned. This is a wise step. Although such procedure will naturally take time, it should result in a more scientific and authoritative statement of the necessary lighting conditions than is at present available. It must be remembered that the mere provision of enough light is not the whole problem. The avoidance of glare, and particularly the problem of securing the right *direction* of light for a particular process and the consideration of the nature of the surface illuminated, are equally important. Mr. Gaster paid a tribute to the sympathetic attitude of the Home Office in this matter. We are inclined to think that official action in technical matters would often be more judicious if authorities were to seek expert advice, as has been done in this instance.

The Engineers' Dispute.

At the time of going to press settlement has not been achieved in the Engineers' dispute, trouble still exists in the shipbuilding industry, and at Sheffield the blacksmiths, assisted by the E.T.U., are running a little show of their own. In the first and most important disagreement neither side wants trouble, but neither side wants to give way, and so inevitably we reached the stage we know so well, "when a calamity can only be prevented if the Prime Minister uses his great influence to bring the parties together." Unfortunately the Prime Minister is ill and that hope therefore seems rather illusory. However, the Ministry of Labour has taken the matter in hand, and we understand that conferences between the parties in the disputes are being arranged.

Official and Unofficial Causes.

The official cause of the trouble, as we mentioned last week, is the refusal of the employers to concede their managerial functions on the question of overtime. Here they are undoubtedly in the right, and as the men are conciliatory it seems a little strange that no settlement has been reached. But behind this lies the much more difficult question of the position of the shop stewards, and it is stated to be the intention of the employers to rid themselves of the system which the presence of these men implies. If this really is the issue it would be best to say so, as only by clearly stating the differences between the parties can settlement be reached and disaster averted.

Rental Wiring at Eastbourne.

Though public electricity supply undertakings are now well established concerns, and are daily adding to the number of their consumers, still only a small percentage of the possible demand has been tapped. Of the middle-class houses, small residential property and workmen's dwellings, it is safe to say that not one per cent. enjoys the advantages of electricity supply, partly because of the tenancy agreements and partly because of the inability of the occupiers to bear the cost of the initial installation. Prior to the war many municipal authorities had devised hire purchase or assisted wiring schemes for dealing with this class of property, but when hostilities broke out in 1914 the restrictions imposed soon brought the good work to a standstill. Subsequently the greatly increased demand for power and the heavy cost of wiring and fittings made further progress impossible. Now the prices of materials are falling, and attention is therefore once more being paid to suitable methods for extending the benefits of electricity supply to this class of the community. This is all to the good, and the best method of attack would, we think, be for supply authorities and local wiring contractors to combine to cultivate it properly. In this connection it is interesting to note an experiment now being made by the Eastbourne Corporation.

Details of the Arrangements.

It is significant that the Corporation have made this departure at the instance of the Labour Party, though all the arrangements for wiring and fittings have been prepared by Mr. J. K. Brydges, the borough electrical engineer. At the outset an applicant who desires his house wired must fill up a form of agreement and get his landlord to sign it. The installation, not less than four, nor more than six points, remains the property of the Corporation, and the wiring rental is sevenpence per point per quarter. We are glad to notice that the Corporation have decided not to establish a wiring department, as private enterprise should be capable of dealing with any orders that may come along. Indeed, there are plenty of contractors at Eastbourne to undertake wiring work. Each applicant will be at liberty to select any local contractor for carrying out the work, and when finished the bill will be paid by the Corporation. It is estimated that a six-light installation, inclusive of plain pendants with lamps and opal shades, will cost £9, and as the rental charge would be 15 per cent. upon this figure, the annual rent will be 27s., or 6s. 9d. per quarter, the equivalent of 1s. 1½d. per lamp point. These figures have been modified, but they seem to us still rather high, and we are afraid that the experiment will not be a great success unless there is more flexibility about the arrangements.

Hire-Purchase Arrangements Desirable.

We believe that a hire-purchase, rather than a pure rental scheme, would be less burdensome and be much more

attractive to householders. Experience has shown that when customers are satisfied with an electric light or power experiment they desire to purchase the hired fittings and apparatus. Though the Electricity (Supply) Act does not contemplate this, we think that, perhaps, the Corporation could come to an understanding on the matter with the local contractors. Anyhow, we shall await with interest the results of the Eastbourne experiment.

Electric Lamp Patent Litigation.

Elsewhere we report an important judgment upholding the validity of the patent frequently referred to as the leading-in wire patent. The owners, the British Thomson-Houston Company, have recently been involved in a good deal of patent litigation, and though they have been successful in both the gasfilled lamp and the present case, a great deal of expense must have been incurred, as such proceedings are very costly. The series of episodes, in fact, form a good illustration of the difficulties which beset the path of the inventor, especially the poor inventor who has made a valuable discovery and is himself unable to develop or protect it. Fortunately, in the present case, the plaintiffs are a wealthy company, able to employ counsel and patent experts, and to take all necessary steps to vindicate their rights.

The Points at Issue.

As is well known, for over 30 years platinum was almost exclusively employed as the leading-in wire in vacuum lamps, as its coefficient of expansion was almost equal to that of glass, and it was also non-oxidising. But owing to the high cost of this metal frequent efforts have been made, more particularly since the nineties, to discover a cheaper substitute with similar properties. Though some of the specifications, alleged to be anticipations of the patent, indicate that the inventors were working on somewhat similar lines, though none of them achieved the desired object. In the plaintiffs' patent, which has become a great commercial success, the leading-in wire consists of a core of a nickel-iron alloy with a coating or sheath of copper, which is oxidising, and whose oxide is easily soluble in the glass used in the operation of sealing. In the specification of the patent the alloy consists of 46 per cent. of nickel and 54 per cent. of iron, but in the infringing lamps there was 29 per cent. of copper, about 28·45 per cent. nickel and 42·5 per cent. iron. In the result the Judge held this to be an infringement and granted the usual relief.

Power Companies as Distributors of Electricity.

It will be remembered that the early Power Acts authorised companies to supply electricity in bulk or for power purposes only, the right to supply for lighting and in retail to ordinary consumers being specifically withheld. To overcome this difficulty, several of the power companies, including the North Metropolitan Electric Power Supply Company, formed subsidiary undertakings which obtained provisional orders in towns and districts and took a supply in bulk from the parent Company. Though a fair amount of success has attended this indirect and complicated procedure, it has been costly from the administrative point of view. The North Metropolitan Company has, therefore, introduced a Bill to simplify the position by taking over the seven supply undertakings authorised by the provisional orders held by the North Metropolitan Electrical Power Distribution Company. The whole of the loan and share capital of the latter concern is held by the Power Company and it also supplies all the energy consumed in the seven districts. As far as we can see, the only objection that can be made to this arrangement is that undertakings established under provisional orders can be purchased by the local authorities, who may not wish to lose this right. But in view of the extensive reorganisation of electricity supply which must take place, and especially if a Joint Electricity Authority be formed, this is not likely to be a very valuable privilege.

The North Metropolitan Power Company's Bill.

There is a good deal of indignantly earnest petitioning to the "Lords Spiritual and Temporal" over another clause in the North Metropolitan Company's Bill. This is Clause 15, in which the company desire to reverse a previous prohibition, and to be allowed to supply in the administrative County of London any electricity they purchase from the London & North-Western or the Metropolitan Railways. How, when, or where they are going to do this is the conundrum over which both the London undertakers and the County Council are exercising themselves. Some of them apparently have a vision of the Metropolitan Railway Company forming a "river of electricity" through London, which will be diverted into the premises of private consumers all along the line by the help of the North Metropolitan Company as an intermediary. Some of them also fear that one of their *confrères* is up to no good, since they refer with alarm to the possibility of the North Metropolitan Company obtaining possession of one of the London company's undertakings and performing thereby all kinds of illicit operations. Altogether, most of the petitioners seem to be fighting in the dark, and we suggest that the North Metropolitan might say exactly what they intend doing. For the only section of the population to whom such disputes give unequivocal joy is the legal fraternity, for whose pleasure the poor consumer has ultimately to pay.

A Startling Discovery.

A startling discovery has recently been made, and, like many great discoveries, it has been independently discovered in two different quarters. At the Annual Dinner of the Institution of the Electrical Engineers, Mr. Llewellyn Atkinson included "The Technical Press" among the guests on that occasion, and further reference to this modest and cloistered body were made at the Commemoration meetings and at the lunch of the British Electrical Development Association. Almost simultaneously Mr. Acfield, in his presidential address to the Institution of Railway Signal Engineers, referred to the Technical Press as an educative force. It is not for us to say whether these encomiums are deserved, all we ask is that the Electrical Press should be recognised as part of the electrical industry, and to say that its one aim is the development of the industry of which it is part.

A Ministry of Communications.

That war baby the Ministry of Communications has turned up again. In his recent speech on the Geddes reports the Chancellor of the Exchequer remarked: "There would be much to be said for uniting the Ministry of Transport with the Post Office and having a Ministry of Communications. I do not know whether that recommends itself to anybody." Frankly it does not recommend itself to us. We cannot think of one reason why it would be an advantage, while we can think of several why it would not. We shall not trouble to detail these, as our readers will easily think of them for themselves, but shall simply express the hope that this idea will receive a speedy burial without further waste of time.

The Electricity Supply Bill.

Though the Electricity Supply Bill which was introduced into the House of Lords last week by Viscount Peel is fundamentally the same as the No. 2 Bill of last year, there are certain material omissions and additions. The more contentious clauses of last year's measure have, of course, been abandoned, while additional provisions have been inserted. The Bill, in its present form, is practically permissive throughout, and no compulsion is to be applied to anyone, either company or local authority.

Financial Arrangements.

Unless important parts of the 1919 Act are to remain dead letters some such Bill as the present is, of course, necessary, in order that Joint Electricity Authorities may perform their functions effectively. These dead letters are mainly financial, and it is now proposed to allow a Joint Authority to borrow money for the purchase of generating stations, main transmission lines and permanent works, or for working capital, and to charge the borrowed money on the undertaking and revenues of the Authority. Stock or other securities may be issued in discharge of the purchase price of a generating station or main transmission line acquired from an authorised undertaker provided the latter agrees; and the usual sinking fund arrangements may be suspended in the case of a loan for new works for a period of five years.

Nothing Revolutionary.

There is nothing revolutionary in all this; in fact, many municipal authorities already possess wider powers. As in last year's Bill, there is a provision enabling authorised undertakers within the district of a Joint Authority, as well as consumers and prospective consumers, who obtain a supply of electricity from it, or the Council of any County or Borough to give financial assistance to the Authority by loans, by subscribing for securities, or guaranteeing the interest on loans; but all Councils (except the London County Council) must first obtain the consent of the Ministry of Health before exercising these powers. This precaution is inserted in the interests of economy and as a safeguard for ratepayers.

New Clauses.

Among the new clauses is one enabling the Commissioners to include in a scheme constituting a Joint Authority a provision that those represented on the Authority shall contribute towards its administrative expenses, which seems only fair. There are three fresh clauses dealing with the apportionment of the expenses of the Electricity Commissioners. These enable a revision of the apportionment to be made where necessary, and interest to be charged, if the sum is not paid within two months. Sums due from a Joint Authority or an authorised undertaker can be recovered by the Commissioners summarily as a civil debt. We also notice a small but important extension of Clause 8 relating to the use of transmission lines by agreement. It is probable that colliery, railway, and private company lines are in contemplation, and as the clause is purely permissive no objection can be raised to it.

An Extended Stand-by Clause.

It is proposed to amend Section 15 of the 1909 Act (the "stand-by" clause) and make the expression "premises having a separate supply" include premises "with a separate supply of electricity, gas, steam or other form of energy applicable for the purposes for which electricity is demanded or received." This will enable the Authority to insist upon such a payment for extending the supply cables as will cover the capital charges on the extension in all cases where there is any independent source of power.

Supply from Railway Power Station.

Important amendments have been made in the clause relating to the supply of electricity from a railway or tramway power station to a Joint Authority or authorised undertaker. No such supply is to be given to authorised distributors in the area of a power company or of a Joint Authority without the consent of the latter. This seems to us to be quite equitable and should remove at least one source of opposition from the Bill. The scheme for the revision of prices and methods of charging are practically the same as those in the No. 2 Bill, though the London County Council are now included in the list of those who may make representations on prices and methods of charging. This clause alone, which makes three years the standard period of revision, would be a most welcome and desirable amendment of the existing law. We hope, therefore, that the Bill, now that it has been shorn of practically everything to which exception could reasonably be taken, will be placed on the Statute Book without further delay, in order that the re-organisation of electricity supply, so essential for industrial progress, may proceed on accelerated lines. It was read a second time in the House of Lords on Tuesday.

Interested Opposition.

That being so, we regret to notice that one of the financial journals has declared against the Bill, in ill-informed articles, from a "well-informed correspondent," full of inaccuracies and exaggerations, and calls for its withdrawal. It quotes the late Lord Moulton, a pronounced gas advocate, in support of its attitude, and attempts to scare the public by putting the cost of the transmission lines alone at £150 000 000! In an excess of fury, such as is usually kept for serious matters like football, it holds up the Bill as an attempt to extort money from the pockets of an unwilling public, oblivious of the fact that the public is anxious to invest in electricity supply and does so whenever it gets a chance. It complains that compulsion is still a feature of the Bill. We cannot agree; but even if it were there are people in the electricity supply industry who need compulsion if there is to be any development at all. These arguments may be good enough for the man in the street, but our readers will know that this fantasy is either an emanation from the brain of a director of a gas company or of someone who is not interested in or is even opposed to the progress of electricity supply. Finally the cloven hoof is displayed. Let the present companies go on. We thought so. Now though the companies have not had a fair field their enterprise has not always been what it might. We prefer the J. E. A. idea. For suffice it to say that there exists a large and a steadily increasing demand for electricity, and that this must be met either by the Joint Authorities (or some similar organisation) or by existing supply undertakers. If the latter have to meet their legal obligations the capital expenditure entailed will be greater by millions of pounds than if the Joint Authorities undertake the work, while the financial and economic results will not be nearly so good. Thus there can be no choice of the method that should be adopted, especially as the Company question is mainly confined to London, and it cannot be seriously contended that a particular difficulty should be a basis for general legislation.

Railways and Electrification.

Now that all the British railway companies have held their annual meetings it is interesting to find that, while the speeches naturally dealt with a variety of topics, including amalgamation problems and the great increase in operating costs since 1913, a special point was made of electrification. This is not surprising; for transport charges are one of the principal obstacles to a real revival of trade, and, though grouping will make possible considerable savings, much further effort is necessary if reduced charges are to be realised in the near future. For it is obvious, from the published statistics, that not only have fares passed the economic limit, and that their reduction would be greatly to the companies' advantage as well as to that of trade and industry of the country, but that some means must be taken to overcome congestion. Electrification is that means, especially from the economic point of view.

Electrification Pays.

It is, therefore, gratifying to record that the group of railways controlled by the Underground Company were able to declare higher dividends. The Metropolitan District Company made a payment of one per cent. on its ordinary shares for the first time for 39 years, and the amount carried forward was £40 013 more than in the previous year. Since the line has been worked electrically steady progress has been made year by year and now it would appear as if the shareholders were at last to reap some reward for their directors' foresight and skilful organisation and their own patience. The North London Railway, too, which was in sore straits before it adopted electric traction, now pays 6 per cent. on its consolidated stock, against 5½ per cent. in 1920, and for the first time since 1903 the holders of the preferential consolidated stock receive their maximum rate. Another instance of the combined good effects of electrification and of a progressive policy is the Metropolitan Company, which is able to declare a higher dividend as the result of greatly increased net revenue. In fact, the past year's record of the Company was the best for 15 years, and the prospects are decidedly good.

A Dismal Contrast.

When we turn to the meetings of purely steam railways such as the South-Eastern and Chatham Railway Companies, we find a marked contrast to this dawn of prosperity. This system, more especially the sections within 30 miles of London, is eminently suitable for electric traction and should have been converted years ago. Financial difficulties, coupled with a conservative policy, prevented this being done; though it is just to say that the directors had adopted an electric traction scheme in 1913, but the outbreak of war prevented any real progress being made. Now the chairman, Mr. Cosmo Bonsor, a little inconsistently, complains that the principal asset of the Chatham Company, their short-distance Metropolitan traffic, no longer exists; and that even the company's revenue from outside the Metropolitan area is threatened by an extension of road competition. Truly, an unfortunate position, but wailing will not improve it.

Electric Traction the Only Remedy.

The only effective way to cope with this trouble is to give a better and cheaper service by the introduction of electric traction, and we are pleased to see that probably the companies may be able, by means of the Trades Facilities Act, to do now what should have been done long ago. In order to comply with the provisions of the Act it is proposed to form a "private" construction company, with a capital sufficient to meet preliminary expenses, but with borrowing powers to cover the cost of construction and electrical equipment. The money borrowed will carry the Government guarantee, both as to principal and interest, and will be obtained on the most favourable terms as the work progresses. When complete the works will be let to the Managing Committee on lease for 25 years at a rent sufficient to repay capital and interest at the expiration of the lease, when the works will become the property of the Managing Committee or its successors.

Where Electrification Should Pay.

We have already given particulars of the company's electrification scheme, and we have no doubt that, if it can be carried out, the results will be as satisfactory as in the case of other electrified lines. For though the company's stations are well placed for the distribution of passengers, it cannot run more steam trains in the busy hours, morning and evening, and the only remedy by which increased accommodation for the public and increased revenue can be obtained is, therefore, electrification. The chairman recognises that a change from steam to electric traction would give faster and more frequent services, and would attract those who, owing to overcrowding and inconvenience, now use other means of transport. It would also assist the development of Outer London and so ease the housing difficulty.

The Progressive Brighton Line.

But matters do not end there. The London, Brighton and South Coast Railway is continuing its policy of extending electric working, though it has withdrawn its Bill for additional financial powers. The Great Eastern is another railway that would greatly benefit by adopting electric traction on its suburban lines, and though its ultra-cautious and conservative chairman, Lord Claud Hamilton, made no pronouncement upon the subject, no doubt the force of circumstances and the increasing competition of motor traffic will soon compel it to adopt this form of traction. Other companies are also considering the possibilities and advantages of electric working, and when the amalgamation schemes are out of the way we shall doubtless witness a considerable increase of activity in this connection.

Underground Extensions.

This is the more necessary, for as Lord Ashfield pointed out at the meetings of the "Underground" Electric Railway Companies, improved and extended transport facilities are essential. In the case of the "Underground" a revised scheme has been prepared at the instance of the Government, and, if advantage can be taken of the provisions of the Trade Facilities Act, no doubt it will be carried out. In the case of the City and South London Railway there is urgent need for modern equipment and enlarged tunnels, as anyone who travels on it knows. Last year the traffic declined by more than 9 300 000 passengers, or 23 per cent. There was also a decrease of over 17 millions in the number of passengers carried on the Metropolitan District, of nearly 32 millions on the London Electric Railways, and of nearly 7 millions on the Central London Electric Railway. No doubt the enlargement of the City and South London tunnels, coupled with through running arrangements at Euston, would have very beneficial effects, but we hope that the directors will also bear in mind that a reduction of fares, whenever this is possible, will have an equally good influence on the traffic and revenue of the company.

The Industrial Future in India.

By J. F. CROWLEY, D.Sc., B.A., M.I.E.E.

(*Concluded from page* 225.)

In the second part of his article, though referring to the Indian textile industry, Dr. Crowley deals more generally with labour organisation and its difficulties in that country. Unrest is an important problem, not the least because the native finds it difficult to separate disputes that arise in connection with purely trade matters from political feeling. A good deal of the trouble that has arisen in these disputes would, Dr. Crowley thinks, be minimised if the men were organised into responsible unions and educated by legitimate methods. Details of the development of welfare work and of technical education in India are given, while the importance of rapidly developing the available power on electrical lines is stressed.

Hand Spinning Uneconomic.

As regards hand spinning, which is being strongly advocated by Indian politicians, and an illustration of which is given in Fig. 6, it is a wholly uneconomic proposition, and one that is more likely to lead eventually to distress than to any improvement in the lot of the people. There is no comparison possible, in quantity or quality, between the output of the hand spinning wheel and the modern spinning frame. It might be pointed out here that the counts spun in Indian mills generally vary between 1's and 30's, while the counts used by the native weavers run very much higher, and consist, in most cases, of yarn imported from this country.

There is a definite market for Lancashire goods, and there is reason to believe that, if Lancashire manufacturers

Fig. 6.—Using the Charka or Spinning Wheel in a Mysore Village.

would devote some little attention to encouraging the handloom industry in India by improving the types of loom employed, &c., they would improve the Indian market for their goods.

It is also true, on the other hand, that Indian mills are, in most cases, contemplating extending in the direction of fine spinning, and in course of time would, no doubt, become competitors in this also.

The following extract from a report of Mr. C. R. Palairet, now Director of Industries to the State of Indore, and dealing with his work in the State of Hyderabad, may be of interest in this connection:—

> In spite of the introduction of large spinning and weaving mills, there is, and there probably always will be, room for weaving under cottage conditions. The work lends itself to cottage working, and the low value attached to labour allows of production on lines profitable enough to workers. The industry provides work in this State (Hyderabad, Deccan) for 61 000 persons. Notwithstanding advances in outside places like Sholapur, little or nothing is known here of the fly-shuttle slay; in Hyderabad some weavers are familiar with it, but are too conservative to use it, and cling to the old form of pit loom. The fly-shuttle loom may not be so flexible as the old looms, but could be used, at least, by 75 per cent. of the weavers, who do not have to do work which the fly shuttle cannot do. If unable to handle solid border cloths, it can, at any rate, increase the output in spun cloths threefold without increase in labour. This is the weaver who needs help. Solid border cloth weavers are in competition with themselves only. There is good reason to think that, if proper assistance were given to improving the systems in use among these native craftsmen, and particularly towards improving and simplifying the loom, a great deal of good could be done, particularly in the country districts, and, incidentally, an opening would be maintained for the fine counts of yarn.

With this comment the writer is in complete agreement, and, in his opinion, it applies to many other parts of India besides Hyderabad.

Labour Organisation.

It was estimated that there were fifty million workers in India in 1916. Of this number, farm servants and field labourers formed 52 per cent., handcraftsmen 35 per cent., transport workers 5 per cent., domestic servants 5½ per cent., and factory employees 2 per cent. The growth in factory employees between 1892 and 1919 will be seen from the following table*:—

	1892	1905	1919
Men	254 000	501 000	928 000
Women	44 000	93 000	177 000
Juveniles	19 000	39 000	67 000
Total	317 000	633 000	1 172 000

The organisation of workers in India is still in a very elementary position. The first Trade Union Congress to be held in India was held at Bombay on Oct. 31, 1920, and was attended by representatives of some forty organisations. An office was established at Bombay, and a committee of forty members was appointed, twenty-four of whom had no definite qualifications to represent labour.

Workers' Committees in State Factories

In the latter part of 1920 the Government of India discussed the advisability of establishing Workers' Committees in State factories, and they subsequently established committees in the Government printing offices jointly representative in equal numbers of workers and managers. It has also been reported† that a joint committee has been established as an experiment at the Tata Mills in Bombay.

The tendency towards organisation does not exist only among workers. A meeting of representatives of employers' organisations from all India was held in December, 1920, in Bombay, at which it was decided to form a federation.

Trades Union Movement.

In January, 1921, it was stated that twenty-seven trade unions existed in Madras. These were, however, unregistered, and had no definite constitution. They were not recognised by the employers on the ground that their constitutions were unsatisfactory, and that they were controlled by people outside the Labour movement, who used that movement to serve political ends. The workers, on the other hand, endeavoured to get the unions recognised as they were, on the grounds that they themselves were incapable of conducting them, or of stating their position properly in a dispute. They held, also, that the worker who was a trade union official might be liable to trade victimisation.

In April, 1921, the Government of the Bombay Presidency established a Labour office, (*a*) to compile statistics, and to publish reports on wages, hours, cost of living, strikes, trade unions, and other labour questions, (*b*) to organise a comprehensive labour intelligence service, (*c*) to

* Labour Overseas, Vol. 1, No. 4. March, 1921.

† "The Times of India," Jan. 5, 1921.

advise Government in connection with the settlement of industrial disputes, and (*d*) to advise in connection with the introduction of new and amendment of new legislation. In May, 1921, the Government promised legislation to legalise trade unions, and undertook to encourage their formation. Finally, to complete the twelve months' survey, it should be noted that a movement was started in

Fig. 7.—Warping, Winding, etc., in the Industrial School, Madura.

Bombay for eight unions to form a Central Labour Board on American lines, while a meeting was also held with a view to providing a constitution for a Bengal Federation of Labour.

Unrest.

There is little doubt that the rapid industrial development of India is being seriously delayed by the unsettled political situation there, the frequency with which industrial troubles arise, and the acuteness of these troubles when they do arise. As regards political issues, matters are changing from day to day, and it would scarcely be wise after a visit of something under a year to offer comments or make suggestions regarding matters so complex.

As regards the industrial side, however, some comment seems to be called for. That the situation is not very satisfactory will be gathered from the fact that not fewer than two and a half million working days were lost in the first quarter of 1921 by 185 000 workpeople through strikes or lockouts, fully half of these being in the Province of Bengal.

Unsatisfactory Working Conditions.

The conditions under which the Indian workman lives and works are by no means as satisfactory as they ought to be. On the other hand, there is little doubt that one of the chief troubles with labour in India is that strikes are likely to arise from causes that have really no connection with the ordinary relationships that should exist between employers and employed.

The writer made the suggestion to several responsible people that it would be a very wise step to encourage the formation of reliable and stable trade unions in each and every industry. Many of the employers of labour are opposed to this idea, but there is reason to think that their attitude in this matter has undergone radical alteration. The advantages that should result from the formation of trade unions on proper lines among the workers would be, in the first place, that they would get educated in legitimate trade union methods, and in the part that arbitration and the absence of violence plays in the legitimate settlement of disputes; and, what is of great importance, they would learn to distinguish between matters that properly arise in connection with their employment and have to be adjusted between their employers and themselves, and matters that should really be kept outside the works altogether.

One of the great difficulties in connection with industrial disputes in India is that many of these disputes arise from causes that have no connection with trade union matters.

Recent Trade Disputes.

In connection with recent trade disputes in Bengal, the Director of Industries made the following remarks*:—

> Partly from their non-domicile in the Province, and partly through lack of education, the workmen of Bengal cannot be said to constitute a class, in the sense of a social group, aware of any corporate personality, and they are unpractised in the organisations that make for the common articulation of common desires. The strike as a means of obtaining concessions was not unknown before 1920, but it had appeared only in isolated cases, and the demands had more commonly been non-economic in character.

This summary of the situation in Bengal is applicable to many other areas in India, and the two points put forward, viz., that workmen at present are inexperienced in organisations that make for the articulation of their desires, and that their demands up to recently have been for things properly outside the scope of a trade dispute, form the basis of the contention that the writer puts forward for the thorough organisation of Indian industries on trade union lines, with all the assistance that could be given from experience in more advanced countries.

As has been pointed out, the Government have now taken cognisance of the necessity for such organisation, and legislation has been definitely promised to legalise trade unions and encourage their formation. A notable factor in connection with present trade disputes in India is that the men, through lack of responsible leaders from among themselves, are generally guided by leaders who have no connection with the industry, and to whom, in many cases, notoriety is not unwelcome. On the other hand, there are some notable exceptions to this, and some of those who have taken a leading part in connection with some of the

Fig. 8.—Dyeing in the Open-air, Madura.

industrial disputes have adopted a sound trade union attitude, and one worthy of general emulation in India.

Violent Methods.

As regards the use of violent methods, the following comments in the article just referred to are pertinent:—

> The bulk of strikes have been accompanied by picketing and solidarity has been achieved in individual concerns by methods of intimidation, which have proved, as always, difficult to combat. It

* "Trade Disputes in Bengal," by Director of Industries, Bengal. "Journal of Industries and Labour," Vol. I., Part 1, Feb. 1921.

has been sufficient generally for those most interested in the strike to place anyone who might be recalcitrant under verbal threats of violence to person or property. Actual violence has not been commonly resorted to.

Violence is by no means always absent, however, from strikes in other parts of India, but there is little doubt that greater control would be exercised if the men were organised into responsible unions and educated in legitimate trade union methods.

The suggestion is made that it would be well worth while inviting out to India responsible and experienced trade union leaders with a view to educating and organising the Indian workers on these lines. It is believed that the course proposed would have a stabilising effect on the relationship between employer and employed, and if, in addition, efforts were made to improve the lot of the worker, particularly in his home life, the benefits to industry generally would be very great.

The Development of Welfare Work.

Much has already been done in this connection in Bombay and in Calcutta, where welfare work—as understood in this country—has now been taken up. The Social Service League in Bombay took the initiative in starting the Currimbhoy Ebrahim Workmen's Institute, and the Tata Sons Workmen's Institute, which are carrying on welfare work for the operatives under the agency of these two firms.

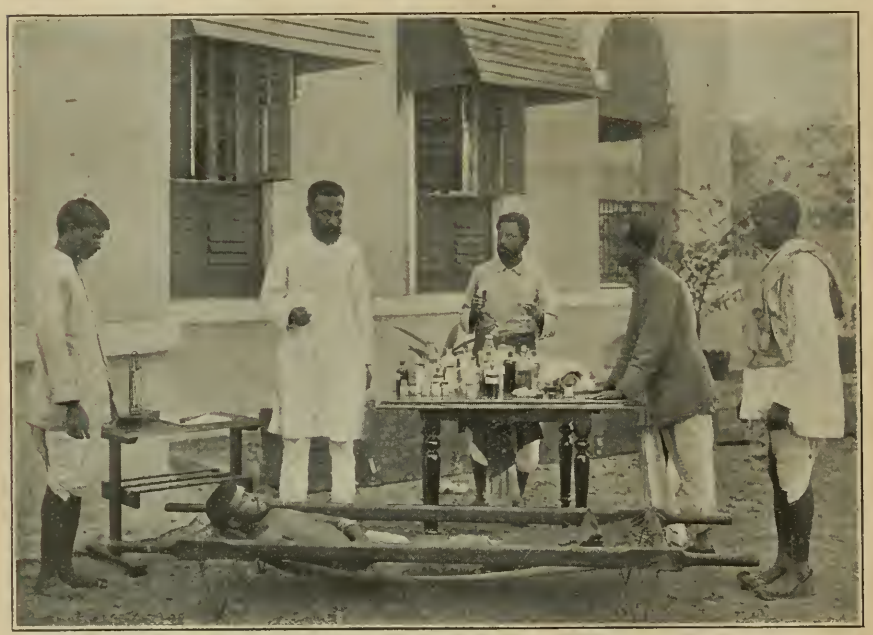

Fig. 9.—Welfare Work in a Calcutta Jute Mill.

Much is also being done in connection with the jute mills in Calcutta, which are really admirably organised concerns, and reflect the greatest credit on those responsible for their control or management.

Fig. 9 shows an illustration of the medical service provided for operatives in a Calcutta jute mill.

As regards maternity benefits and child welfare, India, owing to its special social conditions, was exempted for the time being from compliance with the "draft convention" of the Internationl Labour Conference of the League of Nations. The position of India generally in regard to these matters is not good; in a few cases only is financial assistance given to mothers. The Bombay and Nagpur mills of the Tata Company have established such a system, and also the Sholopur Spinning and Weaving Mills. The whole question is a difficult one, and it is further complicated by the dearth of women doctors.

A notable feature of welfare work, particularly in Bombay, is the establishment of co-operative credit societies, which are formed to enable the worker to be independent of Marwari and Pathan moneylenders, who charge the exorbitant interest on loans of anything from 1 to 4 annas per month per rupee. While it takes some time to educate the workers to new ideas, these societies are already meeting with distinct success.

As regards the work of co-operative societies generally, the following statement* is interesting:—

> The co-operative movement in India made rapid progress in 1919, and its beneficial effects upon the character of the inhabitants are very marked. In the sphere of agriculture . . . much good has been done in helping to reduce debt. . . . In the Madras Presidency, where the movement has advanced considerably, there are at present nearly a quarter of a million members of co-operative societies. . . . The membership of the societies in Bengal rose from 126 000 to 135 000.

Education.

The future of industry depends to a very large extent on the facilities provided for the technical training of the youth of the country. It is not possible, however, in a brief survey of this character, to do anything like justice to the educational position in India.

The Public Works Department provides the greatest number of openings for trained engineers. There are four principal colleges which prepare engineers for this department, viz., Roorkee in the U.P., Madras, Sibpur, and Poona. The training is generally of a civil engineering character, though latterly efforts have been made to develop the teaching of mechanical and electrical engineering. Thus, a Chair of Electrical Engineering was recently founded in Madras. Electrical and mechanical engineering are also taught at the Engineering College, Bangalore, and at an institution which successfully fills a very useful function—the Victoria Technological Institute at Bombay, under the direction of Professor Turner. Higher training in electrical engineering is given at the Indian Institute of Science, Bangalore, established primarily for research under Dr. Fowler and Dr. Alfred Hay, which the writer had an opportunity of visiting. Generally speaking, the training in civil engineering provided in Indian colleges is altogether superior to that provided in mechanical and electrical engineering, largely, no doubt, due to the fact that the principal demand in the public services is for civil engineers. The training in electrical and mechanical engineering is not very satisfactory, and many of the students who wish to take up these courses have at least to complete their education outside the country.

Practical Training.

Education in textile subjects is provided at Serampore, near Calcutta, and in the Victoria Technological Institute at Bombay, and of an elementary character in the trades preparatory schools referred to below.

There are scattered throughout the country in British India, and in Native India, schools of the trades preparatory type, such as the Industrial School at Madura, to which reference has been made.

Universities exist at most of the important centres, as Bombay, Calcutta, Madras, Mysore, &c., and the courses seem to be of a reasonably high standard.

There is apparent throughout India far too great a tendency to regard a degree or a diploma as an end in itself—a marketable label. This attitude naturally lowers the respect in which true education is held, and the respect for knowledge. Notwithstanding this, the Indian student is keen and hardworking, and one found Indian student audiences observant and attentive, and generally differing little from their fellow students in Europe, with whom one would like to see them in closer touch.

* The International Co-operative Bulletin, January, 1921.

As regards the practical side of the training of electrical and mechanical engineering students, it is worthy of note that, owing to the lack of facilities provided by British works, much of this training is given outside the United Kingdom. The result of this is clearly seen on the return of the young engineers to India, when their predilections for material manufactured in the country where they received their training militates very seriously against British trade. This is a matter, however, that could readily be remedied by joint effort between Indian educational authorities and engineering works in this country.

General Impressions.

The writer left India with the feeling that it was a country with a great industrial future, and that while development at the moment was being retarded, partly by unrest and partly by the rate of exchange, great development in the near future was inevitable.

The appointment of Directors of Industry in British India and in native states shows a proper sense of responsibility on the part of Government in these matters. It is noteworthy that the writer found that the directors who had had an engineering or manufacturing training much more successful than those without such training or experience.

It is regrettable that in the application of electricity to industry much of the work carried out is not on the most modern lines, due, no doubt, to the remoteness of the country from the chief engineering centres, and to the absence, in many cases, of highly skilled engineering advice. There is a tendency—on the whole a sound one—more and more to employ Indians in connection with the running of factories and plants, and particularly in all junior positions. As one European of experience in the country put it, " The day of the Chota Sahib in India has ended."

On the other hand there is, and will continue to be, great scope for Europeans in connection with the design and layout of new central power stations, factories, and industrial equipments, and in connection with certain higher technical and administrative appointments, in all of which the longer and greater experience, and the sounder judgment on account of such experience, of Europeans, should be of great value to Indians. Co-operation between the European and Indian on this basis will make for the rapid development of the country, lead to the maintenance of sound feeling and mutual respect between the two peoples, and be of advantage to both.

Reviews.

Absolute Measurements in Electricity and Magnetism. By Andrew Gray, LL.D., F.R.S., M.I.E.E. Second edition. (London: Macmillan & Company, Ltd.) Pp. xix. + 837. Price 42s.

The first edition of Volume I. of this work was printed as long ago as 1888, and the first edition of Volume II. was printed five years ater. Both of these works have played an important part in increasing our knowledge of electricity and consequently in developing the electrical industry. The theorems given clearly explained how it was possible to make very exact electrical measurements. They therefore stimulated further research. The establishment of well-equipped physical laboratories in Europe and America capable of defining and constructing electrical standards has been a great boon to the industry. The consequent easy verification of sub-standards also has been of the greatest value in research work. Prof. Gray's name will always be associated with the early pioneering work in absolute measurements.

To everyone who wants a sound foundation on which to build his theoretical knowledge we can confidently recommend this book. Many of the problems which have to be discussed in electricity need for their solution not only an accurate knowledge of physics, but a thorough knowledge of some of the theorems in higher dynamics. We know no one better equipped with this knowledge than the author. Without it much of the most important work of Kelvin, Maxwell, and Rayleigh cannot be understood. In particular a knowledge of Lagrange's dynamical method is of the greatest value, but the knowledge must be accurate as the method has limitations.

In his preface the author laments the fact that the study of higher dynamics seems to be rapidly dropping out of our University curricula. He comments as follows: " As it is, we have now an army of students and others talking glibly of Einstein and of quantum theory, whose attention to the fundamentals of dynamics and physics has been wofully slight." Many of those who are now trying to understand Einstein's theory would be better employed in trying to understand the more advanced theorems of dynamics.

In bringing this volume up-to-date considerable omissions and additions had to be made. Some of the omissions will be found in the author's treatise on " Magnetism and Electricity," which can be used advantageously as a supplementary volume. Amongst the additions, we note many neat formulæ for the mutual inductance between circular and cylindrical currents. As the radio engineer is always studying problems of this nature, he will find these solutions of immediate practical value. He will also find solutions of the problems of the high-frequency resistance and inductance of cylindrical and strip conductors.

A full description is given of the Gray absolute electrodynamometer and the formula for it is proved. This dynamometer was used by the Bureau of Standards when measuring the electromotive forces of standard cells. The standard historical methods used for the absolute measurement of resistance are described and the limits of accuracy obtainable by the latest methods are given. Chapter XVI. on the comparison of units is of special value. The author points out that the accuracy of R. Shida's result for v, namely, $2{\cdot}955 \times 10^{10}$ cm. per second has been mistakenly called in question. It was a wonderfully accurate result to be obtained by a young Japanese student at Glasgow University forty-one years ago. The mean of the values of v obtained by electrical methods is given as $3{\cdot}0001 \times 10^{10}$ cm. per second. This compares very satisfactorily with the velocity of light, $2{\cdot}9986 \times 10^{10}$ cm. per second, measured experimentally by Perrotin in 1902.

In Chapter XVII. electrostatic measurements are described. We were pleased to notice a description of Snow Harris's electrometer. This was one of the first electrometers ever made, as it dates from about 1834. Few are aware of the high accuracy Snow Harris obtained in his measurements with this instrument. It is well worthy of study. The concluding chapter on the effect of the inductivity of the medium on electric phenomena will be found helpful by students. Beginners always have difficulty in understanding advanced electrostatic theory. The extended use that is now made of high electrical pressures for power transmission makes a knowledge of this theory essential to the engineer. In an Appendix Prof. E. Taylor Jones gives a clear account of a useful working theory of the induction coil.

The standard nomenclature of electricians is practically adopted throughout. This is a great help to the technically trained engineer, as it enables him to understand the theorems much more easily. This work will prove of great value to all electricians who have to leave the beaten track in order to explore the economy and efficiency of new methods. We can congratulate the author on having completed a work which will for many years be a standard book of reference.

ALEXANDER RUSSELL.

A Catalogue of British Scientific and Technical Books. Prepared by a Committee of the British Science Guild. (London: British Science Guild, 6, John-street, Adelphi, W.C. 2.) Pp. xviii. + 376. 10s. net.

To all who have to keep up-to-date in any department of science and learning, this comprehensive catalogue will prove indispensable as a guide to the published volumes that are obtainable on any specific subject. It is at times a sheer impossibility to find a fairly complete list of books on any section of science; this catalogue will help to make the task easier.

The volume contains more than six thousand titles, the classification of which demanded most careful consideration. There are forty-nine main groups, and these are classified into just over 460 sub-classes. For example, Physics and Electrical Engineering are divided into sixteen sub- and twenty sub-headings respectively. Under each sub-heading full details of each book are given—author, full title, size, number of pages, date and number of the last edition, as well as the name of publisher and the present price. Only books that are obtainable through booksellers in the ordinary way are given.

The volume is well printed on a very good tough paper, with a clear type, and the general " get up " is a credit to the printer and the binder; the binding appears to be done for strength, as a work of reference should be.

The Central Office of the INTERNATIONAL ELECTROTECHNICAL COMMISSION informs us that the verbatim report of the Conference on High-Tension Transmission Systems, held in Paris last November, will be published next month in French and in English by the Union des Syndicats de l'Electricité. The price of the report will be 60 fcs. if ordered before April 1, or at least 75 fcs. if ordered after that date. The Union would be glad if those who wish to procure the report would inform M. Tribot Laspierre, general secretary of the Union, Boulevard Malesherbes, 25, Paris, of the number of copies required, specifying whether the copies desired are to be in French or English

THE INSTITUTION JUBILEE COMMEMORATION.

Turbine History—The Boyhood of an Inventor—A Short Way with Legislation—The President on the Commemoration—Early Telephony—The Battle of the Systems.

(*Concluded from page* 257.)

Thursday, February 23.

The Evolution of the Turbine.

After the resolution of congratulation to Mr. Heaviside had been passed, Sir CHARLES PARSONS, who was called upon by the chairman to give his reminiscences, said it was about the year 1884 that he determined to attack the problem of the steam turbine with a very high speed dynamo or alternator directly driven by it. The electrical side involved quite as much work as the turbine, and at that time the data available was very scanty. Little was known quantitatively about hysteresis or eddy current losses, and considerable margins were therefore necessary when designing for periodicities from thirty to fifty times greater than those then in practical use. A speed of 18 000 revs. per min. was chosen, and the estimated output was 10 H.P. To guard against periodicity difficulties a field density one-half that of the Edison machine was aimed at and the E.M.F. was calculated as being directly proportional to the surface speed and the total length of active wire between the ends. The voltage was 100, the length of core 8 in. There were ninety-six conductors of 0·08 in. over the insulation. These were laid on a smooth core composed of thin sheet iron of 0·015 in. thick, which was insulated with paper throughout and threaded on to a hollow steel shaft through which lubricating oil passed for cooling purposes. The end wires were spiralled in two layers and the whole was bound with phosphor bronze wire of 60 tons tensile strength. The commutator had twelve sections with twelve convolutions per section. The current density in the armature at full load was about 9 000 A per sq. in. Thanks to the small radial depth of copper the current was not excessive.

The efficiency of this dynamo was about 80 per cent. and the steam consumption of the plant, about 150 lb. per kWh. This set worked satisfactorily and the only important alterations which had to be made were in the commutator, which was finally constructed of bars in short sections held by dove-tailed steel rings with asbestos insulation which stood up well against the great centrifugal force. The machine worked regularly for some years, and its electrical constants had been re-examined recently and found to agree closely with modern dynamo practice modified to suit the speed of 8 000 revs. per min.

The D.C. Turbo-Generator.

In the four following years about 360 turbines of from 1 kW to 75 kW output were made to similar patterns, these being chiefly used on board ship. From 1885 onwards alterations were made to improve the efficiency of the turbine. The ratio of expansion was increased, the curvature and formation of the blades modified and the velocity of ratio of blade to velocity of steam raised so that in 1888 the consumption of a 32 kW turbine with 90 lb. steam pressure and non-condensing had fallen to 34·5 lb. per kWh.

Early Turbo-Alternators.

The first high-speed alternator driven by a non-condensing turbine was made in 1888. It had a revolving single-phase armature for 75 kW at 4 800 revs. per min. 80 cycles. The armature body was a smooth laminated cylinder and the conductor was wound in a single layer round six longitudinal wooden slabs keyed into the core so as to cover the whole remaining surface, and this after an insulating covering had been applied was bound tightly with piano wire.

It was soon recognised that the efficiency of the turbine could be doubled by using condensers and that the efficiency would increase rapidly with the size at a greater rate than in the reciprocating engine. The first condensing turbo-alternator to be built was for 120 kW in 1891. These machines had a consumption of 27 lb. of steam per kW at 100 lb. steam pressure at 465°F. and 28½ in. vacuum. In 1899 two 1 000 kW turbo-alternators at 4 000 V 1 500 revs. per min. were ordered for Eberfeld. The consumption at full load was 18·25 lb. per kW with steam at 125 lb. and 14°C. of superheat. These were the first turbines to be used in Germany.

Insulation Difficulties.

As sizes and voltages increased it became difficult to secure satisfactory armature insulation and to provide sufficient copper to reduce the heat gradient through the thickness of the insulation. For these reasons since 1903 revolving fields had been adopted. The first revolving field alternator was installed at Neptune Bank, Newcastle-on-Tyne in that year, and was of the salient pole rotor type for 2 000 kW 6 000 V., three-phase, 1 200 revs. per min. 40 cycles. In later years fields of the barrel type had been adopted with the exciting coils sunk in slots and retained in position by dove-tailed keys and the end windings held by caps of bronze or by non-magnetic steel alloy forms which were found to lend themselves more readily to the requirements of the rapidly increasing sizes of alternators which by 1911 had reached 25 000 kW at 750 revs. per min. in the turbo-alternator supplied to the Fisk Street Station of the Commonwealth Edison Company of Chicago. In the construction of these machines the finely stranded type of armature conductor was used which was stranded, insulated and spiralled several times in a conductor length. In this way eddy currents were reduced to a minimum. With the increased outputs at high speeds the cooling by ventilation had become a very important matter, and it had been found that the separately driven fan was in every respect preferable to a fan mounted directly on the rotor, as it more effectually eliminated hot spots. The water cooling of rotors had been satisfactorily carried out, but owing to the increased complication involved it was found better to keep to the usual means of air ventilation.

Ferranti's Boyhood.

Dr. S. Z. DE FERRANTI began by expressing a word of appreciation of the work of Oliver Heaviside, which he described as being of the greatest possible value. Continuing he gave an interesting account of his early mental gropings in the electrical direction. At the time the Institution was holding its first meeting he had not reached the age of eight and took no interest in electrical matters, in spite of the fact that he had slept peacefully when the house he occupied had been struck by lightning. What effect this manifestation might have had on his after work he did not try to estimate, but if his contact with the demonstration had been closer it would have been his last electrical experience. At that time he was exceedingly interested in the steam engine, and Sir Charles Parsons would be amused to know that his first model was a turbine. It was not until he was about eleven years old that he became in any way connected with electricity. In Pepper's "Play Book of Science" he found described an oxy-hydrogen light, and he remembered telling his father that he would like to have an apparatus to make it. When his father said that a much better light was the electric light, he, however, became much more interested in that.

The Magnetic Engine.

Another early idea he had was that of a magnetic engine which should work by the attraction and repulsion of permanent magnets. This involved the insulation of magnetism, and he remembered trying to find out what would insulate magnetism. He conceived brass as being such a material, and an optician in Hatton Garden agreed with him. This was all now quite absurd, but if a permanent magnet working without apparent expenditure of power was conceived it did not seem more ridiculous than obtaining energy from the dissociation of the atom. An early experience of a Siemens dynamo with a two-part commutator gave him more food for thought and he tried to improve the machine, with the result that he evolved one practically identical with that of Paccinotti. The machine worked pretty well, and its sale when he came upon hard times tided him over until he was able to start earning for himself.

Later on he went to University College and had the great advantage of studying under Carey-Foster, Lodge, & Kennedy, but he learned very little from these teachers as he was all the time wanting to get on and do something of a practical nature for himself. In 1881 after two fruitless attempts he succeeded in getting into Siemens' works. Here he was surrounded by dynamos and had the desire of a lifetime satisfied.

Early Arc Lamp Installations.

In those days electric light installations generally consisted of one dynamo supplying one arc lamp. In the City of London there were three systems, that of the Brush Company with a number of sixteen lamps circuits, that of the Maxim Company, which worked in much the same way, and the Siemens installation consisting of a number of masts carrying very big lamps which were each fed from their own dynamos.

What Might Have Been!

Later, Dr. Ferranti continued, he became associated with the Gaulard & Gibbs' high pressure alternating system which in a very short time was supplying 30 000 lamps. He then aimed at lighting the whole of the north side of the Thames, over an area similar to that of the Gas Light & Coke Company, and to secure his position laid mains running from the City in the east to Chelsea in the west, and to the Thames right up to the points adjoining Hamp-

stead. Legislation, however, came along and knocked this scheme on the head.

Here Dr. Ferranti paid a tribute to the devoted men who had worked with him all through the difficult times of starting a high tension electricity supply in London and particularly mentioned Mr. C. P. Sparks, Mr. Vesey Brown, Mr. Arnott, Mr. Colley, Mr Addenbrooke, Mr. R. Wilson, Mr. Partridge, Mr. Wordingham and Mr. Hawtayne. The greatest difficulty in the new work that they undertook at Deptford was not only want of knowledge and experience, but the lack of satisfactory insulating materials. Though they had to build alternators, transformers, switchgear and mains, the only materials available were porcelain and ebonite. Whatever else they needed to complete the system had to be found and adapted, and the gear had to be so designed that they could carry out the results with the only material available. It was hard to think to-day what a handicap that really was, and it was interesting to know that such common things as brown paper and wax candle refuse were used to construct mains which carried 10 000 V and many miles of which after all these years were still giving just as good service as ever.

The Re-flowering of the Institution.

In 1910 Dr. Ferranti continued, he had the great honour of his life, in being elected president of the Institution. He found the Institution somewhat slow and quiet, and inclined to die out or proceed in such a way that he felt its future was uncertain. He saw what a great good the Institution might be and how much it could do for electrical science, and for those who gave their lives to it. He felt that it wanted life and he tried to infuse that life into it. He pleaded, he did everything he could do, he stated his views, but really personally he did nothing, but where he thought he had succeeded was in giving a lead to the presidents who followed him. They really did the work of making the Institution the great society it was to-day.

Early Ship Lighting.

Sir THOMAS CALLENDER said one of his first experiences with electric lighting was when he went to the United States on one of the old Cunard ships which was lighted by oil lamps which had done duty for generations. Coming back he was passenger on the "Cynthia" which if not the first electrically lighted vessel to cross the Atlantic was certainly the first which claimed to have an effective installation. He remembered great crowds of people coming down to the docks to see this wonderful ship, and it was there he first met Mr. J. F. Allbright, associated with Crompton & Company, and in charge of the dynamos. Shortly after that he started his work in connection with electricity. One of the first installations they carried out was the lighting of Buckingham Palace. A great deal of work was also done for the Jablockov Company for Covent Garden and the preliminary lighting of part of the Embankment. Returning from a visit to Russia he came across Jablockov himself in the Customs House, and there began a friendship which lasted for a considerable period.

Main Laying Extraordinary.

The first supply business he undertook in this country was in connection with the Chelsea Electric Supply Company. This was the first real undertaking that had seriously entered into the field of supplying electric light in London on orthodox lines. The difficulties that this company met with were not so much engineering as financial, for even in that rich neighbourhood they could not get any monetary support. In spite of its old-fashioned plant and old-fashioned ways this company was still an independent company waiting, he presumed, to be absorbed in the great scheme which would be brought out for London.

Sir Thomas gave an amusing account of his connection with Mr. Bailey and the Whitehall Court Company when they had run a series of mains about Charing Cross and the Strand without rights, powers, or permission, acting as pirates and pulling up roads. The engineer in charge of the work was discretion itself and he spun yarns which were interesting and fanciful with the result that nobody quite understood what they were doing. It was, of course, necessary to make arrangements with the local governments and obtain certain permissions, but these were given with considerable misgivings. Sir Thomas also described the laying of mains across Waterloo Bridge on a Bank Holiday, a date chosen because the courts were closed, and there was no one to grant an injunction. These mains remained in position for a number of years before the Charing Cross Company regularised their position, and obtained the necessary Provisional Order.

Pioneering Electric Light Work.

Mr. F. BAILEY reviewed Institution history from the year 1883 onwards, remarking on the disappearance of matters relating to the laying and manufacture of submarine cables. He then alluded to the pioneering work of those associated with the Telegraph Construction and Maintenance Company, whom he joined in 1883. This company showed great enterprise in entering the field of electric lighting at a most critical period. An interesting event was the arrangement by the Chairman of the company of a contract for the lighting of the Great Western Railway on the Gordon system. This enterprise had a marked effect on the future of electric lighting.

At this time much difficulty was experienced in dealing with self and mutual induction, matters that were still imperfectly understood. Want of instruments also led to considerable trouble, the Greenwich works of the T. C. & M. Company being compelled to regulate pressure by the aid of a rough photometer in the engine room.

The Paddington engines made by J. and G. Rennie were the last constructed by this firm, and the Willans 3-cylinder engines for driving the exciters at Paddington were the last of this type prior to the introduction of the central valve. The Whitehall station, erected 1887-1888, used the first central valve engine with solid eccentrics on the crank pins.

Some Early Experiences of Mr. Swinburne.

Mr. J. SWINBURNE remarked how strange now appeared the ignorance of forty years ago. There was then an idea that there was some curious problem awaiting solution called "the subdivision of the electric light." Dynamos then were series wound, compound winding unknown and shunt winding a mystery. Each dynamo commonly ran one arc lamp. The problem was how to make it supply a number of small lamps.

Mr. Swinburne recalled a visit to Antwerp and Paris in order to start making Swan lamps. There were no rational text-books, no satisfactory measuring instruments. The best were electro-dynamometers. Voltmeters were obtained eventually, but as the power wasted by the instrument was comparable with that used by a lamp, calculation was necessary to obtain rational results.

Early Carbon Lamps.

The earliest suggestion for carbon filament lamps *in vacuo* was in Belgium in 1836, the subject being a safety lamp for mines. Swan made the first lamp, but Edison realised that lamps must be of high resistance arranged in parallel. Homogeneous cellulose for filaments was due to Weston, who also devised flashing under low pressure. Swan invented squirting. L. S. Powell squirted zinc chloride solution of cotton. C. H. Stearn worked with squirted viscose and with, ultimately, artificial viscose silk—perhaps the first viscose silk ever made.

Mr. Swinburne was inclined to suggest that the giants of old were really pigmies. We had now an industry employing thousands of trained minds and a large number of scientific and business men of exceptional ability. It was therefore exceedingly difficult to rise to the top. But forty years ago things were only at the beginning, and then it was relatively easy to rise.

The Electrical Engineer and Education.

One cause of the different mental equipment of the electrical engineer of to-day was the advance in real education. Matters that were difficult to understand in the early 'eighties were now quite elementary. As an instance Mr. Swinburne recalled the discovery, about 1884, that the product of volts and amperes in an alternating-current circuit was not necessarily the watts. On one occasion, at Brighton, when an alternator was on an inductive circuit, they found the indicator diagram smaller than the apparent watts indicated. "Someone told one of the esteemed past-presidents of this. He regarded his informant severely, but thoughtfully, and said, 'You're a liar.'"

In conclusion, Mr. Swinburne mentioned that the electrical and engineering papers, not to speak of the Institution, did much to remedy the poverty of good text-books. THE ELECTRICIAN and "The Electrical Review" had both done splendid work in this direction.

A Letter From the President.

At Thursday evening's meeting Mr. A. A. CAMPBELL SWINTON presided, and opened the proceedings by reading a letter from the PRESIDENT, expressing his great disappointment at being unable to preside over the Commemoration. He thanked Mr. Swinton, and the other vice-Presidents and his many kind colleagues for the special efforts they had made to take over his job. The Commemoration meetings were devised to serve manifold ends. Just as there was only one really true and just reason for drinking wine—that was because one liked it, it was the first end of these meetings to give pleasure by meeting old friends and hearing them recall past days, with their failures, trials, and at length, successes. In short, the noble pleasure of hero-worship. Again to realise the supreme pleasure of visualising the still growing enterprise that had emerged from fifty years of work—team work carried out often by men who did not at the time realise that they were on the same job, in fact opposing one another in every way, and now finding they were really working to the same end.

The second object of these meetings was to produce a living history of electrical engineering in all its applications, and to preserve this history by producing a special number of the "Journal

containing the contributions, spoken and written. The history of electrical engineering began with Volta's discovery of the primary battery, and Oersted's moving compass needle. Faraday's discoveries provided means of converting mechanical into electrical energy, and to preserve its value, as the development of these primary discoveries proceeded, measurement of quantities and constants became necessary, and from the work of Kelvin, Maxwell, Rayleigh, Joule, Carey-Foster, Wheatstone, Bright, Latimer Clark, and many others from about 1850 to 1870, arose not only the system of electrical units now in international use, but also knowledge leading to the better understanding of heat and its applications.

A Cyclic Advance.

It was interesting to trace the many instances where a notable advance in one device led to advancement in unexpected directions. In 1775, Watt's steam-engine patent was renewed in the same year that Arkwright patented his invention of the cotton-spinning mill. The steam-engine made possible the large mill, and the mill led to the development of the steam engine. The development of the electric generator produced the high-speed steam-engine, and later the work of Parsons in building the steam turbine led to the so-called super-power station of to-day. The alternator and turbine developed side by side, the one depending on the other. There would be no use ashore for the large turbine apart from electricity supply.

Dr. Fleming's Co-operation.

They were truly fortunate when Dr. Fleming threw himself so heartily into the spirit of the Council's Commemoration Scheme. They owed him a great debt. He had made clear the foundations of electrical engineering. The last fifty years of its history was in fact the history of their Institution. It started with a trifling apparatus used with delicate skill, and a growing army of keen men pursued the new idea, ever broadening its application, bringing in their train armies of skilled assistants and craftsmen, who during fifty years had built up the latest enterprise of to-day. The foundations laid by a master mind turned strength and security to kinetic energy. They held the principle of light, which was the principle of growth. That was the precious heritage they must preserve, and it could be preserved only in an atmosphere where freedom of growth was possible. Legislation had hampered their freedom, and he hoped the record of their meetings might serve to spread a wider knowledge of the history of electrical engineering, so that future legislation might be guided by wiser hands.

Thanks to the Press.

Mr. Campbell Swinton, on behalf of the Council thanked Messrs. A. H. Allen, F. H. Masters, E. Slater and A. G. Whyte for the invaluable work they had done in condensing for Press purposes the remarks of the various contributors of the discourses at those meetings. The Council also thanked the daily Press for the large amount of space they had devoted to the meetings.

The Inception of Telephony.

Mr. J. E. Kingsbury remarked that it was something of a coincidence that the year they were celebrating, 1872, saw the origin of Bell's experiments. His own first experience of telephonic speech was in 1878, through the Edison carbon transmitter, which gave more powerful effects than the early magneto form. It was almost impossible to convey to those who had always been familiar with the telephone, the feeling of awe that was excited by first hearing human speech by this means. Public demonstrations of the telephone in those days were always interesting and sometimes exciting. At the first demonstration of Edison's loud-speaking receiver it broke down completely. He (Mr. Kingsbury) admired the coolness with which Edison's nephew took the instrument to pieces and replaced it while an excited crowd of scientists were waiting at the door for admission.

It was really as exchange organisations that the Bell and Edison companies started. Existing telegraph lines were mostly along roads and railways. New methods of carrying increasing numbers of wires had to be developed. Pioneers in England had no statutory powers, and depended on permission from private persons to fix their fittings. The switching system was a new and most difficult thing to evolve.

The Difficulties of Adaptation.

It was less difficult to create something new in itself than to adapt the new to work with the old. Yet this must be done in all telephonic advances, otherwise there would have to be immediate duplication or cessation of service. Let it be recalled that in 1878 the telephone was first used in exchange service. To-day there were about 21 million telephones connected to various exchanges throughout the world. In 1877 Bell aimed at conveying speech "through instruments not more than twenty miles apart." To-day conversation had been accomplished over 5 000 miles. America was spanned from East to West more than seven years ago. Given commercial conditions to justify it, the Continent could be equally well spanned from north to south. Scientifically, an Indo-European telephone was possible, though it might not be a commercial probability. Yet conversation between London and Constantinople was by no means an idle dream.

Telephone Legislation.

In the latter part of his address Mr. Kingsbury dealt with legislation, remarking on the narrow view originally conceived. More regard should have been paid to what the nation might gain by improved communication as a set off against a possibly reduced revenue from telegraphs. The artificial difficulties that impeded early growth have had far reaching consequences. It was useless decrying legislation which was not spontaneous, but represented roughly the public opinion of the moment. So far as the telephone was concerned the period of divided interests was over. There was doubtless leeway to be made up, but much criticism was ill-informed. Broader views were needed all round, and not the least among the critical subscribers.

Early Experiences of Electricity Supply.

Mr. G. W. Partridge mentioned that with the Brush series arc lighting system pressures up to 3 000 V were used, and the fact that so few people were injured could only be explained by the awe with which electricity was regarded. The Earl of Crawford, on his return from the Paris Exhibition, decided, in conjunction with Sir Coutts Lindsay, to install a portable plant in a yard behind the Grosvenor Gallery. The go and return a.c. mains were run side by side to obviate induction effects. Mr. Ferranti afterwards introduced the parallel system of transformers and reconstructed the generating plant. Power was conveyed to the neighbourhood by an overhead system of mains. The London Electric Supply Corporation was formed in 1887, and the Deptford station started soon afterwards. The a.c. system was looked upon with much dislike and suspicion. There were numerous accidents, and ultimately the whole installation was shut down in order that underground mains might be substituted. During the period of shut down (four months) the consumers had no electric light. Meantime the rival d.c. companies were busy connecting up their consumers. Trouble was experienced from interference with the telephone circuits, and newspapers commented upon the "mysterious magnetic storms" which affected the telephones not only in London, but in Paris.

Legislative Difficulties.

Mr. Partridge gave a list of improvements in a.c. work that followed, and remarked that work was very well executed in spite of the limited knowledge of electric phenomena. Under Dr. Ferranti's guidance much ingenuity was shown in overcoming difficulties, and the directors personally found large sums of money to perfect and carry on the work.

Many difficulties were due to legislation, and it had always seemed remarkable that electricity supply should be treated so differently from water, gas, railways and other public service undertakings. Association or actual electrical connection between different companies was forbidden by law, so it was not surprising that each company adopted whatever system it thought best. It was not until the 1908 Act that companies were empowered to assist one another and to supply railways. The troubles during the twenty years prior to this had had a most serious effect on electrical developments. His own company in 1906 risked its capital to install the plant for supply to the Brighton railways, though it had no legal power to undertake this supply.

Considering the extraordinary pioneering work carried out by London supply companies it seemed a great hardship that this country had not benefited more from these efforts. The future was still uncertain, and the industry had still to release itself from the stranglehold perpetrated by the legislative errors of forty years ago.

In the Land of Don Quixote.

Mr. M. Bernard Drake recalled his experience of the installation of electric light in Spain, where he was arrested as a smuggler on the ground that the coil of "rope" he carried contained hidden copper. Eventually he was able to show the first arc lamp in Madrid. On one occasion a shortage of cables was made good by iron hurdles suspended from trees—this was regarded by German engineers at work in the city as an essential part of the Brush system and caused them much puzzling. The next event was a dispute with a Spaniard who wished to take over the working. In order to prevent interference Mr. Drake pocketed a brush, which again led to arrest for theft and a challenge to a duel.

On his return to England Mr. Drake was responsible for the lighting of the railway stations at Bristol and Cardiff. The next step was an appointment as managing engineer of the Electrical Power Storage Company, when the batteries did not last well. Many of the later improvements in batteries such as the use of wood separators, were, however, tried in these early days. The

long life now obtained was due as much to increased knowledge of use as improvements in the plates themselves. Until some entirely new departure was made not very much more could be expected from lead batteries, said Mr. Drake.

Fifty Years of the Electric Telegraph.

Sir William Noble, in his address on the "Electric Telegraph," recalled that several distinct telegraph companies were in operation up till 1870, when they were taken over by the Government. Subsequent developments had been rapid showing that a State monopoly does not necessarily retard advances. Efforts were soon made to attain uniformity in apparatus, and the single needle was displaced by the sounder on all important circuits.

Methods were adopted to improve the carrying capacity of lines. Duplex working, invented by Gintl in 1853, was introduced by the Post Office in 1873; quadruplex working, independently devised by Heaviside in 1873 and Edison in 1874, came into use soon after 1876. Post Office engineers had eliminated many radical defects in all these methods, and had practically evolved a new system.

Another outstanding invention, the Wheatstone automatic system, was likewise developed and improved. Other advances included improvements in methods of repeating signals and refinements in balancing duplex circuits. In 1919 676 Wheatstone automatic sets were in use by the Post Office.

Printing Telegraphy.

The Hughes Printing Telegraph was used in the British Post Office in 1889, and has been much improved. Multiplex telegraphy had revolutionised telegraph practice. In 1886 it was used as a single current system, but two P.O. engineers, J. Chapman and R. Hendrie, enabled it to work double current, and later on S. A. Pollack, also a P.O. engineer, applied diplex, either operators working simultaneously, four in each direction. The adoption of a five-unit code in place of the Morse "dot and dash" enabled multiplex to be used on circuits of much lower line speed; this was substantially the Baudot system developed in France and successfully duplexed in by A. C. Booth in 1905, with most important results. The twelve-channel set working on one circuit between London and Birmingham had carried more than 8 000 messages in a day of twelve working hours. Yet another outstanding achievement was the design of the multiple intercommunication switch by T. F. Purves, adopted in London in 1902, which greatly expedited the transmission of telegrams within the London area.

It had always been the practice of the Post Office, concluded Sir William, to encourage inventors. The Creed, and Murray apparatus illustrate the success of this policy. Important work had been done in recent years in improving primary batteries, and their displacement by secondary cells in large offices. The British Post Office had always been pre-eminent in methods of line-construction, and underground construction had also made rapid progress.

Early Electricity Supply in Brighton.

Mr. A. Wright's communication consisted of an interesting chronological survey of electricity supply in Brighton up to the year 1889. An exhibition of Brush arc lighting was given in 1881, and Robert Hammond was persuaded to leave the plant there for experiment. Finally a few enthusiastic consumers were found who were willing to pay 12s. per week per arc lamp, and permanent supply commenced in 1882, when sixteen lamps were contracted for. In 1883 business increased, and a tariff of 6s. per arc lamp per week and 1s. 6d. for each carbon consumer was fixed. This meterless tariff attracted consumers. In 1884 a method of metering combined arc and incandescent lamps was devised, and by the end of the year the Brighton Electric Light Company was formed. The result of the first year's trading was a 4 per cent. dividend on a capital of £7 240 and the supply to forty customers taking twenty-seven arcs and 874 incandescents. In 1885 a tariff of 1s. to 1s. 4d. per unit, under specified conditions, was adopted. By 1888 the constant current system was replaced by the more elastic a.c. system with transformers.

Early in 1889 Mr. Wright severed his connection with the Brighton Company and joined Mr. Ferranti's staff in London. Early developments at Brighton were fully described by the late Mr. Snell in the twentieth volume of The Electrician in 1887.

The Work of John Hopkinson.

Mr. C. H. Wordingham said that he was articled to Dr. Hopkinson in 1885, but that great man had earlier aroused his interest by the prediction that a.c. machines would work in parallel. This was verified by Prof. Grylls Adams at the South Foreland with some lighthouse machines, on the occasion of some tests of the relative merits of gas, oil, and electric light for lighthouse purposes. Dr. Hopkinson was responsible for several epoch-making Papers, notably that written with his brother on dynamo electric machinery, and that delivered as his inaugural address to the Junior Institution of Engineers (1895), on the principles governing the cost of production and methods of charging for electricity.

The Battle of the Systems.

Mr. Wordingham also assisted Hopkinson in his work on the Manchester and Whitehaven generating stations, schemes which deserved great credit for their boldness. For by the three-wire system he was able to attain nearly all the advantages of the higher pressure which the 200 V lamp afterwards made possible. The Manchester and Whitehaven systems were the first to have the middle wire of a multiple wire network connected solidly to earth. This doubtless caused most of the early troubles with these mains, owing to the maintenance of a pressure of 200 V. between negative and earth, which forced the current through the dielectric. In those days the "battle of the systems" was in full swing. It was hardly credible that the generators at Manchester, the largest of which was of 240 kW capacity, were looked upon as tremendous machines and referred to as "Jumbos."

Meter Difficulties.

Mr. Wordingham also recalled the introduction of meters on the system of the London Electric Supply Corporation. At that time, 1889, Ferranti was the presiding genius. The results of the introduction of meters were remarkable. Some consumers found their consumption reduced to a third while others were troubled by an increase, leading to stormy interviews. Recollection of those days raised doubts of the merits of contract rates per lamp and other panacea for producing revenue. "There is only one true system of charging and Hopkinson is its prophet," said Mr. Wordingham. In conclusion the speaker paid a tribute to Dr. Hopkinson as an educationist. His mind was so clear and everything he did so directly to the point, and he was always equable and reasonable. High as his reputation was much more would be said about him if the full extent of his work and inventive genius were more widely known.

Mr. Atkinson's Summing Up.

Mr. Atkinson said that the President had asked him to say a few words at the close of the meetings by way of summing up. There was no doubt that the meetings had been a great success, that the audience had been carried into another age, but an age so near to our own, that many of those who had worked in it were still taking an active part. It was well that on the fiftieth anniversary of their first meeting they should collect and visualise a little of the past age because he believed that they were now at the beginning of another age, a tremendous era when the use of the atom and its energy would probably replace all the generating appliances they had been considering.

Mr. Atkinson recalled a few of those who were of this age, but also had gone, including Thomas Parker, who he believed was in turn ironmonger, travelling showman, mesmerist, and then electrician, Hughes, whose name had been mentioned in connection with the electric telegraph, and Ayrton, who was a great man in spite of the idiosyncrasy that he claimed every invention under development as a child of his own or Perry's.

The Ignorance of the Early Workers.

During these meetings it had come to him with great clearness how tremendously ignorant the early workers were and what difficulties they had had to overcome. In Crompton, Kennedy, Raworth, and Kapp they had examples of well-trained expert engineers who had had to begin to learn electrical science in the middle of their professional and commercial life. Then there were Hopkinson, Forbes, Oliver Lodge, Silvanus Thompson, men of university training, knowing the mathematical side, but with little of that practical knowledge of engineering which proceeded from actual contact with things. A third type such as Ferranti, Mordey, and Ravenshaw trained themselves and a great many others.

Three Different Languages.

In the electrical world in these days they had three different languages. In a lecture at the Institution of Civil Engineers, Hopkinson had treated the equation of the motion of two parallel connected alternators as an equation of the motion of two moving bodies with a certain force between them. He proved by equations that the motion was suitable, and therefore they would run in parallel; but nobody believed him. When Kapp gave a Paper at the Institution of Electrical Engineers on transformers, George Forbes jumped up and put a few differential equations on the board which he said gave the whole theory of transformers, but he was speaking a language that transformer makers did not understand or believe in. Blakesley showed by graphic vector algebra what took place in alternating current circuits, but it was beyond the practitioners; besides, the alternator did not give the required sine wave. He laid stress on these matters because they explained to his mind many of the difficulties that had arisen. As Col. Crompton had said, those were joyous days. An experimentally discovered fact would always give more pleasure than a deduction from theory.

This concluded a most successful Commemoration.

The Home Idealised.

No doubt many electrical engineers, either in their official or domestic capacities, will visit the IDEAL HOME EXHIBITION which opened at Olympia on Wednesday of last week, and remains open until Saturday, March 25. If up to the present they have not arranged to do so they should change their minds, for there is on view a good deal which is of real electrical interest, of educational value and of suggestion for future action.

The Householders' Aim and Object.

This exhibition, indeed, is not as other exhibitions. Its appeal is general rather than specialised, particularly in these days of housing problems. For everyone has to have a home of some sort, and everyone can, therefore, visit Olympia with advantage and obtain hints how their present methods of living and house equipment may be improved. Incidentally, they may learn a little what to avoid. The present aim and object of every householder, and particularly of every householder's wife, are to discover and install labour-saving appliances which shall reduce to a minimum the work which is of the most tedious kind, because it has ever to be repeated and never leads to any tangible results. From this point of view the exhibition is an education, and the only reasons which prevent our homes being bettered on the lines suggested by various exhibitors are the infinity of choice of method, an innate conservatism and the high prices that must be paid before the goal can be reached.

Solely from the electrical point of view the exhibition does not display anything that is startlingly novel. At one end of the scale there is a wide assortment of small country-house lighting plants, which their manufacturers assure us are better designed and more economical than anything else of the kind on the market, but the cynically-minded have heard that before, and turn away with the reflection that, if the plutocrat wishes to light his house electrically—and, of course, all plutocrats do—he has ample choice of many sorts of equipment which do not really differ very much from each other either in price or efficiency. It is with the middle class that we, as electrical engineers, should be mainly concerned. There lies the demand and there lies our strength.

Help for the Middle Classes.

In the more purely domestic section, i.e., on the stands where heating and cooking apparatus are shown, the same tale holds good. There is little of novelty, but much of interest. For electric cooking and heating apparatus is becoming at once a more engineering job and a piece of apparatus which can be safely entrusted to ordinary domestic hands. This is not a paradox; but an eternal verity. On these stands also there may be found a large variety of approaches towards the same end, though designs differ both in scope and in detail, for while there are some who worship at the shrine of solidity, others believe in the goddess of cheapness. Generally, however, the apparatus on view is much more capable of its work than it was only two years ago, and there is also a pleasing recognition on the manufacturer's part of the fact that price has been in the past a real obstacle to electrical development.

Out-of-Date Illumination Methods.

We first visited the exhibition at a time when it was comparatively empty, and took the opportunity of visualising generally the various exhibits so as to try and discover tendencies. A large majority of the stands are not, of course, officially of electrical interest, but as all of them, except those which are occupied by the gas industry, are electrically lighted, a few remarks on the systems of illumination adopted may not be out of place. Primarily it is interesting to note that the aisles of the exhibition are still lighted by arc lamps of an antiquarian pattern. This, of course, has nothing to do with the exhibition organisers, but must be laid entirely at the doors of those who own Olympia. On most of the stands, as might be expected, gasfilled lamps are prominent, and, though these are generally properly shaded there are a few glaring instances to the contrary, and it is regrettable to notice that electrical firms are among the sinners. What can be said of the man who illuminates (save the mark) his stand with gasfilled lamps protected by no shades whatsoever, and so arranged that anyone approaching down a neighbouring aisle receives the light from the unshaded filaments like a whip-lash across his face? Almost worse, if that is possible, is the man who "protects" his gasfilled lamps by plain shades as exiguous as a ballet dancer's skirt, and who places these lamps so low that they are really an interference with those who wish to see what he is exhibiting and with those who rent neighbouring stands.

Illumination as it should be.

These criticisms are necessarily severe, but we do not thereby wish to detract from the excellent lighting schemes which are to be found on a number of the stands, mostly the electrical ones. Interesting, as being novel, is the free use made of neon lamps for sign purposes, and the schemes in which these lamps are employed are often very well worked out. There are bowl fittings innumerable, most of them excellent from the illumination point of view, and many of them of high artistry in both design and execution. In some cases, however, the illumination of the more decorative stands occupied by furnishing and other similar firms is too low, and is therefore hardly calculated to show the exhibits up in the way they should be shown up. This is a matter which, in these modern days, the furnishing trades might take up with advantage for good illumination is most necessary for the adequate display of their goods.

Royal Gardens and Daylight Illumination.

Excellent use has, we are glad to see, been made of modern illumination methods in the ten gardens which have been designed by various Royal ladies. These gardens, which occupy the annexe, are illuminated by a special lighting scheme consisting of Mazda gasfilled lamps and CHANCE BROTHERS' colour-matching glass.

The installation was designed by the BRITISH THOMSON-HOUSTON Co.'s illuminating engineers to illuminate the model gardens in such a way as to obtain a permanent sunlight effect, and to preserve the natural colours of the flowers. These objects have been successfully achieved, and it may be claimed with justice that the installation represents an important advance in the production of artificial daylight on a large scale.

The equipment consists of 60 concentrating type Mazdalux reflectors, fitted with Chance's sunlight glass rectifying screens, and each reflector contains a 1 000 W Mazda gasfilled lamp. These units are suspended at a height of 20 ft., so that the bottoms of the reflectors project just below the azure blue muslin-ceiling, which forms the "sky" of the annexe.

Turning to the more purely electrical exhibits this year as the exhibition organisers have discarded the use of model houses which were so prominent a feature of the exhibition two years ago, many electrical firms have been prevented from showing their domestic apparatus in a wholesale fashion. Nevertheless the same end has generally been arrived at in different ways.

Nine Years' Specialisation.

A firm who have been specialising for no less than nine years in the manufacture of electric fires and cooking appliances are BELLING AND COMPANY. The latest outcome of all this concentrated work is a 2 kW fire which we illustrate herewith (Fig. 1).

This consists of a small dog grate with electric fire bars well to the front, the top of the fire being cleverly shaped and coloured to represent glowing embers. But this is a delusion, for the top is really illuminated by suitable lamps in the body of the fire, the light being thrown upwards and downwards by aluminium reflectors. The effect is cheerful, more psychology! In this fire Belling's

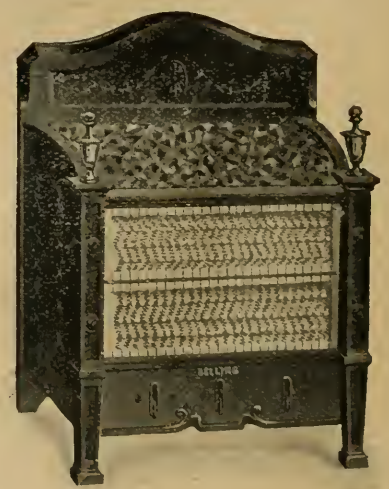

FIG. 1.—THE BELLING "IMITATION COAL" FIRE.

new multi-parabolic bar is employed. This consists of the usual base of vitreous material, which is given a fixed curvature and the face of which consists of a large number of wells of parabolic shape, in which the wire is seated at the correct focus. This arrangement, it is claimed, is very efficient, as the curved formation results in the heat being well distributed throughout the room.

Switches for the Lazy.

As will be noted from the illustration, three switches are provided, one for the lamps and two for controlling the heater. These, which are so arranged that they can be worked by the foot, are of

the MK pattern, giving a free and positive make and break. They are so designed that no lateral motion of the switch handle is possible even if the foot be placed not quite centrally upon the handle, or if the handle be kicked rather than pressed. In construction these switches, which are of the double-bladed knife type, are very robust, and mica has been largely relied upon for insulation. We are interested to learn that Belling & Co. are adopting this switch as standard throughout their fires, not only for the sake of solidity, but to simplify the connections.

Another interesting fire is shown in Fig. 2 This is a combined radiator and air warmer, the volume of circulating warm air passing

Fig. 2.—The Imperial Fire.

behind the bars being controlled by a regulator. The design of frame also conforms to the latest parabolic principle for throwing the heat forward, and in addition the fire is fitted with foot switches described above, and with a trivet which can be placed either above or below the bars.

Among the cooking apparatus on this stand we noticed a three-heat griller and boiler with a loading of 1 200 W and fitted with a three-heat switch. This griller has a range of rings so that utensils of various sizes may be used. Accessory to it is a sheet body fitted with a top element so that roasting, grilling and boiling can be carried on at the same time at a low cost from a combined apparatus. Needless to say the " Modernette " cooker is in evidence and is now fitted with a hinged top and with a double-grill which can be turned into a boiler by the employment of a reflector plate. The enamel drip tray at the bottom of the cooker collects all the fat which drops right through the element. As before, a most useful accessory is the plate warmer chamber which is fitted at the side.

Sturdy Switches.

Also to be found on this stand are a selection of MK plugs and sockets, noticeable among which is the combined foolproof switch and plug and the D.P. main switch for small houses. This exhibit is really an offshoot of Belling & Co.'s new showrooms at 18, Berners Street, and we are interested to learn that all business done at the exhibition will be executed through contractors in the purchaser's district.

Jackson Junior Joys.

If anyone says Jackson, we all think of cooking. This time we are not far wrong, for the Jackson Electric Stove Company are showing an example of their well-known No. 21 cooker, in which the hot plates are fitted with open elements. They are also displaying a number of electric heating, cooking, and labour-saving devices whose details are so familiar to readers of The Electrician that we need say no more. We, however, did note a 750 W electric fire designed for hanging on the wall, and specially intended for use on board ship or in nurseries, where a certain amount of foolproofedness and untouchableness are desirable qualities. One of the pieces of apparatus on this stand which should cause the greatest attention among " small house " wives is the No. 19 cooker, which consists of two hot plates and an oven, and which in spite of its diminutive size will, we are assured, cook a full size dinner for four full-sized people. No more worrying about whether the fire will burn or burn too well and carbonise the joint! A display of irons, combined grills, and boilers and enamelled iron fires at very moderate prices, should send the anxious housewife away envious and determined to use nothing but electricity in her ideal home.

(To be continued.)

Correspondence.

ELECTRICAL versus MECHANICAL ENGINEERS.

To the Editor of THE ELECTRICIAN.

Sir,—"Nabia's" letter in your issue of February 17 cannot be allowed to go by default as a verdict against the electrical engineer's independence.

His letter is balanced and judicious, and I have considered carefully in consequence the probable reasons for his conclusions. The first reason is, I think, what he himself states: that he has "no special knowledge of railway administration," but it is not so much, I think, the want of knowledge of railway administration as the want of conception of the size of railways, the action of which has given rise to this correspondence.

In a small firm, and possibly in a small railway, the work of the different engineering branches is not of sufficient size to warrant a special independent sectional engineer. This is a disadvantage to the small railways, as they fail to gain the advantages of the imagination and initiative of each engineer, which qualities are only properly fostered and used to the gain of the company if the officer is independent of any control except that of "policy" control; in fact, that of the general manager in the case of a railway.

There are at least ten railways in England large enough to enjoy the great advantages not only of independent civil engineer and independent mechanical engineer, but of an independent electrical engineer.

The argument applies to all three sections of engineering, but it applies with greater force to the electrical side, as modern developments have been and will continue to be almost entirely developments accomplished by electrical means, requiring an electrical engineering knowledge and imagination of a very high order. That such high imaginative work will not be carried out except with an absence of other engineering control I regard as a law of human nature, and am quite prepared to verify it from actual experience.

There can never be a strict line drawn between any of the sections of engineering, and certainly not between electrical and mechanical engineering, but no difficulty should be experienced by a first-class commercial man, having directly under him three independent engineers (one for civil, one for mechanical, and one for electrical work), in apportioning their activities so that each could be doing the work for which he had been mostly trained and for which his imagination best suited him; the work therefore for which he would give the best results to his company. I am, &c.,

"Railwayman."

["Railwayman" asks us to state that he is not accustomed to being anonymous, but that under the circumstances it is inevitable.—Ed. E.]

THE "REVO" ELECTRIC IRON.

To the Editor of THE ELECTRICIAN.

Sir,—We note your correspondent's further letter with reference to the above. He now says there is nothing wonderful in the performance, although he stated in his previous letter that the result was impossible of achievement and by calculation proved this to his own satisfaction; that his calculation was incorrect as well as his statement does not apparently matter. His main idea appears to be to belittle the result somehow; that your correspondent did not make sure of his ground is his own fault, and "the nigger" he has discovered is, to use another simile, "his own baby."

Your correspondent made the mistake of assuming that the electric iron overloaded 150 per cent. would be left on circuit continuously even when too hot to use for ironing, knowing full well that it is one of the easiest things imaginable to disconnect an iron from the supply.

We submit also that it is not fitting for Mr. Scourfield to complain that we are not precise and then deliberately to misquote from our letter. We certainly did *not* say that an electric iron "is never in use continuously *during ironing operations.*"

Your correspondent says that "if an electric iron is to be switched off every few minutes to prevent overheating and burning of the material, ironing under these conditions would become not only laborious, but extremely dangerous," certainly, but is not the user who puts 100 V appliances on 200 V circuit "asking for trouble"? Then your correspondent's remarks tend to show that he is not conversant with modern irons, or else pretends not to be, for they do not lose their heat in a few minutes. We are, &c.,

Cable Accessories Company, Ltd.
P. W. Davis, Engineer.

Tipton.
February 20.

ROTARY CONVERTER PRACTICE.

To the Editor of THE ELECTRICIAN.

Sir,—With reference to the article on "Rotary Converter Practice" in the last issue of The Electrician, it may be of interest to your readers to know that there are at present two 1 500 V 50 cycle 375 kW traction rotary converters in operation in Switzerland which have given excellent results. These machines are at

the Rosental sub-station of the Frauenfeld-Wil Railway, and have been supplied by the Oerlikon Company. Though the machines are now working at a pressure of 1 350 V they are designed for 1 500 V, and have been subjected to exhaustive tests at the latter pressure. The Rosental sub-station is, we believe, the first installation on the Continent to be equipped with 50-cycle rotaries for such a high pressure. We are, &c.,

OERLIKON LTD.

London, W.C. 2. G. WÜTHRICH,
March 6th. General Manager & Chief Engineer.

Electric Light Salesmanship.

At a conference of the ELECTRICAL DEVELOPMENT ASSOCIATION on Feb. 17, Mr. Hadyn Harrison read a Paper on "Salesmanship in Relation to Electric Lighting." Mr. J. W. BEAUCHAMP presided in the absence of Mr. S. T. Allen, who was prevented from attending owing to his work in connection with the N.W.-Midland electricity inquiry.

First Line of Attack.

Mr. HARRISON said that creating a market for anything was generally done by making people dissatisfied with what they already possessed. Just as the advent of the oil lamp had made our forefathers dissatisfied with candles, and the advent of gas made them dissatisfied with oil lamps, so electric light had made many dissatisfied with gas. Even now, however, electric light was far from universal. This was nearly always due to the initial expense, and this should be therefore the first line of attack in order to gain business. Electricity supply undertakings at one time did not encourage lighting as much as they might have done on account of the poor load factor. but now that it had become such a small proportion of their load they no doubt realised that lighting at the present rate was to be encouraged in every way. If the supply authorities had the powers or the means they would probably go in for free wiring and prepayment meters, but this was seldom the case, and the salesman must find some other way of circumventing the difficulty.

The Lower Middle Classes.

The greatest field yet untouched lay among the lower middle classes, the majority of whom lived in houses which were not their own property, and who, therefore, hesitated to install electric light unless the landlord would assist with the expense in some way. The landlord was therefore the man to be tackled. He complained that he was not earning enough on his investment, which was often true, but by spending the necessary capital to wire the house he could increase the rent, for the tenant would be prepared to pay more for the additional advantage of electricity.

In order to ensure that electric light produced a bright and pleasant result it was necessary to do something more than fix a few electric lamps. The endeavour should be made to obtain the same low intrinsic brilliance which gladdened the eye when looking at the light source and yet produced that light which tends to make every occupation a pleasure. The lecturer particularly warned his audience against using too large a shade for the power of the lamp, because the bright appearance would immediately disappear, though the lighting be ample. He also warned them against the use of indirect and semi-indirect fittings, consisting of alabaster or other bowls, unless the cost of electrical energy was of no importance. The "Denzar" fitting used in America was, perhaps, the most suitable for nearly all purposes.

Standard Designs of Shades and Fittings.

Mr. Harrison was in favour of the introduction of a few good standard designs, because the present multitude of inefficient types of shades and fittings confused prospective users of electric light to such an extent that they chose something unsuitable. A salesman should know what he was selling, and a man selling a few lines or even one article, of which he knew the capabilities, was in a better position to do good than the man who brought a hundred and one things to the notice of a customer and knew little about them.

The chief difficulty, however, was to turn scientific facts into talking points, to create the electrical idea. When discussing the proper use of shades, &c., it was best to explain that a saving would be effected in the quarterly bill which would soon wipe off any extra expenditure on the installation. The same applied to cost of electric lighting generally, and it was better to talk of the average cost of an electric lamp per annum than of the total cost of an installation. Mr. Harrison then referred to the difficulties experienced by salesmen with regard to the power of lamps required. Such terms as candle-power, lumens, foot candles, &c., were bandied about in a most careless way by many people who had not investigated what they really meant.

The Study of Decorations.

It was also worth while for an electric light representative to study decorations, and the influence of light and colours upon them. Good artificial lighting, by the influence it had on the appearance of furnishings, &c., would often change the appearance of what was in day-time a dreary room and make it, when lighted artificially, bright and cheerful. Other valuable selling points included the saving in cost of decorating and cleaning, purity of atmosphere and convenience. But all these advantages required to be inculcated by literature or word of mouth, whereas light and brightness spoke for themselves. In order to advance the adoption of electric light every firm or salesman should make certain of marketing something which would help to advance the industry as a whole. It was a mistake to claim too much, as nothing was suitable for every purpose, and claims of such a nature did more harm than good.

The Gasfilled Lamp Criticised.

In the discussion which followed Mr. RAWLINGS said that it was a scandal to the industry the way the gasfilled lamp was being sold. Because it started as a half-watt lamp, the public thought it would only consume half as much current as a one-watt lamp, and the result was that the current consumption was increased, the light was so strong that it almost blinded everybody, and the industry had suffered. If salesmen were a little more careful in advising their clients of the defects as well as the advantages of lamps it would be better.

Mr. SIMON criticised the practice of lamp manufacturers of advertising so extensively their own individual lamps. Valuable space was occupied in that way which could be used for educating the public on the advantages of electric lighting. His experience of contractors—he was a contractor himself—was that they were a self-centred body, and the direction in which they failed was in not helping to develop the industry as a whole. The writing of non-technical articles on electricity in the daily Press would help tremendously.

Mr. CAMPBELL dealt with educational work and blamed the central station people for not approaching consumers as often as they ought. The average consumer was not served properly by any branch of the industry with regard to improving his lighting. He agreed that a standard of some sort should be set up of what a man really wanted.

Supply Engineers' Failings.

Mr. ROGERS dealt with the point that central station people did not approach their consumers. Speaking as a supply station man he could say that, as a rule, the supply stations were condemned and damned for suggesting anything of the sort. He had been struck by the state of some showrooms which contained a conglomeration of fittings, and there was absolutely no chance of showing what any one of them would do.

Mr. BUSH did not agree with Mr. Harrison as to opalised bulbs. If a filament were too bright why bottle it up? Why not put up an efficient reflector? He did not agree with standardising fittings. The Denzar fitting might be very useful in an office, but it was hopeless in a house.

Cheap Current.

Mr. YOUNG said that contractors were doing their best under existing conditions, and pointed out that it would be of great assistance if supply companies gave them current at reasonable rates to enable them to demonstrate their goods in the proper way, and so increase the sale of electricity. He asked that contractors should be registered.

Mr. BEAUCHAMP stood up for the contractors, and said that as a body they were expanding electrically. Co-operation was growing, and that only would enable them to take advantage of expert advice in connection with their advertising. He pointed out the immense advantage of articles such as that which Mr. Simon had mentioned, and asked that others should try to support the industry in that way.

Mr. HARRISON in the course of his reply said he had been misunderstood with regard to standardising. He did not suggest a standard fitting, but that we should if possible have a few standard types of fittings which would give good results. Mr. Simon's suggestion of standardising particular types of illumination, was extraordinarily good. They would then be able to say a reading illumination would be put into one room, a dining illumination in another, and so on. He agreed with the suggestion that electrical contractors should be registered.

Turbo-Alternator Transport.

The York wagon works of the North-Eastern Railway have produced a new 70-ton bogie TROLLEY WAGON for the CONVEYANCE OF STATORS FOR TURBO-ALTERNATORS from the Tyne. The wagon is mounted on two six-wheeled bogies, with plate-side frames, and will carry a load up to 70 tons, either concentrated in the centre or distributed over the well, and is fitted with transverse and longitudinal beams for securing the load. The total length is 57 ft. 6 in., with 54 ft. 6in. over the head stocks; the wheel base of each bogie is 12 ft., the length of well at main girders 14 ft. 6 in., the width 8 ft. 10in., and tare weight 38 tons 16 cwt. 3 qrs. The wagon, it is stated, will shortly convey its first load, a stator from C. A. Parsons & Company, for Shanghai, which will weigh 60 tons.

British Industries Fair, Birmingham.

Domestic Electric Fittings and Fires.

The display of domestic fittings at the Birmingham Section of the Fair is sufficient illustration of the remarkable progress that has been made, particularly since the Armistice, on the artistic side. "Period" styles occupy a leading position, and so do examples of indirect methods of illumination, alabaster being among the most popular of the materials employed. There is also a comprehensive display of electric radiators and cookers, while kettles, boilers, irons, toasters and similar equipment are to be seen in increased quantities.

Electric light fittings, in most artistic designs and of superb finish, are shown by David Shanks & Company, Ltd., of Birmingham (A Building, Stand 20), who have also on view an extensive display of fittings of a specialised kind such as are required in cinema theatres and on ships. Among domestic illumination fittings, the English alabaster bowl occupies a prominent place, these bowls being carved in many beautiful designs. In regard to cinema lighting, specialisation has been greatly developed, and some of the goods displayed show a nice appreciation of the novel requirements of picture houses. Electric signs are also specialised, and may be seen in a very wide range.

The "Angelus Ray" Element.

The British Brass Fittings, Ltd., Birmingham (which includes the firms of Sperryn & Co., Charles Joyner & Co., Ingram & Kemp and Player & Mitchell, all of Birmingham), makes a very representative display of the brass goods produced in the four factories of the amalgamated firm. The range includes electric light fittings, electrical accessories, and tram and railway fittings. Electric heating on the "Angelus Ray" principle is shown to be thoroughly effective in a number of applications, the principle being that the whole of the radiant heat is concentrated and thrown forward by means of reflection. The "Angelus Ray" element consists of an open frame made of nickel-plated steel, which is fitted with a detachable reflector and a double row of small insulators; the latter are of highly refractory material, and between them the resistance wire is suspended. Many artistic patterns of frames of "Angelus" fire are displayed, as well as pedestal fires with a parabola reflector, with surface highly polished, and giving an intense concentrated heat.

On the stand (No. 21, Building A) of William Whitehouse & Co., Ltd., Birmingham, electroliers of beautiful design and in solid brass cast, in oxidised silver, are an arresting feature, and among many other things the firm gives prominence to an elaborate fitting with 12-light Huntalite candles. This exhibit is in itself a fine piece of workmanship and solidity, weighing about ½ cwt.

T. R. Carpenter, Ltd., of Birmingham (Building A, Stand 3) are responsible for a good display of electroliers, shade pendants and bowl fittings, as well as for table and floor standards, many in oxidised silver. Among the table lamps shown the Georgian and Jacobean styles predominate.

Superior Electric Fires.

May & Padmore (Building A Stand 69) feature their "Maymore" electric fires, irons and electric cooking apparatus. These have evidently been designed to conform to the decorations of better-class homes, the colours being carefully selected and the work carried out in vitreous enamel finish. The elements are carried on good-class heat-resisting porcelain, and are designed to give maximum heat in proportion to the current consumed. The stock voltages are: 100/110 V, 200/220 V and 230/250 V, the loading being 375 W and 500 W per element bar. A capital range of electric fires include one, two and four bars, and a new bowl fire is displayed; this tips up and provides a rest for a kettle. A useful immersion heater, loaded at 250 W, is also given prominence.

The Premier Heaters, Ltd. (Building A, Stand 36) display a wide range of electric heating and cooking apparatus, electric fires and radiators, and there are handy and efficient contrivances for use in tailors' and laundry workshops.

On the stand of Evered & Co., Smethwick (Block A, Stand 23), there is a very fine display of electric fittings, which are excellent examples of decorative art. One is an ornate cast brass fitting of the French style, from the centre of which emerges three large alabaster shells. The flambeau for hotel halls and picture houses is also very effective.

For another exhibit of more than ordinary interest, Best & Lloyd, Ltd., Handsworth (Building A, Stand 32) are responsible: it is noteworthy by reason of the artistry that is shown and for the beautiful finishes. Many of the samples are in the Period style. Indirect illumination methods are predominant, English alabaster bowls being an excellent feature. Other items of interest include the "Best" electric heaters.

The Falkirk Iron Co., of Falkirk, have a representative display of their well-known electric cooking apparatus. As this is also being shown at the Ideal Homes Exhibition, we shall describe it in due course under that heading.

Country House Plants.

Engines of various types are displayed on Stand 176 (B Building) by the Heatly-Gresham Engineering Co., Ltd., Letchworth. Among the combined sets shown are some compact models suitable for country house and farm lighting and power requirements, for working cinemas and for the supply of electric light and power in any isolated situation. The dynamos of these sets have been lent by Electromotors. A standard battery charging switchboard, by Crompton & Co., is also exhibited, together with a model storage battery manufactured by Pritchett & Gold and Electric Power Storage Co.

The Austin Motor Company, Northfield, Birmingham (Building A, Stand 49), make a feature of their automatic lighting sets (which are seen in motion), and which are suitable for private installations in country houses, hotels, farms, and the like.

Electric Hoisting Gear.

Holt & Willetts, Cradley Heath and Lye (B Building, Stand 163), make a feature of electric power machines of various kinds. One, a hauling winch, is fitted with warping drums and driven by totally enclosed electric motors, capable of lifting 3 tons at a speed of 50 ft. per min. All gears are machine cut, the pinions being of mild steel. Attention is also attracted to a direct coupled electric hoist gear for passenger or goods lifts, which is of the totally enclosed worm-geared type, with phosphor bronze worm wheel and steel worm. It is fitted with mechanical or electro-mechanical brakes, and either hand rope, switch in car, or full automatic push-button systems of control. The rope drum is of either the winding type or grip sheave type. This gear is made in various sizes to deal with loads from 5 cwt. to 5 tons. The firm also make heavy duty goods or platform hoists for loads up to 50 tons. An electric overhead travelling crab is shown, suitable for double girder electric overhead travelling crane, capable of lifting 3 tons at a speed of 25ft. per min. and travelling along the crane bridge at 75 ft. per min. This crab is of standard type, as supplied with 3 and 4 motor electric overhead cranes, and can be made of any span to suit the centres of gantry rails. Pulley block and friction hoists also command attention.

Controllers and Resistances.

The Electro-Mechanical Brake Co., Ltd., has an exhibit consisting of many examples of controllers and grid-type resistances. A range of steel-cased drum-type controllers for dealing with loads of from 5 to 100 H.P. are included. A special feature of these is the ease with which the drum can be withdrawn by simply loosening back four bolts. There is ample space for cables and entry at the back, side, or bottom of the controller can be arranged. For ships' winches a special watertight design has been produced. The "Midget" controllers shown are similar in some points of construction to the larger type, but are for single pole only and suitable for series motors, being especially adapted to the control of hoists, wall cranes, pulley blocks, or telphers. The frame consists of two cast-iron end plates supported by mild steel bars: the cover is of heavy-gauge sheet steel, and is secured in position by substantial quick-releasing latches. As in the large controller, arc shields are fitted between all contact fingers. These shields are mounted on a pivoted arm, allowing the whole to be swung out. The drum consists of a series of cast-iron sections clamped to a square mild steel shaft and insulated from it by mica. The drum contacts are of hard-drawn copper, fastened to the drum casting by countersunk headed screws, permitting easy replacement. A number of jointless and rustless grid resistances of various sizes are shown. These are made of wire of uniform cross-section and continuous length, with a temperature coefficient and current-carrying capacity similar to those of cast-iron. The insulation is mica and micanite, tested to 3 000 V. a.c. Resistances designed for special purposes such as battery-charging, locomotives, traction and kinema regulating are also exhibited.

Electric Furnaces.

The Ajax-Wyatt Furnace Company, 17, Victoria-street, London, show their electric induction furnace for melting brass, &c., on Stand 195 in Building B. This furnace is of exceptional interest in a centre like Birmingham, as it is specially designed for melting brass and alloys containing zinc and other volatile metals. As the heat is actually generated in the metal, and not conveyed by conduction or radiation, it is claimed that melting costs are much reduced. Clean scrap melted shows a loss of less than 1 per cent. of the total melt charged, while the loss of zinc is less than ½ per cent. of the metal charged in the case of ordinary yellow brass. Other advantages claimed include the complete mixing of the metals in the alloy. These furnaces, which were originally of American origin, are now being made in England by Campbell, Gifford & Company. On the same stand the firm is showing the Soderberg continuous self-baking electrode, which, it is claimed, marks an important improvement in the manufacture of electrodes, eliminating breakages and consequent trouble. Its cost is said to be about half that of the best quality amorphous types, and the consumption is slightly less. There are two types, one for tilting steel furnaces and the other for ferro-alloy, carbide, and other fixed furnaces. It is hoped that one effect of its use will be the cheapening of carbide and of ferro-alloys.

Hancock & Company (Engineers), Ltd., of Wallington, Surrey, show on Stand 169 in B Building their high-temperature electric furnaces, which may be seen working at temperatures up to 2 000° C., hardening high-speed steel, melting steel, &c. The furnace is a muffle-type furnace of the resistance type, the resistances running longitudinally up and down the outside of the muffle tube and being sealed between this and the refractory tube. The muffle and outer refractory tubes are made of a special grade of carborundum, which is capable of withstanding excessive temperature without damage.

The tubes have, we understand, a long life, and will not crack unless subjected to very rough usage. The resistances are made of a special carbon rod. The aim of the designers has been to produce a furnace which is, to all intents and purposes, indestructible.

The Premier Electric Welding Company, Ltd., of St. James's-street, London, S.W. 1, are showing on Stand 1, Building B, a particularly comprehensive exhibit of electric arc welding apparatus. The firm's plants are operated in accordance with their patent design, whereby series resistances have been done away with. They embody a special form of reactance which materially assists the welder in obtaining a steady arc.

"Apex" Switchgear.

An interesting exhibition of welding transformers, spot welders and switchgear of the quick "make" and "break" pattern is made by the Foster Engineering Company, of London (Building A, Stand 39). The principle of this latter action is embodied in the "Apex" switchgear, consisting of knife switches, ironclad switch-fuse gear, and mine-type switchgear. In the "Apex" ironclad switch, which is extremely small, the switch blades make and break contact at the same time, and the action, being a parallel one, ensures, it is claimed, the arc being distributed evenly over all four contacts. The switch blades are mechanically held off the contacts by the cover when the latter is open. Prominence is also given to the "Apex" water-tight fused switch, which is made in three sizes—30, 60, 100 A—the removable switch blades and fixed contacts being a self-contained unit in a box, so that their relative position is not altered when the cover is removed.

Mining Switchgear.

William McGeoch & Co., Ltd., of Birmingham, have a very comprehensive stand (No. 22, Building A), where electrical switchboards, switches, switch gear, fuseboards and couplings for electric railways and tramways are to be found. Prominently displayed is a combined ironclad switch and fuse box suitable for circuits up to 500 V. The switch is of the firm's standard S.D.B. type, the blades break simultaneously from both contacts and are dead in the "off" position; the contacts are mounted on porcelain, and the fuses can be withdrawn without the operator's hand coming in contact with "live" parts. There is also on view a variety of equipment for coal mines and for marine work, and among the former reference may be made to flame-proof switches and fuses for use in fiery mines. These switches are fool-proof and are fitted with steel coupling bars, insulated by micanite, mounted in cast-iron cases, the cable holes being fitted with glands for insulated linings. Other switches to which special attention may be directed are provided with cable-dividing boxes, and popular interest centred also on the Morse code electric flashing apparatus, for night signalling at sea, and on the navigation light indicators. By means of the latter, should a navigation light go out, the corresponding lamp in the engine-room lights up and a bell is rung, so that the fault is at once detected. The firm's display includes a wide range of electrical fittings, artistic and ornate, for use in the home or in theatres and other public buildings.

Power Presses.

Hollings & Guest's exhibits include their hydraulic tyre press for removing and fixing the solid rubber tyres of commercial vehicle wheels. Another important exhibit is a bending press for bending plates cold up to 6 ft. in width, as used for making safe bodies, tanks, conveyors, colliery tubs, and similar work. A hydraulic scrap bundling press is also exhibited by this firm. The press consists of a rectangular cast-iron box, 27 in. by 15 in. by 30 in. deep, with a hinged cover. The hydraulic ram is arranged underneath this box, with a table, which fits closely inside the box. The whole apparatus is let into the ground so as to bring the top of the box to a convenient height for throwing in the material. The box is filled with old tins and other material to be dealt with. The lid is then swung over, and the pressure turned on by the valve. As soon as the maximum pressure is reached, as shown by the pressure gauge, the operator releases the valve and swings off the cover, and the ram ejects the bale from the press. The operation is then repeated. For driving these machines—which are in actual working operation on the stand—a set of two-throw hydraulic pumps is supplied. These pumps present a novel feature, as they consist of a vertical two-throw pump built up on a bed plate and driven by means of chain gears from an electric motor. This gives a quiet and efficient drive, superior to the ordinary noisy spur gear drive.

New Range of Ironclad Switches.

J. H. Tucker & Company are exhibiting (No. 38, Building A) four examples of an entirely new range of small moderate-priced accumulator switchboards, specially designed for use with modern small private plants using low voltage metal filament lamps on the latest wiring systems, in addition to examples of their general switchboard components and various types of fuse and distribution boards. They are also showing an entirely new range of ironclad switches, without and with fuses, combined in the same box, embodying several patented improvements. A representative selection of fusegear for supply services and industrial use, to comply with Home Office requirements, will be on view. In connection with tumbler switches, a special demonstration is given of the numerous controls for electric light obtainable with "Tucker" switches. Though pioneers of this type of switch, several novelties show that the company are keeping in the forefront of modern progress.

Miscellaneous Exhibits.

Fuller's United Electric Works, Ltd., display on their stand (Building A, Stand 48) electric wires and cables, ebonite mouldings, and a complete stand of miners' electric hand lamps. The last named are fitted with block accumulators; they are claimed to be fool-proof and capable of withstanding very rough wear. The firm also show a mine signalling set, and over the stand appears a replica of a miner's electric safety lamp.

There are many interesting electrical contrivances, and one which will appeal to motorists is an inspection lamp (the Kendrick), the exhibit of the Neale Magnet Construction Co., Ltd., London, in A.A. Building, Stand 24. It takes the form of a combined lamp and electro-magnet, which adheres firmly to any iron or steel surface, thus enabling the light to be thrown on any particular point required. The base, which is magnetised, contains a coil connected to the ordinary circuit from the car lighting set; a push switch in the base facilitates rapid removal without putting out the light. The lamp is supplied for 6 or 12 V circuits, with bulb, flexible cord and box, and for 100 to 120 V and 200 to 250 V circuits for garages, engineers and shipbuilders.

The Ebonestos Insulators, Ltd., London (Building A, Stand 43), are well represented by moulded insulators for all classes of electrical work, specially adapted for terminal blocks and nuts, switch handles, bushes and bases. They are made in heat, alkali and acid-resisting grades, the material being in all cases impervious to moisture. Before the war this material was imported largely from Germany, but little has since arrived in this country.

Industrial Appliances, Ltd., of 38, Victoria-street, Westminster (Block B, Stand 255, and in the corridor leading from Block B to Block C), display their "Railodok" industrial freight truck. The reliability of these vehicles is generally recognised, and much help was given to exhibitors for the conveyance of their products from railway sidings to the various stands.

The Consolidated Pneumatic Tool Co., Ltd., London (Building B, Stand 13) make a feature of electric drills for drilling, reaming, tapping and tube expanding; also portable electric grinders and polishers and electric hoist, winch and saw. Electric welding plants on the resistance system, with examples of the work performed, are also shown, on which spot, seam and butt welding may be effected on one machine.

At the stand (133) of W. Canning & Company, Birmingham (A Building), one is able to appreciate by the wide range of goods there displayed how great has been the development in electro-plating and polishing. There is on view a good collection of low-voltage plating dynamos from 6 A to 500 A, though the firm supply complete sets in outputs up to 3 000 A. Space considerations will, of course, not permit of the display of these. Rotating plating barrels and polishing machines in motion give an added interest to this exhibit.

On the stand of Geo. Salter & Co., Ltd., West Bromwich (Building B, No. 236), there is displayed the Salter improved tension indicator and draw tongs for use in fixing and joining up telegraph and other electric lines.

Readers of The Electrician will be interested to learn that all the electricity meters used on the stands in this Fair were supplied by Chamberlain & Hookham, Ltd., of Birmingham.

On Friday last a party of representatives of the Electrical Wholesalers' Federation visited the Fair. They were entertained to luncheon at the invitation of the British Electrical and Allied Manufacturers' Association, many members of which are exhibiting. A cordial welcome was given by Mr. H. O. Worrall, the chairman of the Fair Council, who expressed the hope that all the electrical manufacturers would eventually participate in the Fair, and put up exhibits so extensive and of so attractive a character as to make the exhibition indispensable to those associated with the Wholesale Federation. Mr. A. G. Beaver, the newly-elected president of the Wholesalers' Federation, joined in the hope that some such arrangement might be brought about, and that they would all come in a body to view the exhibits. He believed it would be of mutual benefit.

U.S. Electrical Exports in 1921.

Exports of electrical goods from the United States in December, 1921, amounted in value to $5 177 276, making the total preliminary figure for the entire year $97 935 597. The following information taken from the U.S. "Commerce Reports" show the preliminary figures for 1921 with comparative data for 1920; batteries $3 831 738 ($6 633 542); carbons $433 869 ($1 477 831); dynamos and generators $7 942 473 ($7 796 305); fans $1 270 253 ($1 364 742); heating and cooking apparatus, $1 637 450 ($1 801 127); insulated wire and cables, $8 573 820 ($8 208 539); interior wiring supplies, $1 848 793 ($3 386 068); arc lamps, $13 795 ($25 098); carbon filament lamps, $125 045 ($114 542); metal filament lamps, $3 148 635 ($4 051 835); magnetos, spark plugs, $1 313 614 ($3 601 419); meters and measuring instruments, $2 726 448 ($2 676 538); motors $15 444 024 ($13 421 550); rheostats and controllers, $1 044 393 ($707 719); switches and accessories, $4 033 299 ($4 438 773); telegraph apparatus, including wireless, $1 010 891 ($713 798); telephones, $4 798 923 ($3 898 987); transformers, $7 988 440 ($4 803 158); all other, $28 628 982 ($32 868 433); total electric machinery, $95 814 885 ($101 990 004); electric locomotives, $2 120 712 ($880 430); total, $97 935 597 ($102 870 434).

Legal Intelligence.

The Lodge Tuned Wireless Patent.

On Monday the Royal Commission on Awards to Inventors, presided over by Mr. Justice Sargant, commenced the hearing of claims by Marconi's Wireless Telegraph Company and the Lodge Muirhead Wireless and General Telegraphy Syndicate for an award in respect of infringement by the Admiralty of Sir Oliver Lodge's patent, No. 11575 of 1897, the validity of which was established in 1920 before the late Lord Moulton.

Mr. J. Hunter Gray, K.C., for Marconi's Company, said they and the Lodge Muirhead Syndicate had come to an agreement, and were really supporting the same case. The Lodge Muirhead patents had been sold to Marconi's Company. The late Lord Moulton had found that the Lodge Patent was valid, and that certain instruments used by the Admiralty were infringements, and all the Commission had to do was to assess the amount of royalty to which the applicants were entitled. Lord Moulton's award provided that an amount should be paid by the Admiralty (over and above the amount already agreed for the use of Lodge's patents referred to in the schedule to the award), and that the Royal Commission should be requested to divide their award into three parts to cover the period (1) from the date of the patent (May 10, 1897) to March 31, 1903, (2) April 1, 1903, to Oct. 20, 1911, and (3) April 3, 1914, to May 10, 1918. On April 1, 1914, the Marconi and Admiralty agreement expired, and May 9, 1918, was the end of the 21 years of the Lodge patent, as extended by Mr. Justice Parker. On Oct. 20, 1911, the Lodge Muirhead Syndicate assigned the patent to the Marconi Company. From Oct. 24, 1911, to 1914 there could be no claim, because it was a patent vested in the Marconi Company. The claim of the Marconi Company was for £1 037 736, and that of the Lodge Muirhead Syndicate for £160 600. The royalties charged to the Admiralty and other purchasers had been for a long time £100 per ½ kW for large sets, and various figures down to £25 per ½ kW for very small sets.

The Chairman, being informed by Mr. Gray that the Admiralty had paid the same charge for instruments when there were 14 years of the patent to run as when there was only one year to run, expressed some doubt whether it was right that the Admiralty, who were statutory licencees, should pay the same amount in both cases.

Sir Arthur Colefax, K.C. (for the Admiralty) said the Admiralty claimed that they ought not to have to pay on the kilowatt per annum basis.

Mr. Gray said he was concerned at present with amounts that the Government had paid in later years. They paid £200 for 1½ kW or 1¼ kW. The Admiralty bought apparatus from the Marconi Company and paid a royalty of £200 per kW or part thereof, and he submitted that no other basis was so correct.

Sir Duncan Kerly, K.C. (for the Lodge Muirhead Syndicate) also addressed the Commissioners, and made a point of the fact that Sir Oliver Lodge and Dr. Muirhead made nothing out of the invention, and to this moment Sir Oliver Lodge had only made out of it a retaining fee of £1 000 a year for seven years, while the late Dr. Muirhead and his representatives had made out of it something like "a negative sum of £10 000."

Sir Oliver Lodge's Statement.

At this stage a statement by Sir Oliver Lodge (of which the following is an abstract) was read by Counsel:—In the early stage of wireless telegraphy the method of signalling was by sudden jerk—an electric pulse of whip-crack suddenness was emitted, and its effect at a distance was detected by the sudden snap of an insulating film in a receiving coherer. The emitter was an elevated wire excited by a spark, and the collector was a similar or the same wire attached to a coherer. Under these conditions no selection was possible. It could be done only by the introduction of self-induction in conjunction with capacity. Up to the time of my patent, neither of these ideas had entered wireless telegraphy. I arranged that the emitter should have both capacity and self-induction, which are essential to a tuning fork and every persistent vibrator. The use of self-induction was at that date not really known, even to some telegraphists of eminence, though the theory of electrical vibrations by aid of self-induction and capacity was known to Lord Kelvin and pure science ever since 1853. Self-induction, a name invented by Clerk Maxwell, was ignored by practical men as an unnecessary intrusion. Heaviside had applied it theoretically to cables, but neither he nor Lord Kelvin thought of applying the idea to wireless. The principles of persistent vibration being known, the novelty consisted in the practical application of these principles to wireless. It had not occurred to anyone to apply them, nor was it obvious how to do it. My own experiment of the resonating Leyden jars had given me the clue. I arranged that the oscillations should accumulate in a condenser, associated with a self-induction coil, until it overflowed. The overflow would give the necessary jerk and stimulate the coherer, but no overflow would occur unless the electric oscillations had been gradually worked up by resonance. And for that there must be tuning. The emitter must send out a long series of waves, therefore, instead of a single pulse. So I enlarged it into a capacity area, or pair of capacity areas, and I inserted a coil of variable self-induction between the two areas, or between one of them and the earth. Thus I gave both emitter and receiver capacity and self-induction, the essentials to durable electrical vibration. Emitter and collector forthwith became vibrator and resonator respectively. By the device of signalling on different wave lengths, all the complexity of modern wireless telegraphy became possible, and any one station could henceforth be listened to, to the exclusion of all others. The principle of resonance thus utilised is so powerful that there is no real loss of efficiency and the range of signalling is even increased by this device; for though each pulse may be insignificant, an accumulation of 30 or 40 pulses is wonderfully effective. The resonator picks up the vibrations intended for it, works them up to the desired intensity, overflows, and disturbs the detector and gives the signal. Vibrations of any other wave length cannot be worked up by sympathetic resonance, so they are powerless to disturb unless they are very strong, like occasional atmospherics. There is no other way of achieving this end electrically than by the use of self-induction and capacity, and my patent shows exactly how to use them, and therefore how to do it. It further shows how to modify the self-induction, so as to get oscillations of different wave lengths at will. It also shows how to construct a suitable resonator on the principles of the resonating jars, how to connect up the coherer or other detector, and how to tune the resonator accurately so as to pick up the desired station and ignore all others.

Sir Oliver Lodge accepted Sir Arthur Colefax's statement that at the time of the application for prolongation of the patent the accounts showed expenditure £33 167, which exceeded the receipts by £5 882. The patent was sold in October, 1911, to the Marconi Company, and the syndicate was liquidated. The consideration paid for the patents was £18 000 to the Muirhead Company, and he was to be retained as scientific adviser to the Marconi Company at £1 000 per annum.

Mr. C. F. Wilkins, director and manager of Muirhead & Co., gave evidence, which was chiefly directed to show that the amount of business done under the patent had not been very extensive, and that the charges made for royalties had been substantially on the same basis as those which were now claimed from the Admiralty.

Mr. Wilkins was still under examination when the Court adjourned.

B.T.H. Company v. Corona Lampworks.

On Tuesday Mr. Justice Astbury delivered his reserved judgment in this action to restrain an alleged infringement of plaintiff's patent (No. 23 775 of 1912) for improvements in and relating to evacuated vitreous containers having sealed-in conductors. The defence was a denial of novelty, want of subject matter and utility, anticipation and insufficiency of directions in the specification. After an elaborate survey of the evidence his Lordship found that the patent had been infringed, and granted the desired relief, with costs.

In the course of his judgment his Lordship said that the alleged invention included (*inter alia*) incandescent lamps. Prior to plaintiffs invention in 1912, platinum was almost universally used for the leading-in wires. Efforts had been made to find a less expensive substitute for platinum, and when it was remembered that 300 000 000 lamps were now sold every year, the importance of a substitute for commercial purposes would be realised. Plaintiffs claimed to have solved this problem and to have invented a substitute possessing commercial advantages far exceeding any alternative previously used. That substitute had displaced platinum almost entirely, and the cost of the new leading-in wires was trivial in comparison. In construing plaintiffs' specification it must be borne in mind that the first essential was that the wire should seal in the glass so as not to leak. The length of the wire was about thirty-two times its width and when the glass cooled and enclosed the wire the expansion and contraction of the wire would be largely controlled by the glass, and as the wire, when cold, must keep the hole stopped up, it was vital that the co-efficient of the wire should approximate to that of the glass. He construed the specification as showing an aggregate co-efficient which was what plaintiffs contended for, and if he were right in that construction and the patent was valid defendants' lamps were a clear infringement. On the question of the validity, his lordship examined the alleged prior publications, and said he did not find plaintiffs' invention or anything like it published in any of the prior specifications relied on. The next ground on which validity was attacked was that on insufficient or misleading directions. It was said that no directions were given as to whether the expansion of the wire was to be measured in a radial or longitudinal direction. Having heard the evidence of the experts as to the interpretation of those directions, he was of opinion that defendants' objection on this ground was unsound. The patent was likewise attacked on the ground that the invention was not useful, but this plea also failed. The plea of want of subject matter was hopeless, and in his judgement plaintiffs' patent was valid, and claims 1 and 2 of the specification had been infringed by defendants. There would be judgment for plaintiffs for the relief claimed, with costs.

Sir Duncan Kerly (for defendants) asked for a stay with a view to an appeal.

Sir Arthur Colefax, K.C. (for plaintiffs), opposed, and said defendants were not manufacturers of those lamps: they were dealers, and plaintiffs had had litigation with them before, and there was a matter of costs which had not yet been settled.

His Lordship: If that is the fact, Sir Duncan, things must remain as they are.

The March issue of "The Cost Accountant," the official journal of the Institute of Cost and Works Accountants, contains a full report of the Costing Conference, held under the chairmanship of Lord Weir of Eastwood. Specimen copies may be obtained from 38, Grosvenor-gardens, 1s. 7d., post free.

Parliamentary Intelligence.

Electricity (Supply) Bill.

The second reading of this Bill was moved by Viscount Peel in the House of Lords on the 2nd inst. He explained that it was an amendment of the 1919 Act, and unless the Bill or some similar Bill became law it would render futile and ineffectual a great number of the provisions of the original Act. The controversial provisions and clauses in last year's Bill had been omitted, and, so far as the Electricity Commissioners knew, there was now no controversial clause left. As a result of their general survey of the country, the Electricity Commissioners had come to two main conclusions, namely: (1) The general wastefulness and inefficiency of the present organisation for supply; and (2) the urgent need for joint action among the supply authorities in order to economise in coal, to make better use of capital and to produce, as a result, a cheaper article. The Commissioners had delimited sixteen electricity districts, and when they had finished their work the number would probably be something like twenty. In eight of those districts schemes for re-organisation had been provisionally approved. In the first four of these eight it had been decided to set up joint electricity authorities. In two more joint electricity authorities had been proposed, and in the next two an advisory board and an advisory committee had been respectively suggested. The general note running through the Bill was consent, and not compulsion. There had been found to be a general desire for co-operation, both among companies and authorities, and powers of compulsion were unnecessary. Every encouragement was given throughout the Bill to private enterprise. One of the main objects of the measure was to give powers of raising money to joint electricity authorities.

The debate was adjourned.

(On Tuesday) The Earl of Bessborough said that in spite of two years' constant work by the Commissioners, in no single instance had any Order yet been issued nor any scheme which they had propounded, and he was informed that not a single scheme had been accepted by any of the electricity supply authorities concerned. Clause 5 (4) compelled authorised undertakers to contribute towards any administrative expenses of the joint electricity authority, and to meet deficiencies in the fund established under the Act of 1919. He could not agree that where the Bill was permissive it was necessarily innocuous. Some limit should be placed on the amount which local authorities were to be allowed to raise for the purpose of loans to a joint authority. The proposal which required authorised undertakers to contribute to the expenses of the authority and to make up their trading losses was as highly objectionable.

Viscount Haldane thought that there was a tremendous case for the proposition before the House, in view of the serious position which the country found itself in and the crippling of its industrial powers compared with other nations. The consumption of coal for industrial purposes could be greatly reduced if reasonable care was taken. Small generating stations were always very wasteful. In London there were seventy generating stations, fifty different systems of supply, twenty-four different voltages, and ten different frequencies. How could they have efficiency in that way? If they in that House prevented the public and industries from getting the advantage of a cheap supply of electricity it would be a day of ill omen. He suggested that London might well have one generating station, say, near the mouth of the Thames. Under the conditions that existed, how could it be said that we were in a satisfactory position in this country? There were 600 generating authorities in the country, and their production was ridiculous when compared with modern standards. In the United States of America and on the Continent generating stations were enormously greater than ours and their prices much less.

Lord Monk Bretton, speaking on behalf of the London County Council, said they attached the utmost importance to the second reading of this Bill.

Lord Gainford was convinced that, in spite of the severe handicap which the large London companies had to meet last year owing to the coal strike, there was a steady improvement going on in the way in which private enterprise was dealing with the matter. The fact that there was no more popular investment than those companies showed that the public had confidence in private enterprise. He knew of one of the large companies which recently offered to supply a London borough with electrical energy at 20 per cent. less than the council could produce it, but the council preferred to charge the ratepayers the 20 per cent. more because they preferred to have the supply in their own hands.

After Viscount Peel's reply, the second reading was carried by fifty-nine votes to forty.

Admiralty Electricians.

In reply to Sir C. Kinloch-Cooke (House of Commons, March 6), Mr. Amery said the Admiralty were fully aware of the lack of promotion in the Electrician Branch, which was due to the present authorised establishment being considerably overborne. This position was not peculiar to any one branch. The two officers of the Electrician Branch serving in his Majesty's ships "Ambrose" and "Lucia" were withdrawn, as the complement of these vessels did not provide for warrant electricians being borne; these withdrawals did not cause vacancies. During the last 18 months four retirements of officers of the Electrician Branch had taken place, but, as the numbers now borne were considerably in excess of the authorised establishment, it was not possible to make any promotions in the vacancies. The whole question of the establishment of warrant officers to be maintained would be further considered shortly. The Admiralty were of opinion that no sufficient arguments had been advanced for electrical artificers to have the same allowance as engine-room artificers. The engine-room artificer had to show himself capable of using his knowledge in exercising distinct responsibility in taking charge of moving machinery without the direct supervision of a superior officer, whereas the electrical artificer, except in rare cases, did his work, which was entirely manual, under the direction of an officer. The chief engine-room artificer's allowance was given to him for having proved himself capable of taking complete charge of propelling machinery of a small ship where no engineer officer or warrant officer was borne. There was no parallel in the case of a chief electrical artificer.

German Wireless Press Service.

In reply to Mr. Hurd (House of Commons, March 6), Mr. Chamberlain said his attention had been called to the anti-British and anti-French propaganda which was being scattered over the globe in English by the German wireless Press service from Nauen. With regard to the British wireless means available to counteract this mischief, three wireless messages containing British news were prepared daily by the News Department of the Foreign Office and sent from the General Post Office wireless station at Leafield. They were picked up and widely reproduced in most European countries and by ships at sea. The completion of the wireless station at Cairo would, he hoped, enable these messages to be retransmitted and similarly used in the Far East.

Railway Electrification.

Replying to Mr. Gilbert in the House of Commons of Monday, Mr. A. Neal said he was not aware of any of the London railway or tube companies applying for a grant from public funds for extending or electrifying their lines, and no grant had been made. Applications for guarantees under the Trade Facilities Act had been made by the South-Eastern and Chatham and the London Electric Railway companies and referred to the Advisory Committee appointed under the provisions of that Act, and they are under consideration.

Amateur Wireless Costs.

In a written reply to Sir H. Norman (House of Commons, Feb. 22), Mr. Kellaway stated that the annual expenditure on amateur wireless of £5 200 is made up as follows: Correspondence and inquiries relating to the issue of licences, alteration and removal of installations already licensed, and maintenance of records (including typewriting), £3 575; inspection of stations by engineering officers, £1 000; accounting, £625.

The Urgent Cable Service.

In reply to Sir G. Renwick, the Postmaster-General (Mr. F. G. Kellaway) stated in the House of Commons on Monday that the "urgent" service was introduced as the result of representations from the commercial community; and while the delay remained abnormal, and an urgent service was available in foreign countries, he did not think it would be in the interests of British cable users to abolish it.

Dover's Claim Against the Admiralty.

Mr. Amery stated, in reply to Sir T. Polson (House of Commons, March 6), that a settlement of the claim made by Dover Corporation against the Admiralty, for payment of an account for electricity supplied, would probably be reached at an early date. He added that, pending such settlement, advances on account had already been made, the last of which, amounting to £600, was paid on Feb. 22.

Underground Railway Extensions.

In reply to Mr. Erskine (House of Commons, March 2) Sir Robert Horne stated that Lord Ashfield's scheme for the improvement and extension of the Underground and Tube Railway system had not been finally rejected.

Grampian Electricity Supply Bill.

The Grampian Electricity Supply Bill passed its first reading in the House of Commons last week.

Company Legislation in Australia.

The Commonwealth House of Representatives has passed a Bill to Amend the War Precautions Act Repeal Act of 1920. Section 19 of the latter act, which has now been repealed, required the agents in Australia of all overseas companies and firms to furnish particulars regarding the business of their principals to the Collector of Customs in the State in which their chief place of business was situated. The particulars included the name, address, capital, and balance sheet of the company or firm. Under the Companies and Firms Acts of the States all companies and firms carrying on business in Australia in their own names must be registered, irrespective of whether their head offices are established in Australia or abroad, and the effect of Sec. 19 was to require them to re-register with the Department of Trade and Customs. This obligation imposed a great deal of trouble, and strong exception was taken by British companies, especially to the provision requiring them to furnish particulars of their financial position to their agents in Australia for submission to the Department of Trade and Customs.

Wimbledon's Electrical Engineer.

Mr. Tomlinson Lee's dismissal from the position of Electrical Engineer after twenty years' service was again discussed at a meeting of the Wimbledon Town Council last week, when Councillor A. W. Hickmott, chairman of the Electricity Committee, stated that the reason for the Commitee's action was that they had lost confidence in Mr. Lee. The Committee deliberately came to the conclusion that Mr. Lee should either resign or have notice. He refused to resign, however, unless the Council agreed to pay him £3 000. There was no ill-feeling against Mr. Lee. The Committee thought a change in the management ought to be made, and it was their unpleasant duty to say so to the Council, and, having got their approval, to act. The plain fact was that for some years past Mr. Lee's conduct had not been satisfactory to the Committee. He did not show any desire to work cordially with his Committee or to co-operate with them in what he knew they had much at heart—the greatest economy possible in the working of the undertaking.

In the lengthy discussion which followed Councillor Hickmott's explanation, Councillor Bellingham said that with regard to the alleged difficulties of Mr. Lee working harmoniously with the Committee, and that these difficulties had been accumulating for years, such an explanation was absolutely ludicrous. The Committee was constituted only last November, and at least five new members were upon it who could not have had any knowledge whatever of the way in which Mr. Lee had conducted the department.

Acting on the recommendation of the Electricity Committee, the Council have authorised the appointment of Chief Electrical Engineer to be made by the Staffing Committee and the Electricity Committee jointly.

While the Council meeting was being held a protest meeting was taking place outside the Town Hall, and a deputation waited on the Council with a view to urging them to postpone all steps with the object of filling the vacant position until after a public inquiry had been held and a report had been published concerning the facts. They got no satisfaction, however, from the Council.

Oxford-street Lighting.

Those who watch the signs of the times will note that Oxford-street, always a well-lighted street, has now become one of the best—if not the best—lighted street in London. The St. Marylebone Borough Council have every reason to be proud of this striking improvement in this important shopping centre, and also of their enterprising Electricity Department, who carried out the work, with so much success and in such a miraculously short time in order to be ready for the Royal wedding festivities. When the idea was first put forward of making this an example of the most perfect street lighting possible the Electricity Committee consulted their electrical engineers, who caused samples of new street-lighting lanterns to be erected, among which was a type suggested by Mr. Haydn Harrison, who realised the importance of not only lighting the roads and pavements, but also the shop fronts, for which this street is justly famous. It was apparent from the first that this lantern was the most suitable in every way, and was selected by the Council and Lighting Committee and their engineers, who are to be congratulated on the excellent results obtained.

The work of producing a sufficient number of these lanterns in so short a time was undertaken by the Electric Street Lighting Apparatus Company, who manufacture Mr. Haydn Harrison's designs at their works in Canterbury. The special feature of this lantern is the large light-radiating surface, which is produced by using thin sheet glass, ground on the inner surface, the light absorption of which is very low; this at the same time completely screens the light source from the eye. The lanterns are also very substantial, only cast iron and copper being used in their construction. The former provides a very large area of cooling surface, which, supplemented by an efficient ventilating system, allows of gasfilled lamps of nearly any power being adopted. The reflector being of enamelled earthenware, no diminution in efficiency takes place due to heat, and all parts are easily cleaned.

Southampton Technical Staff Dispute.

A serious difference has arisen between Southampton Corporation, the E.P.E A. and the E.T.U., as the organisations representing the technical staff of the electricity undertaking, owing to the following decisions with respect to all salaries and wages not governed by awards: 1 (a) that a reduction of 20 per cent. be made on all salaries not exceeding £499 per annum, 17½ per cent. on salaries from £500 to £699, 15 per cent. from £700 to £949, 12½ per cent. from £950 to £1 249, and 10 per cent. over £1 250. 2 (a) all awards to operate under present conditions until Oct. 1 next (when the subject will again be considered), except (*b*) the technical and the electricity works clerical staffs electricity award, where special reductions are proposed, but if these do not become effectual by April 1 the above reduction of 20 per cent, shall apply in these instances.

The above recommendations of the Parliamentary and General Purposes Committee were adopted by a majority of eight on the 22nd ult., and notices have been served upon all members of the technical staff, and, in consequence, the executives of the organisations concerned take a serious view of the position created by such a challenge to the prestige of Joint Boards and Joint Industrial Councils. Southampton Corporation put into operation in July, 1920, the schedule of salaries and conditions of employment recommended by the N.J.B. for the technical staffs of electricity undertakings.

The decision of the Corporation is not applicable to any awards in operation, except those in respect of the electricity department, and the decision was come to without consulting, or endeavouring to obtain the views of the employees. In other undertakings where difficulties have arisen, an amicable settlement has been arrived at, either on the District or National Joint Board. Although the E.P.E.A. have addressed several communications to the Corporation upon the matter, no reply has been vouchsafed.

The E.P.E.A. referred the matter to the District Joint Board on the 27th ultimo, when it was decided to ask the Corporation to suspend the notices pending the consideration of the matter by the N.J.B. The E.P.E.A. look upon the matter as a blow aimed at the foundations of Industrial Councils and the National agreements promulgated by such bodies, which have proved their value to the industries concerned. The dispute can still be referred to the Board, and it is to be hoped that the wisdom of such a step will be seen by the Corporation.

Commercial Morality.

Mr. C. H. Wordingham, national president of the Junior Institution of Engineers, at the annual dinner of the Sheffield and District Section of the Institution, in the King's Head Hotel, Sheffield, on Friday, said the young engineers of to-day were having a bad time, and it must be difficult for them to know what to do. To the young man who could not get employment he would say, go abroad. There was more likelihood of getting a position of superior responsibility abroad than at home, because there was less competition owing to the fact that a good many people were not prepared to go abroad. As one who had had some experience in examining papers, he (Mr. Wordingham) found that the young man who had gone abroad possessed superior intelligence. In addition, the pay was very often better, and, at any rate, promotion would be more rapid. Continuing, Mr. Wordingham appealed to the young men of the profession to uphold the reputation of Englishmen in foreign countries for straight dealing. It was well known abroad, he said, that an Englishman's word was his bond, and in that respect he stood higher than other nations. He was not favourably impressed with the changes wrought in regard to commercial morality during the last fifteen years. He hoped his judgment was not warped by age, but it did seem to him that there was not the high standard of commercial morality among engineers that there was fifteen or twenty years ago. If that were true it was very regrettable, because a man who was not straight could not look everybody in the face, and he was doing a disservice to his profession and his country.

Mr. S. E. Fedden, president of the Sheffield Section of the Institution, proposing the toast of "The Institution," said that the membership was now 2 069—an increase of 215 over 1920. Referring to the slump in trade, he said its effects were perhaps felt more acutely in Sheffield than elsewhere, because not only were the whole population of the city engaged on war work, but a large number of people had come into the city during the war. Their own country was not alone in its industrial troubles; the whole world was out of gear, and, until general action was taken to remove the obstacles to international trade, he could not foresee any improvement in trade. Some European countries had paper money which could not be negotiated outside their own borders. There could not be a revival of international trade until financial confidence was established. At home, too, they must have confidence. Labour should remove the canker of declining to give a fair day's work for a fair day's wage. Sacrifices should be made by all sides. The position was desperate for thousands of their citizens, and it could only be remedied by desperate measures.

Electrical Developments in Poland.

In a recent article in the "Manchester Guardian Commercial" it is stated that the need for the application of electricity in Poland on a larger scale than hitherto is making itself more and more felt. A special Electrobank has been lately organised, with a subscribed capital of 150 milliard marks, for the purpose of developing electricity supply. It has acquired patents and concessions for building and exploiting electric railways, tramways, power stations, &c. The bank is forming special companies for the management and financing of these undertakings. The Electrobank is in possession of the majority of shares of the first Polish electric lamp factory of Cyrkon. The building of a suburban electric railway between Warsaw and Modlin is in progress, and the line will, it is stated, be opened for traffic this spring. This is intended to be the beginning of a programme for the construction of a suburban network of electric railways round the capital. The bank has taken steps to exploit the water power of Silesia, and plans for the construction of hydro-electric stations on the Rivers Sau and Dunajec have been presented to the Ministry of Public Works for approval. Together with four other Polish banks, the Electrobank has formed a concern for taking over from the Government the telephone factory in Warsaw. Under the title of "Polish Electrical Undertakings Brown-Boveris Companies," a new joint stock company has been formed to take over the Warsaw branch of Brown, Boveris & Company. It is proposed to manufacture dynamos, motors and other electrical machinery in Poland, and the company has acquired large estates in the vicinity of Warsaw.

Electricity Supply.

The Propaganda Sub-Committee of Glasgow Electricity Committee have been instructed to report upon the feasibility of hiring out electric motors for manufacturing and industrial purposes.

The Disposals Committee of the Ministry of Munitions have agreed to cancel £141 000 of the loan of £150 000 to Rotherham Electricity Committee in connection with the construction of the new power station erected during the war.

The Electricity Commissioners, being of opinion that the sum of £2 500 for the conversion of boilers at Hackney generating station for the burning of oil fuel should not be made the subject of a loan, the Council has decided to proceed with the work and to pay for same out of the reserve fund.

After a three hours' discussion last Thursday on the electricity undertaking, Hull City Council decided to disband the old Electricity Committee and to elect a fresh one of eight members. Seven of these served on the old committee, from the chairmanship of which Ald. Pybus recently resigned. The facts of the situation were given in our last issue.

Hackney Electricity Committee have now completed the arrangements for the Electrical Exhibition they propose to hold from April 24 to 29, and inform us that the whole of the space has been taken up promptly by a number of representative firms, who will together display all the practical apparatus available to-day for lighting, cooking, heating and power in the home.

In connection with the scheme for the reorganisation of electricity supply in South-East Lancashire, which was recently investigated by the Electricity Commissioners, the organising committee have now agreed to accept the decision of the Commissioners in any appeal made to them, provided it does not involve the constituent authorities of the committee in any capital expenditure they may be unwilling to incur.

A recommendation by the Leeds Electricity Committee to the City Council that £1 600 should be paid to a firm of contractors, over and above the fixed contract price, to make good, to a certain extent, a loss sustained because of increases in wages and in the prices of material since the agreement was entered into, has been rejected on the ground that it would be setting up a vicious precedent, and the matter has been returned to the committee for further consideration.

We are glad to learn that the scheme for the reorganisation of electricity supply in the North-West Midlands Electricity District is not to be an exclusively municipal one. The Midland Electric Corporation for Power Distribution, which owns an important supply undertaking, and has done very useful pioneering work, will have a larger representation on the proposed Joint Authority than any other individual undertaking. The Joint Authority will acquire the generating stations, but the supply powers of the various undertakers in their existing areas will not be affected.

Responding to the toast of "The Town and Trade of Skipton," at the annual dinner of the Skipton Tradesmen's Association last week, Mr. J. W. Broughton (chairman of the Urban District Council), at the request of the chairman, made reference to the Council's electricity scheme. The Electricity Commission, Mr. Broughton stated, had practically approved the Council's scheme, and had authorised the borrowing of £11 800 for the expenses of the distributing mains and stations in the town. The old Grammar School would be used as a sub-station, and electricity would be supplied by Keighley Corporation. The Commissioners' approval of the Council's agreement with Keighley was held over, pending the completion of the local scheme for the reorganisation of electricity supply.

The Lord Mayor of Cardiff, Councillor F. H. Turnbull, addressing the Cardiff Rotary Club on Monday, replied to the protests in the Press against the allocation of £15 000 of the electricity department surplus profits to the reduction of the rates, instead of it being applied to the reduction of charges to electrical consumers. He said that the £15 000 did not represent sums provided out of the rates to meet deficits on the electricity undertaking in the past. But even if all such deficits had been repaid, he would still claim that the ratepayers were entitled to relief from the profits, on the ground that the undertaking itself was set up in the first place for the ratepayers generally; the money to establish it had been provided at a cheap rate on the credit of the ratepayers, and it was only fair to make them some return. Although the tramways had a trading loss for the past half-year, owing to high wages and coal prices, the electricity and tramways undertakings were both flourishing concerns, and in the twenty-two years of their existence 55 and 49 per cent. of the capital respectively had been set aside for redemption.

New Schemes and Mains Extensions.

Barnstaple Electricity Committee are applying for sanction to borrow £2 341 for condensing plant at the electricity works.

Watford Electricity Committee have applied for sanction to borrow £38 940 for extension of plant at the electricity works.

Derby Electricity Committee recommend the Town Council to apply for sanction to borrow £11 000 for new plant and extensions.

Harrogate Town Council has received sanction to a loan of £3 250 for h.t. mains.

The Electricity Commissioners have decided to issue a Special Order for providing electricity supply in Cookham and Cookham Dean.

Matlock Town Council are to lodge a protest with the Electricity Commissioners against being included in the North-East Midlands electricity district.

A municipal scheme for lighting the town of St. Heliers has been adopted, and application is to be made to the States for permission to raise a loan not exceeding £100 000.

The Electricity Commissioners have made special orders to authorise (1) Risca, (2) Mynyddislwyn, and (3) Bedwas and Machen Urban Councils to supply electricity in their respective districts.

Croydon Corporation Electricity Committee has decided to expend £2 400 out of Reserve and Renewals on a pump and repairs to two cooling towers, and £23 000 out of capital for a new boiler and equipment.

The recommendations of Birmingham Electricity Committee to extend the supply cables to the outside areas on the east and south side of the city, mentioned in our last issue, were approved by the City Council on Tuesday.

Newark Town Council have decided to apply for powers to supply electricity. A revision of the scheme submitted in November, 1920, has resulted in a reduction in the estimated cost from £200 000 to £140 250.

The Electricity Commissioners have sanctioned a loan of £80 000, on account, in respect of the Accrington scheme of electricity extension. The Commissioners add that they will be prepared to consider the sanction of any further sum when the actual cost of the work intended has been ascertained.

Growth of Liverpool Electricity Undertaking.

It is estimated that users of electricity in Liverpool will benefit to the extent of £227 000 by the reductions in electricity charges announced in our issue of the 10th inst. Since 1913 the demand for electricity has grown from 37 765 000 to 88 188 000 units. In his report Mr. H. Dickinson, the city electrical engineer, states that the load is growing so rapidly at the Lister Drive power station that it may be necessary to add to the generating plant this year. Provision has been made in the estimates to cover the cost of one generating set. The maximum load at present is about 14 000 kW, and when the plant on order is in operation this station will be capable of dealing with a load up to 50 000 kW.

Good progress is being made with the erection of a second generating set at Lister Drive No. 3 power station. Alterations have been in progress at several of the sub-stations to provide for the rearrangement of plant and additional switchgear. An additional 1 500 kW rotary converter has been put into service at both the Paradise-street and Fairclough-lane sub-stations. Provision has been made in the current estimates for four 1 500 kW rotary converters which will be installed in sub-stations, and for an auto-rotary sub-station in the Walton Town Hall or adjacent district. Provision will also be made for the installation of transforming plant and switchgear for static sub-stations on consumers' premises, and also additional switchgear in sub-stations. Some further provision will have to be made in the outlying districts to meet the increasing demands. The h.t. mains from Paradise-street sub-station to the Herculaneum Dock, for the supply to the Dock Estate, are to be completed.

Application is to be made by Liverpool Corporation for sanction to borrow £200 000 for the provision of a sub-station, electrical plant, &c.

In regard to Bootle, the transference of the Bootle undertaking will not involve any immediate change in present arrangements, but the intention of Liverpool Corporation is ultimately to change the whole system to three-phase. As Liverpool contemplate the erection at an early date of a new station to meet the increasing demands, the decision as to the closing of the Bootle station will probably be deferred. The Liverpool Corporation have run to the boundary of Liverpool and Bootle two 3 sq. in. 6 600 V three-phase cables, and Bootle Corporation have extended the mains from the boundary to Marsh-lane station, and these mains will be sufficient for some time to come to meet the demands of Bootle.

Obituary.

We regret to record the death, which took place on Feb. 27, at his residence, Cleveland House, Gainsborough, of Mr. James Marshall, chairman and managing director of Marshall, Sons & Company. Mr. Marshall was in his 86th year.

We regret to announce the death last week from an accident in the hunting field of Mr. Randal Beresford Slacke, manager and publisher of "The Engineer." Mr. Slacke, who was a son of Sir Owen Slacke, joined the staff of "The Engineer" in the spring of 1919 to fill the place occupied for many years by Mr. Sydney White, and brought to his work a long experience of commercial engineering. He was for some years manager of the London office of Messrs. Galloways, but left in January, 1917, to take a commission in the Royal Engineers, and after serving for a few months with Inland Waterways and Docks he was lent to the Admiralty for duty as Deputy Assistant Director and Assistant Director of Materials and Priority.

It is stated that Metropolitan-Vickers Electric Company are considering a superannuation scheme for their staff, with contributions from the employees and the company.

Electric Traction.

The Ministry of Transport has decided to hold an inquiry on the subject of CENTRE POLES IN PRINCES STREET, Edinburgh.

Over a MILLION MORE PASSENGERS were carried on the L.C.C. tramcars during the two weeks ended Feb. 15th, compared with the corresponding period last year.

It is estimated that five million PASSENGERS were CARRIED by the Underground railways ON PRINCESS MARY'S WEDDING DAY last week. On the L.C.C. tramcars about two and a half millions were carried.

HULL Tramways Committee have decided to contribute £10 000 out of the Tramways' compensation account to the relief of the rates. The chairman, in making the announcement, said he did not agree with the principle of applying profits to the relief of the city rates, but in the exceptional circumstances, and with the rates 20s. in the £, he thought it only fair to make the proposal.

Proposals for varying THE 1919 AGREEMENT were considered by the Joint Industrial Council of the Tramway Industry last Thursday. The chief question considered was the suggestion to abolish the 48-hour guaranteed week. Common ground was reached upon several points, but equally important matters were adjourned until this week. It is understood that the crisis that had arisen on the question of the guaranteed week is regarded as practically over.

The strike of the NEWCASTLE-ON-TYNE tramway men still continues. A ballot has been taken on the terms offered by the Tramways Sub-Committee on Sunday, but as we go to press the result is not yet to hand. The terms offered are :—(1) That the working hours shall be forty-eight, and in all respects the terms of the National Agreement shall be observed. (2) The rates of wages to be as at present and to be subject to the National Wages Agreement.

The Minister of Transport has extended for a further year from Aug. 28, 1921, the periods allowed by the SWANSEA CORPORATION LIGHT RAILWAYS (EXTENSIONS) ORDER, 1914, for compulsory purchase of lands for railway No. 2, and for completion of railways 1, 2 and 3, and has also extended for a further year from Sept. 14, 1921, the time allowed by the SWANSEA CORPORATION LIGHT RAILWAYS (EXTENSIONS) (REVIVAL AND EXTENSION OF TIME) ORDER, 1918, for compulsory purchase of lands for railways 1 and 3.

At SCARBOROUGH recently two local tram drivers, T. Ramsbottom and T. Morley, were fined 5s. for exceeding the speed limit of four miles per hour down Eastborough on Feb. 4. The limit of four miles per hour between Leading Post-street and Palace Hill is fixed by the Board of Trade regulations, and the police evidence showed that one driver was driving at the rate of nine miles an hour and the other at the rate of 9⅜ miles an hour. Both defendants urged that it was far more dangerous to drive down the hill at four miles an hour than at eight miles, as with the latter speed they were able to use the electric instead of the hand brake. They said that when the rails were greasy it was impossible to drive at four miles an hour. The attention of the Board of Trade is to be drawn to the statements made by the drivers, so that some modification may be made in the regulations if necessary.

Social Notes.

The tenth annual dinner of the staff of FERRANTI, LTD., was held on Friday, March 3, at the Midland Hotel, Manchester, and was followed by a dance. The chairman of the company, Mr. A. W. Tait, received the guests and presided over the dinner. The arrangements were admirably carried out, and after an excellent dinner the usual toasts were interspersed with musical items, including the song "My Old Shako," with chorus, by Mr. Campion, rendered for the tenth year in succession, and now known as the Ferranti anthem.

The G.E.C. TRAVELLERS' DINNER was held on Friday, Feb. 24, at the Old Falstaff, in Cheapside. Mr. H. W. Roberts (London sales manager) occupied the chair, and was supported by Mr. M. J. Railing (general manager of the G.E.C.), Mr. L. C. Gamage (secretary), and several of the London departmental managers. After interesting and humorous speeches by the chairman, Mr. Railing, Mr. Gamage, Mr. Riley, and Mr. Joyce, a select musical programme under the direction of Mr. Ashman was given, and the meeting dispersed in excellent spirits.

On the 1st inst. the ELECTRICITY SUPPLY COMMERCIAL ASSOCIATION (Greater London Division) held their second Bohemian concert at Anderton's Hotel, and Mr. D. C. Clark (Chairman of the London Divisional Council) occupied the chair. We learn from the General Secretary (Mr. G. R. Smith) that the influence of the Association is still increasing, but, as its activities are not usually attended by any great degree of publicity, the practice of holding these occasional concerts has been resorted to, with the object of calling attention to the Association and increasing the spirit of *camaraderie* amongst its members and the classes of workers which it represents. The entertainment provided at last week's concert spoke well for the organising ability of Mr. T. J. Archer (Secretary, Greater London Division) and Mr. S. George (hon. musical director), and, as the entertainment was, in our opinion, at least equal to that given in some public entertainment halls for a higher charge, similar functions organised in future by the Association should be well attended.

The marriage of Mr. CHRISTOPHER WILSON, manager of the General Electric Company's Osram Lamp Works, to Miss Jessie Wilson, sister-in-law of the bridegroom, took place recently at the church of St. Sepulchre, Holborn.

Business Items, &c.

The address of A. W. BEUTTELL, LTD., is now 53, Victoria-street, S.W.1. Telephone, Victoria 7789.

The URBAN ELECTRIC SUPPLY COMPANY, LTD., have transferred their offices and showrooms at Grantham from East-street to 34, St. Peter's-hill.

The name of the Union Cable Company, Ltd., was inadvertently omitted from the advertisement of the CABLE MAKERS' ASSOCIATION which appeared on page xxxvii. of our last issue. We are asked to state that the Union Company is a member of the Association.

ELECTRICAL COMPONENTS, LTD., have taken Nos. 88 and 89, Great Charles-street, Birmingham, premises adjoining those already occupied by the firm. After alterations, the new premises will be opened as warehouses and showrooms. The company announces a further reduction in their manufacturers.

A large number of orders for the "Invincible" (wet) air filter have been executed by WM. GRICE & SONS, of Birmingham, for electricity supply stations, both municipal and company owned. Contracts have also been carried out for collieries, iron and steel works, &c., and, in addition, a number of the machines have been exported to France, India, and elsewhere.

The WESTINGHOUSE MORSE CHAIN COMPANY have added to their range of inverted tooth chain drives a 1¾-in. pitch. Westinghouse Morse silent rocker-joint chains are therefore now made in the following twelve pitches :—½ in., ⅝ in., ¾ in., 0·9 in., 1 in., 1·2 in., 1·25 in., 1·5 in., 40 mm., 1¾ in., 2 in., 3 in. Each of the above sizes is made in two distinct types, and in widths according to pitch from ¾ in. to 30 in

ALFRED DANKS, LTD., of Gloucester, have purchased the Emlyn Works, to which, it is understood, the operations now carried on at the Westgate Iron Works in the name of Alfred Danks, Ltd., and the Kingsholm Foundry under the style of J. M. Butt & Company, will be transferred. The Emlyn Works were formerly utilised as an iron foundry and engineering works by Mr. C. D. Phillips, from whom they were purchased three years ago by the Avon Malleable Iron Foundry, Ltd. This firm went into liquidation, but the liquidators have continued to run them as a going concern until their purchase by Danks, Ltd.

Personal and Appointments.

Mr. HORACE WARREN has been appointed superintendent of the Sydney station of the Eastern Extension, Australasia & China Telegraph Company.

Mr. ALEX. SPENCER has been appointed vice-chairman of the Metropolitan-Vickers Electrical Company, Ltd., in succession to the late Sir Francis Barker.

Mr. C. O. MAILLOUX, consulting engineer and president of the International Electrotechnical Commission, has been raised from the rank of chevalier to that of officer in the French Legion of Honour.

Mr. H. J. CASH has been nominated a representative of the Institution of Electrical Engineers on the Council of the British Electrical Development Association in the place of Mr. B. Welbourn, who is unable to attend the meetings.

TONBRIDGE Urban Council has appointed Mr. F. SPRINGATE, installation inspector, assistant engineer at the electricity works, in succession to Mr. E. G. STAYGLE, who has been appointed assistant engineer at the Worthing Electricity Works.

Mr. WILLIAM STEPHENS has been appointed general manager of the Electrical Federation (Victoria), the successor of the Electrical Traders' and Contractors' Association of Victoria. Mr. Stephens has held during recent years the positions of editor of the "Industrial Australian" and editor of the "Commonwealth Engineer."

Mr. H. C. ANTHONY, who has been on the Newcastle office staff of Merz. & McLellan for many years, has relinquished his engagement with the firm in order to take up the appointment of constructional engineer to the Shanghai Municipality. Mr. Anthony was entertained by his colleagues before leaving Newcastle and presented with a token of their friendship and esteem.

Mr. CHARLES I. BAKER, traffic superintendent and chief executive officer of the Blackpool Corporation Tramways, has been appointed general manager of the Ashton-under-Lyne Tramways in succession to the late Mr. ERNEST HOLT. A native of Tynemouth, Mr. BAKER first held an appointment with the Newcastle Corporation Tramways Department. Since he came to Blackpool great developments have taken place in the department, the revenue of which has grown from £58 699 to £284 472, whilst the passengers carried have increased from 9 013 540 to 35 700 000.

Sir WILLIAM CLEGG is to receive the Freedom of the City of Sheffield on April 21, to mark the anniversary of his 70th birthday. Ever since 1896, when, on the introduction of the municipal tramway service in Sheffield, he was elected chairman of the first Tramways Committee, Sir William's services to the city can hardly be overestimated. In 1898 he accepted the office of Lord Mayor. In 1902 he was elected chairman of the Education Committee, and since the inception of Sheffield University he has represented the Sheffield Education Committee on the University Council. In 1912 he received from the University the Honorary Degree of Doctor of Laws, and in 1918 was made a C.B.E. in recognition of his work as chairman of the local munitions tribunal.

Institution Notes.

Dr. C. Chree has been elected president of the Royal Meteorological Society for the ensuing year.

At the annual meeting of the Royal Astronomical Society Prof. A. S. Eddington was elected president for the ensuing year.

The annual conversazione of the Institution of Electrical Engineers will be held at the Natural History Museum, South Kensington, S.W., on Thursday, June 29.

Among the fifteen candidates selected by the Council of the Royal Society for election as fellows are :—Dr. F. W. Lanchester, Prof. Geo. A. Schott and Sir Alfred Yarrow, Bart.

A new List of Members of the Institution of Electrical Engineers has just been published. Members desirous of having a copy can obtain it on application to the Secretary.

Mr. W. C. Acfield, O.B.E., of Derby, has been elected president of the Institution of Railway Signal Engineers for the year 1922. The hon. secretary is Mr. M. G. Tweedie, G.W.R. Signal Department, 80, Caversham-road, Reading.

The annual meeting of the Elektrotechnischer Verein was held in the Technische Hochschule, Charlottenburg, Berlin, on Tuesday, Dr. Adolf Franke presiding. It was reported that the membership of the Verein was 2 450, compared with 2 194 at the end of 1920. State Secretary Dr. Bredow was elected president for 1922.

The Council of the Institution of Electrical Engineers have agreed to the inclusion of the counties of Flint, Denbigh, Merioneth, Montgomery, Carnarvon and the Island of Anglesey in the area governed by the North-Western Centre. The North-Western Centre have agreed to allocate this area to the Liverpool Sub-centre of the North-Western Centre.

The annual Report of the Institution of Mechanical Engineers for the year 1921 shows the total membership to have increased by 491 to 7994. The accounts for the year show a balance of revenue over expenditure of £50. The total assets amount to £161 400, and deducting £34 025 debentures, and other liabilities, together with the total amount of the four reserve funds (£57 408), there is a credit balance of £66 285. The report contains a summary of the year's work of the five research committees.

The annual dinner of the Birmingham and District Electric Club was held at the Grand Hotel, Birmingham, on Feb. 24, Mr. Norman Deykin (president) being in the chair. Councillor H. K. Beale (chairman of the Corporation Electric Supply Committee), replying to the toast of "The City of Birmingham," remarked that enormous developments had taken place in the production of electricity in Birmingham during the past twenty-five years. In 1895 half a million units of electricity were generated, as compared with 137 millions last year. By the time the Committee had developed all their schemes the city, he thought, would be the largest generating authority in the country.

At the first ordinary meeting of the newly-formed Electrical Society of Glasgow the constitution framed by the special committee was, with certain modifications, approved by the members. A committee was elected representative of the electrical contractors, supply authorities, manufacturers, factors, and consulting engineers, with Mr. R. A. Ure, of Allan Arthur & Ure, as chairman, and Mr. G. Morgan, deputy engineer and manager, Glasgow Corporation Electricity Department, as vice-chairman. The objects of the society are the promotion of the interests of its members, their advance in new, progressive and successful business methods, the interchange of technical information relating to electrical practice, and to afford members an opportunity of co-operating in social, commercial and industrial development. Membership of the society is open to all engaged in the electrical industry. Mr. R. B. Mitchell, engineer and manager of the Glasgow Electricity Department, stated that the organisation should act as a feeder to the Institution of Electrical Engineers, the parent body of all electrical men.

Exhibition Notes.

Owing to the depressed state of trade, the directors of the British Trade Ship have postponed the scheme until the latter end of 1924.

At the International Model Housing Exhibition, to be held in Turin from April 8 to 21 inclusive, there will be a section devoted to electric lighting, heating and domestic appliances. The address of the Secretary is 8, Via Goito, Turin.

The electrical industry is well represented at the Ideal Homes Exhibition, which was recently opened by Lord Provost Hutchison in Waverley Market, Edinburgh. The Corporation Electricity Department have taken a large central stand, and a considerable number of electrical contractors in Edinburgh have combined in their association to make an official exhibit on a large double stand.

A booklet, entitled "Central Station Voltages and Charges," issued by S. Rentell & Co., at 1s. net, contains in a condensed form some of the useful information given in our own Electricity Supply Tables, the details being confined to the name of engineer, the voltage of supply, system, and prices per unit. As far as we can see, the information given is substantially correct, though it is a little unfortunate, from this point of view alone, that the prices in many cases have now been revised in the downward direction.

Telegraph and Telephone Notes.

The Swedish telegraph service in 1921 showed a surplus of 19 070 000 kroner.

It is announced that the Swedish Cedergren Telephone Company, which owns the Warsaw telephone system, comprising about 33 000 subscribers, will be taken over by a new concern, which will acquire the Warsaw system as well as the State systems in Looz, Lublin, Lemberg, Bialistok, Sosnowice, and Drobowiez, and gradually other systems. The combine has received a concession for 25 years.

A Reuter's message from Berlin states that, according to the local newspapers, the German Atlantic and German South-American Telegraph Companies have concluded an arrangement with the American telegraph companies, whereby the German companies will be enabled to resume cable traffic. The German companies will work the Emden-Azores section, while the Azores-New York section will be worked in conjunction with the American concerns.

Bishopsgate, the new London telephone exchange, was opened on Saturday, when 750 numbers from Clerkenwell, City, Central, London-wall, Avenue, and Bank were transferred, while by the end of the month another 500 will follow. The new exchange, which is in the Clerkenwell Exchange Buildings, Ironmonger-row, Old-street, is temporary, pending the equipment of a new building in the vicinity of Bishopsgate-street. It is equipped for 1 500 numbers.

Wireless Notes.

Mr. Walter Addy, of Buxton, has given his private wireless installation, which has a 1 200 miles radius, to the Town Council. This will enable the council to receive each morning weather reports from the Meteorological Office.

The Marconi wireless high-speed service with France which was affected by the recent flooding of an underground cable conduit in Cheapside, has now been restored. There is also no longer any delay on Marconigrams to North and South America, Australasia, Spain, &c.

Electrical Machinery for British Malaya.

There is a growing demand for electrical machinery in the British portion of the Malay Peninsula. Imports in 1920 were valued at £241 923, against £60 525 in 1917, and exports increased to £51 002, against £18 795 in 1917. Though classified as exports, the electrical goods sent out of the Straits Settlements do not, to any great extent, leave the Peninsula, but find their way into the Federated and Unfederated Malay States—in 1917 to the value of £14 823; in 1918, £10 317; in 1919, £22 818; and in 1920, £32 497.

Of the machinery imported in 1920, the United Kingdom supplied £123 122, against £50 430 in 1919; the U.S.A., £46 985 (£74 593); Canada, £25 398 (nil); Japan, £11 963 (£611); Holland, £8 675 (nil); Hongkong, £7 816 (£592); Italy, £5 724 (£857); Denmark, £4 777 (nil); France, £1 773 (nil); Australia, £1 024 (£1 074); and China, £898 (£4 651).

It is gratifying to note that the imports from the United Kingdom, which were in 1919 some £15 000 below those of the United States, were in 1920 £76 000 above the American figures.

In the Federated Malay States the supervision of electrical machinery is entrusted to the Senior Warden of Mines, and, according to Mr. A. R. Mynott's report, the number and capacity of the installations of generating plant in 1918, 1919 and 1920 were as follows :—106 (9 360 kW), 109 (9 544 kW), and 110 (10 376 kW). In addition there were 45 self-contained low-voltage lighting plants in private houses, and about 900 kW of plant were in course of erection at the close of the year. The motors employed aggregated 10 047 kW, against 9 067 kW in 1919 and 8 911 kW in 1918.

The generating plant employed in 1920 was classified as follows :—Mining, (power) 9 551 kW, (light) 217 kW; agriculture, (power) 56 kW, (light) 214 kW; general, (power) 109 kW, (light) 170 kW; and Government, (power) 331 kW, (light) 2 469 kW, making a total of 13 117 kW.

In the report for 1920 of the Director of Public Works, it is stated that during the greater part of the year many houses in Kuala Lumpur, the capital of the Federated Malay States, were without meters, but by December meters were installed in all the houses. The supply in the town, considering the shortage of material and the condition of the plant, was well maintained, and only one serious stoppage took place. Sale of current brought in £31 019, against £23 567 in 1919.

Unbreakable Glass.

A correspondent of the "Times Trade Supplement," writing from Prague, states that at one of the oldest of the glass factories in Bohemia, after many years of experiment, a glass has been produced which, it is claimed, is absolutely unbreakable. Receptacles made from the material, it is said, can be thrown about, made red hot and then put into cold water, and yet do not break. It is claimed that hammers made from the material can be used for ordinary purposes. It is difficult to cut even with a diamond, while the ordinary carborundum stones are useless for the purpose. It is important to note, however, that this invention can only be placed upon a commercial basis when a special kind of sand has been found and is available in large quantities. At the present time this sand is said to exist only in the neighbourhood of Dresden, in comparatively small quantities.

Miscellaneous.

Among the first ALLOCATIONS OF MONEY from the fund constituted under Section 20 of the Mining Industry Act, 1920, is £12 000 to provide for important research work in connection with (*a*) miners' safety lamps, both flame and electric, and (*b*) coal dust dangers; also the preparation of abstracts of research data both in this country and abroad.

The Board of Trade have issued an Order exempting from the GERMAN REPARATION (RECOVERY) ACT, 1921, any "publication in the German language which is proved to the satisfaction of the Commissioners of Customs and Excise to be a periodical publication of a German learned society, or other scientific or philosophical periodical publication."

The fourth annual report of the WORKS COMMITTEE of the CHLORIDE ELECTRICAL STORAGE COMPANY shows that much useful work has been done by the committee for the welfare of the employees. Grants from the Employees Benefit Fund have been made in several necessitous cases, and the recreation of the staff has also been well looked after. At the end of the financial year a sum of £5000 was voted to the Employees' Benefit Fund by the shareholders.

A SHOPPING WEEK AND TRADE PAGEANT is to be held in Cardiff from May 1 to 6, under the presidency of the Lord Mayor, Councillor F. H. Turnbull. The competitions will include window displays in various classes and sections, a free gift scheme, spotting competitions, in addition to special prizes which are being offered by various wholesale houses. One of the special features is the trade pageant. Prizes are being awarded for the best advertisement or display of goods by retailers as well as wholesale houses.

The FINSBURY TECHNICAL COLLEGE OLD STUDENTS' ASSOCIATION, whose recovery from moribundity we noticed a short time ago, has now issued a magazine, which not only contains a large amount of information of interest to past and present students, but is inherently a sufficient indication that the Association is going very strong. With it is published a list of members, and, more striking still, a list of known non-members. We should suggest that this list be sent to every defaulter concerned, when we feel sure that the jump in the membership curve would be very satisfactory.

Catalogues, Price Lists, &c.

Nos. 5 and 6 of "TRANSFORMER ABSTRACTS," published by Johnson & Phillips, deal respectively with the despatch, installation and maintenance of O.I.S.C. transformers, and the "drying out" which must precede the installation of a transformer plant.

THE JEARY ELECTRICAL COMPANY have just issued the tenth edition of their L. and B. catalogue, containing illustrations and prices of the chief accessories used with electric bells, fittings, telephones, also electric light accessories, conference lamps, cables, wires, &c.

The A.C.E.C. (Ateliers de Constructions Electriques de Charleroi) have resumed the publication of their interesting "Bulletin," which, owing to German occupation of their country during the war, had to be suspended for five years. The January number, just to hand, contains an article, excellently illustrated, on the company's works before, during, and after the war.

JOHN M. HENDERSON AND CO. are among the few firms who are sufficiently enterprising to publish their catalogues in other than the English language. We congratulate this company on the illustrated booklet they have lately published of their electric overhead travelling crane, in which full explanations are given in English, French, Italian, and Spanish.

The delicate and varied colours of the SILK LAMP SHADES manufactured by Charles Selz are well shown in a coloured leaflet we have recently received from this firm. Thirty different designs of lamp shades are shown, and among the latest novelties put on the market by Mr. Selz is a combined trinket box, pincushion, watch-stand, electric light stand and shade carried out in beautiful colourings.

The catalogue of GALSWORTHY, LTD., contains a number of very choice designs of electric light fittings, table and candle lamps, in a variety of finishes. The company specialise in adapting glass or china ornaments and metal fittings for electric lighting. The designs in the present catalogue are registered, and though the fittings are intended for electric lighting purposes, they lend themselves readily to treatment for other methods of lighting.

The various types of PRESCOT METERS manufactured by the British Insulated and Helsby Cables, Ltd., are described in Booklet No. P172, which is being circulated by the firm. Among the meters which are fully described and illustrated are the Prescot a.c. energy meter—house service type P.A., two wire, single phase; the a.c. prepayment meters—"Prescot" type, two wire, single-phase, up to 250 V, and electrolytic prepayment meters for direct current, types "B" and "C."

CAMPBELL & ISHERWOOD, manufacturers of electrical machinery for marine and industrial use since 1898, have recently published a new illustrated catalogue of their various manufactures, including "C and I" d.c. generating sets, up to 250 kW, with either steam or combustion engines, d.c. and a.c. electric motors, electric cranes, capstans and winches, patent silent electric hoists for ashes, baggage or warehouse use, electric portable tools, noiseless gearing, in paper or raw hide, up to 3ft. diameter, and machine cut gearing—spurs, bevels, spirals, &c., up to 8ft. diameter.

Tenders Invited and Accepted.

UNITED KINGDOM.

LEEDS EDUCATION COMMITTEE. March 13.—Electric wiring work for twelve months. Forms of tender from the Architects' Section, Education Department, Calverley-street, Leeds.

DUBLIN GUARDIANS. March 15.—Supply of electric fittings, &c., for three months. Forms of tender can be obtained at the Union Offices, 1, James'-street, Dublin.

HAMPSTEAD (LONDON) BOROUGH COUNCIL. March 15.—Supply of various stores for six or twelve months, including electrical engineers' stores and oils for the electricity station. Form of tender, &c., from the Town Clerk.

BLACKPOOL CORPORATION. March 16.—Supply, delivery and erection of h.t. switchgear and switchroom equipment for West Caroline-street power house, and Bispham and Cleveleys sub-stations, suitable for controlling 6 600 V, three-phase, 50 periodicity supply (section 4); h.t. armoured transmission three-core cables suitable for above supply; 12 miles 0·2 sq. in. three-core feeder, 5 miles 0·175 sq. in. three-core feeder, and 8½ miles six-core pilot cable (section 5). Particulars from the Borough Electrical Engineer and Tramways Manager, Mr. C. Furness.

BELFAST ELECTRICITY COMMITTEE. March 16.—Supply of various materials, including v.b. insulated cable, v.i.r. cables and wires, electrical accessories, lamps, carbon brushes, bitumen, rubber tapes, fuse wires, troughing, meters, m.d. indicators, cut-outs, &c. Forms of tender from the City Electrical Engineer.

DUBLIN ELECTRICITY SUPPLY COMMITTEE. March 16.—Two water-tube boilers, &c. Specifications from the City Electrical Engineer.

BRISTOL DOCKS COMMITTEE. March 17.—Four 30 cwt. movable electric jib cranes. Specification, &c., from the Engineer, Avonmouth Docks.

EDINBURGH CORPORATION. March 20.—Auxiliary plant and pipe-work for Portobello power station. Specifications from Sir A. B. W. Kennedy, 17, Victoria-street, Westminster, S.W. 1.

WEST SUSSEX COUNTY MENTAL HOSPITAL, CHICHESTER. March 24th. Six months' supply of electric lighting sundries. Particulars from the Clerk and Steward at the hospital.

CHEADLE AND GATLEY U.D.C. April 3.—Extra high-pressure, medium-pressure, and low-pressure mains and street-lighting accessories. Particulars from the Council's Engineer, Mr. C. H. Wordingham, either from 11, Mosley-street, Manchester, or 7, Victoria-street, Westminster, London, S.W.

LONDON COUNTY COUNCIL. April 10.—(*a*) Ash-conveyor of the water immersed, drag-link type; (*b*) ash-hopper. Both for Greenwich Power Station. Particulars from the Clerk of the Council, County Hall, Spring Gardens, S.W.

SOUTH AFRICA.

STANDERTON (SOUTH AFRICA) MUNICIPAL COUNCIL. March 24.—H.M. Senior Trade Commissioner in South Africa reports that STANDERTON MUNICIPALITY invite tenders for electric power plant, including two water tube boilers (4 600 lb. per hour evap. capacity), two feed pumps, feed tanks, two 100 kW steam alternators (three-phase alternators, 0·8 power factor, frequency of 50 and voltage of 3 300 between phases), switchboard, distributors, &c.; the d.c. two-wire system is to be altered to the three-phase four-wire system, 240 and 420 V. Specification and blue prints may be seen on application at the D.O.T., 35, Old Queen-street (Room 49), up to March 11, after which date it will be available for loan to firms in the provinces. Tenders to the Town Clerk's Office, Standerton.

MUNICIPAL COUNCIL OF JOHANNESBURG. March 27.—Supply and delivery of spares for Brill tramcar trucks.

BULGARIA.

BULGARIAN DIRECTION OF POSTS AND TELEGRAPHS. April 3.—*Supply of the following telephone pole-line hardware: 36 000 straight supports for insulators (German type); 35 000 bent supports for insulators (German type); 5 500 fixing clamps; 6 500 yokes.

BULGARIAN GOVERNMENT. April 21.—*Switchboards.

YORK ELECTRICITY COMMITTEE have accepted the tender of the A. E. G. Company, of Berlin, for the supply of meters.

CLAYTON & SHUTTLEWORTH have secured a contract from the London County Council tramways for patent boilers of 70 000 lbs. steaming capacity, able to develop 10 000 H.P.

LIVERPOOL Electric Power and Lighting Committee have accepted the offer of Belliss & Morcom for the installation at Charters-street Destructor Station of a 500-kW generating set.

Callender's Cable and Construction Company have secured the annual contract for the supply of cables and accessories to the LIVERPOOL Corporation for the year ending March, 1923. The City Council have also accepted the tender of the Metropolitan-Vickers Electrical Company for four 1 500-kW rotary converters, with switchgear, accessories, and spare transformer, &c.

GLOUCESTER City Council have accepted the tender of the ENGLISH ELECTRIC COMPANY, amounting to £22 414, for supplying, erecting and maintaining for twelve months two of their geared turbo-generators of 1 500 kW capacity each, with Cole, Marchant & Morley's condensing plant. Thirty-two tenders were received, twenty-six from British and six from foreign firms. The tender of Byard & Son, at £2 687, for building extensions was also accepted.

---

* *Particulars from the Department of Overseas Trade.*

Companies' Meetings, Reports, &c.

Midland Counties Electric Supply.

Presiding at the annual meeting of the Midland Counties Electric Supply Company on Tuesday, Viscount Chilston (chairman of the company) said that notwithstanding the coal strike and the trade depression, the output from the generating and distribution stations throughout the areas of supply of their two power companies largely exceeded that of the previous year. The total units sold amounted to 15 131 938, compared with 11 640 266 for 1920, and the number of consumers totalled 3 489 (3 098) The total load connected in the various power and lighting undertakings amounted to 19 611 kW (14 823 kW). The gross receipts of the power and lighting companies amounted to £167 561 (£129 323).

During the year steps were taken to obtain special orders for certain districts in the areas of supply of the power companies. It was found that whenever a supply was introduced in any of the small townships for power there was almost an immediate demand for a supply for lighting, which supply the power companies could not give at rates which were remunerative. Of the four applications made, two special orders had been granted and confirmed by Parliament, viz., (1) for Belper and district, and (2) Bedworth and Bulkington. The third order, the Wigston Magna and District Special Order, had been made by the Electricity Commissioners, approved by the Ministry of Transport, and only awaited confirmation by Parliament. The fourth order, dealing with the district between Hinckley and Tamworth, and including Atherstone, was delayed by the attitude of one or two local authorities.

The Derbyshire and Nottinghamshire Electric Power Company was still seriously prejudiced by the refusal of the Electricity Commissioners to allow that company to erect a new station on the River Trent. In July, 1920, the Council was permitted to erect a large station, but the turbine plant for that station was only ordered a few weeks ago, and the corporation was temporising with the situation by constructing a temporary station to deal with its own immediate requirements.

With regard to their traction undertaking, these had naturally suffered from the effects of the coal strikes and trade depression. Compulsory travelling was curtailed and pleasure travelling considerably diminished. The gross receipts for the year from the traction properties amounted to £112 676 against £117 562 for 1920. The number of passengers carried was 9 167 304 (11 949 134), and the car-miles run 1 148 130 (1 226 605). Taking the combined power, lighting, and traction undertakings, the gross revenue for the year amounted to £280 247, compared with £246 885, the increase being wholly due to the development of the electric supply business.

The revenue received by the company from its various subsidiary undertakings amounted to £65 602, against £58 194. After payment of administration expenses, there remained £60 296 available (against £53 697), and with the amount brought forward the total was £62 555, out of which the following appropriations and payments had been made: loan and debenture interest (less tax) £29 461; debenture and redemption account, £4 653; reserve, £5 000. Out of the balance of £23 440 it was proposed to pay a dividend on the ordinary shares at the rate of 4 per cent. per annum (less tax), leaving £2 440 to be carried forward.

County of London Electric Supply.

The report for the year 1921 of the County of London Electric Supply Company states that the net capital expended during the past year an account of the company's districts amounted to £195 749, and the net total expenditure amounted to £2 929 751 10s. After adding the balance from the last account, after payment of the final dividends on the preference and ordinary shares for the half-year ended Dec. 31, 1920, less income tax (£18 595), and the balance from revenue account No. II., after deducting generation and distribution costs, repairs, general establishment and other charges, and a proportion of salaries and wages (£342 201), there is a total amount available for the year of £360 795. From this sum has to be deducted interest on debenture stock and temporary loans to Dec. 31, 1921, less income tax (£64 384), amount written off expenses and discount on 1921 debenture stock issue (£25 000), amount carried to reserve for taxation (£20 000), amount carried to reserve for depreciation, renewals, &c. (£60 000), and amount carried to general reserve (£100 000), leaving £91 411 for distribution. Interim dividends have been paid, less income tax, on 65 000 six per cent. fully-paid preference shares for the half-year ended June 30, 1921, and on 75 578 ordinary shares for the same period at the rate of 5 per cent. per annum, which has absorbed £26 876, and leaves £64 535 for further distribution. The directors now recommend a further dividend on the 65 000 six per cent. fully-paid preference shares for the half-year ended Dec. 31, 1921, less income tax; and on 75 578 fully-paid ordinary shares for the same period at the rate of 11 per cent. per annum, less income tax, making 8 per cent. for the year. The last-mentioned payments will absorb £42 747 10s. and leave a balance of £21 787 10s. to be carried forward. Applications received during the past year amounted to the equivalent of 6 908 kW, making the total at Dec. 31, 94 000 kW; total units sold numbered 51 220 079, as against 49 553 223. The consumers supplied directly or indirectly by the company now number over 43 000. Mr. J. A. Hosker has been appointed to succeed the late Mr. J. Atherton on the board; Sir Bernard E. Greenwell, Bart., has also been appointed to a seat on the Board. In order to provide for the normal capital requirements of the company an issue of £500 000 seven per cent. redeemable debenture stock was made in October last. The issue was heavily over-subscribed. The directors propose to submit resolutions at the forthcoming annual meeting for dividing each of the existing preference and ordinary shares of £10 each into 10 shares of £1. As to the associated companies, the directors of the South London Electric Supply Corporation, Ltd., have declared a final dividend on the ordinary shares at the rate of 9 per cent. per annum, making 7 per cent. for the year. The directors of the Bournemouth and Poole Electricity Supply Company have declared a final dividend on the ordinary shares at the rate of 7 per cent. per annum, making 6 per cent. for the year. The business of the Coatbridge and Airdrie Electric Supply Company, Ltd., continues to progress.

Charing Cross, West End and City Electricity Supply.

In their report for 1921 the directors of the Charing Cross, West End and City Electricity Company state that the gross earnings of the West-End undertakings from sales of current, rents, &c., were £312 532, against £311 045 in 1920; expenses, including depreciation, were £212 116 (£208 214), and the net earnings, £100 415 10s. (£102 830). Adding the balance brought forward from the previous year (£12 391), and interest accrued for 1921 £5 506 10s.), the total available amounted to £119 313. After providing for interest on debenture stock (£17 829), and setting aside for depreciation £22 000, there was a balance of £79 483, out of which has been paid the dividend on preference shares for the year, amounting to £18 000, and an interim dividend for the first half of the year at the rate of 3s. per share on the ordinary shares, amounting to £12 000, leaving £49 483 to be dealt with. The directors recommend that a final dividend be paid on the ordinary shares for the second half-year at the rate of 6s. per share, making 9 per cent. for the whole year, absorbing £24 000, that £12 500 be carried to reserve, and that £12 983 be carried forward. The company has now connected to its West-End mains a total equivalent of 847 060 (30-W.) lamps: in lighting, 490 245; in heating, 104 481; and in motive power, 253 334 (10 147 h.p.).

The gross earnings of the City undertaking from sales of current, rents, &c., were £439 772, compared with £418 746 in 1920: expenses were £328 493 (£355 062), and the net earnings £111 279 (£63 685). Adding the balance brought forward from the previous year (£4 491), there is a total available of £115 770. After providing for interest on debenture stock, 6½ per cent. 5-year secured notes, loans, and advances (£47 889), there is a balance of £67 880, out of which has been paid the dividend on the preference shares, amounting to £18 000, leaving £49 880. The directors recommend that £32 181 be transferred to reserve, and that £17 700 be carried forward. The company has now connected to its City mains the total equivalent of 982 370 (30-W.) lamps: in lighting, 360 811; in heating, 164,233; and in motive power, 457 326 (18 391 h.p.).

W. T. Henley's Telegraph Works.

In the course of his remarks at the annual meeting of W. T. Henley's Telegraph Works Company last week, Mr. George Sutton (chairman and managing director), who presided, stated that the balance-sheet showed the falling-off in trade they had experienced, notwithstanding that the result of the year's working showed the largest net profit the company had made in its long history, and that the assets had a higher value compared with the liabilities. The item of creditors was down by £100 000 after deducting from the previous year's figures £100 000, which as he then informed them was the amount of a bank loan included. On the other side the debtors were down by £145 000, and the stocks by £179 000. Those items were a sure indication of the falling-off in business and the pace had been accelerating during the entire year. How, in spite of this fall in trade, they were able to produce a profit in excess of the previous years was mainly due to the fact that the value of the orders they had brought into 1921 was a high record, so that in the earlier months of the year those orders, together with the current orders coming in, kept them busy; but gradually, as the year advanced and those old orders were completed, their factories became less busy. With regard to the present position of trade, he could not see any immediate prospect of improvement in the foreign trade. There was a demand in foreign countries, but they were unable to meet the low prices due to low wages and depreciated exchanges. What foreign orders they obtained were taken at unremunerative prices to enable them to give as much employment as they possibly could. With regard to the home trade and trade with the British Overseas Dominions, there were decidedly signs of improvement. The demands for quotations had considerably increased in the past two months, and were many more than they were receiving in the latter months of last year. He did not think the home trade was going to boom yet, but it was satisfactory to be able to see signs of improvement.

Woking Electric Supply.

Mr. M. W. Ashby (chairman) presided at the annual meeting of the Woking Electric Supply Company last week. The total revenue for the year amounted to £44 219, less expenditure of £25 717, leaving a balance of £18 502, to which was added £1 201 brought in, making a total balance of £19 703. After deducting various charges, including over £4 000 for payment of dividends, there remained a balance of £12 014, out of which the directors propose to pay a dividend of 7 per cent. on the ordinary shares, to place £6 000 to depreciation, £2 000 to reserve, &c., and to carry forward £1 222. In the course of his remarks the chairman said there had been a saving on coal of £1 930, due very largely to the new plant and machinery. The turbo of the new boiler had been working very satisfactorily, and was undoubtedly a most useful addition to their equipment. During the year consumers had in-

creased by 127, and the number of lamps connected by 5 343. The number of units generated was 2 614 521, compared with 2 771 743 the previous year, a decrease of 157 222, due almost exclusively to the abnormally light and warm year, and also to the industrial depression which had prevailed. There had been an increase in the sale of both lighting and cooking units. As to the future, all the company asked was to be let alone. Given freedom from industrial unrest, restrictive legislation, excessive rates, and what had been described as "Poplar" finance, the outlook was bright, and they might look forward to a period of increased prosperity.

Metropolitan Electric Supply.

In the course of his remarks at the annual meeting of the Metropolitan Electric Supply Company on Tuesday, Mr. A. W. Tait (chairman of the company), who presided, said that the revenue from sales of current for the year was £520 802, as compared with £497 675 in 1920, being an increase of 4·6 per cent. In the number of units sold, 26 945 465, there was a decrease of 3·1 per cent., which was accounted for by the falling off in the demand of power consumers, due to trade depression. The units sold for lighting and heating showed an increase of 294 050. There was every reason to believe that the consumption for lighting and heating purposes would continue to show expansion, but he was doubtful whether the power load would increase to any extent in the current year. It was, however, satisfactory to be able to record that the development in the company's western area of supply continued, where fresh industries were being established. The costs of generation and distribution of electricity showed an increase of approximately £4 000 over the previous year. The company had already commenced to make certain reductions in their general power rates for small consumers, and he hoped that before long they would be able to give some concessions to their general consumers. The increase in charge so far as lighting consumers were concerned had not risen above 25 per cent. at any time since the commencement of the war. This was only rendered possible by the increase in efficiency of generation by the introduction of up-to-date plant. The directors recommended a final dividend at the rate of 10 per cent. per annum, making a total distribution for the year of 7 per cent., and leaving £3 609 to be carried forward. Apart from maintaining the dividend, they had applied an additional sum of approximately £5 000 out of revenue to the depreciation and reserve account.

Chelsea Electricity Supply.

The report for 1921 of the Chelsea Electricity Supply Company shows a profit for the year of £43 437, to which was added £2 249 10s. brought forward and £2 424 interest, making a total of £48 110 10s. After deducting interest on debenture stock (£4 260), interim dividend on the preference shares at the rate of 6 per cent. per annum (£900), and interim dividend on the ordinary shares at the rate of 5 per cent. per annum (£6 179 10s.), there remains a balance of £36 771, which the directors recommend shall be appropriated as follows:—To reserve, £17 000; to writing off the balance of the cost of extinction of founders' shares, £9 804; to final dividend on the preference shares at the rate of 6 per cent. per annum, making 6 per cent. for the year, £900; to final dividend on the ordinary shares at the rate of 7 per cent. per annum, making 6 per cent. for the year, £8 651; leaving a balance to be carried to the next account of £415. The number of 30-W lamp equivalents connected on Dec. 31 was 359 278, an addition of 5 763 during the year, and the total number of units sold was 4 828 604, being 87 524 less than that for the previous year.

Westminster Electric Supply.

Sir Edward Goulding (deputy chairman), presiding at the annual meeting of the Westminster Electric Supply Corporation last week, said that the erection of the new plant at the Central Company's station enabled them to shut down Davies-street station, and as this building (which was held on a lease) would no longer be required for the purposes of the company, it had been sold, together with the plant, at a satisfactory figure. The whole of the expenditure on this station had been written off, and the shutting down of the station would lead to greater economy in generation. It was not until the last quarter of the year that the new plant erected at Grove-road and Horseferry came into use. Since then the costs of generation had been substantially reduced. After prolonged negotiations they had been able to come to terms with the City of Westminster as to the replacement of the arc lighting with modern incandescent lamps. These lamps, without using any more current, had a greater illuminating power. The change over was completed early in February. An abstract of the accounts was given in our issue of Feb. 24.

City of London Electric Lighting.

The report of the City of London Electric Lighting Company shows a balance available for dividends on preference and ordinary shares, and for "carry forward" to 1922, of £132 243 10s. Dividends amounting to £97 044 were paid in September last, and the directors now recommend that balance dividends be paid, making a total distribution for the year on the first preference shares of 6 per cent. per annum, on the second preference shares of 8 per cent. per annum, and on the ordinary shares of 14 per cent. per annum. These dividends will absorb £67 200, leaving a balance to be carried forward to 1922 of £29 844. The company's service during the prolonged coal strike was maintained with great difficulty and expense, and, in May, recourse was had to oil fuel, the use of which the directors have determined to continue as an alternative source of fuel supply. The additional plant, referred to in the last report, has now been completed.

The Globe Telegraph & Trust Company have declared a quarterly dividend of 5s. (net) on the ordinary shares for the current year.

Stavely Coal and Iron Company announce a dividend of 5 per cent. per annum, tax free, for the half-year, payable March 31.

For the half-year to Jan. 31, 1922, Aberdeen Suburban Tramway Company made a profit of £1 050, making, with £2 293 brought in, £3 343.

The directors of O. C. Hawkes, Birmingham, recommend a final dividend on the ordinary shares at 10 per cent. per annum, less tax, making 8 per cent. for the year.

The Clyde Valley Electrical Power Company recommend a final dividend at the rate of 10 per cent. per annum, less tax, making 7½ per cent. for the year, the same as last year.

The net profits for 1921 of the Wemyss and District Tramways Company were £5 840, and £1 154 was brought forward. A dividend of 6 per cent., tax free, on the ordinary shares is recommended, leaving £401 to be carried forward.

The directors of Newcastle-on-Tyne Electric Supply Company recommend, subject to audit, that, in addition to the final dividend on the 7 per cent. cumulative preference shares, a dividend at the rate of 5 per cent. for the year be paid on the 5 per cent. preference shares.

Clarke, Chapman & Co. announce a dividend of 1s. 6d. per share, less tax, on the ordinary shares for the half-year, payable Mar. 15, making 2s. 6d. per share for the year. The sum of £20 000 is placed to reserve, £5 000 to reserve for workmen's compensation, £27 917 for depreciation, and £15 719 is carried forward.

The profit of Electro Bleach and By-Products for 1921, less repairs, standing charges, depreciation, and making reserve for income tax, excess profits duty and corporation tax, was £13 115, plus £5 921 brought in, making £19 036. The directors recommend a final dividend of 3½ per cent. on the preference shares, making 7 per cent., writing off patent account £4 957, and carrying forward £79.

The directors of the Western Telegraph Company have declared the second quarterly interim dividend of 5s. per share, free of income tax, for the year ending June 30, 1922, payable to shareholders registered on March 11, being at the rate of 10 per cent. per annum. The transfer books of the Company will be closed from the 11th to the 17th inst. inclusive.

The Report of Hastings and District Electric Tramways Company for 1921 shows a profit of £11 044, plus £1 000 brought in. The directors recommend the payment of 1½ per cent., being the balance of arrears of preference dividend for 1919, and a dividend of 6 per cent. on the preference shares for 1921. The sum of £5 000 has been placed to depreciation and £1 044 carried forward.

The Stock Exchange Committee have ordered $294 720 common stock of the Canadian General Electric Company and $1 750 000 first and second refunding mortgage 5 per cent. 30-year gold bonds of the Montreal Tramways Company to be quoted in the Official List, and have specially allowed dealings in 28 654 10s. fully paid ordinary shares of Fellows Magneto Company and £250 000 6 per cent. cumulative second preference stock of the North Metropolitan Electric Power Supply Company.

The revenue of the London & Suburban Traction Company for 1921 was £112 598, plus £2 100 brought in, making £114 697. Deducting administration and general expenses, interest on debenture stocks and deposits, 5 per cent "A" debenture stock service fund and corporation tax, the balance is £67 644. The directors propose a balance dividend of 2½ per cent. in respect of the year ended Dec. 31, 1917, on the cumulative preference shares, and 1 per cent. on account of the year ended Dec. 31, 1918, carrying forward £11 523.

In moving the adoption of the report and accounts of the Fife Tramway Light & Power Company at the annual meeting last week, Mr. W. Low, who presided, said that the gross receipts of all properties owned by the company amounted to £326 634 for the year ended Dec. 31, 1921 as compared with £303 904 for the previous year. The gross revenue from the company's properties amounted to £78 394, against £72 801 in 1920. The directors recommended payment of a dividend on the ordinary shares at the rate of 8 per cent. per annum, less tax.

For 1921 the gross revenue of the Underground Electric Railways Company of London was £770 000, an increase of £190 322. The balance available for interest on the 6 per cent. income bonds and for reserves was £387 958, an increase of £186 963. The interest on the income bonds is 4 per cent. for the year, and the balance of £26 241 is carried to the special reserve for equalisation of interest. For 1920 2 per cent. was paid on the income bonds. The loss in exchange owing to the encashment of coupons in New York and Amsterdam was £82 925, against £58 171 in 1920.

Presiding at the annual meeting of the Liverpool Overhead Railway last week, the chairman, Mr. H. C. Woodward, said that the decrease of 7 000 000 passengers during the past year was caused by the serious loss of trade and dock work of all kinds in the port, together with the departure of several big steamers from Southampton instead of Liverpool. The railway was entirely dependent upon the trade of the port for its prosperity, and for the past twelve months that trade had been almost in a state of paralysis. The ordinary weekday at the docks nowadays looked as Sunday once did. The general tone of commerce, however, led them to hope that things were on the turn, and he hoped that the tide of trade might take a rapid turn in the right direction. The accounts of the company were dealt with in our issue last week.

New Companies.

Cardiff Electrical Repairs, Ltd.

CARDIFF ELECTRICAL REPAIRS, LTD. (178 894). Private company. Registered Feb. 23. Capital, £1 000 in £1 shares. To take over the business of electrical and mechanical engineers carried on by E. A. Waugh and T. Richmond at Northcote-lane, Cardiff, as the Cardiff Electrical Repairs Company, and to carry on the business of electrical, mechanical, motor, and general engineers and contractors, &c. Permanent directors: A. E. Waugh and T. Richmond. Solicitor: T. J. Shackell, 2, Church-street, Cardiff.

Donaldson & Kelso, Ltd.

DONALDSON & KELSO, LTD. (12 067). Private company. Reg. in Edinburgh Feb. 23. Capital £1 500 in £1 shares. Electrical, mechanical, consulting and contracting engineers, &c. Subscribers: J. B. Muir, W. R. C. Murdoch, C. Murdoch. Secretary: W. R. C. Murdoch. Registered office: 98, West George-street, Glasgow.

Guaranteed, Ltd.

GUARANTEED, LTD. (179 993). Private company. Registered Feb. 28. Capital, £100 in £1 shares. Electrical manufacturers, supply agents and wholesale factors, electrical engineers and contractors, &c. Permanent directors: C. Seymour and H. Feneron. Qualification, £1. Registered office: 1 and 3, Sun-street, Finsbury-square, E.C. 2.

Henderson, Clifton & Co.

HENDERSON, CLIFTON & COMPANY, LTD. (179 995.) Private company. Registered Feb. 25. Capital, £1 500 in £1 shares. To take over the business carried on by A. J. Henderson at 35, Sackville-street, W. 1, as "Arthur Henderson & Company," and to carry on the business of consulting, mining, mechanical, electrical, petroleum, mining, and general engineers, &c. Permanent managing directors: A. J. Henderson and Major E. H. Clifton. Registered office: 35, Sackville-street, W. 1.

Matthew Wylie & Co., Ltd.

MATTHEW WYLIE & COMPANY, LTD. (12 065). Private company. Registered in Edinburgh Feb. 22. Capital, £50 000 in £1 shares. Engineers, machine makers, machinery importers, electricians, iron and brass founders, &c. Subscribers (each with one share): G. F. Todd and J. McKechnie. Registered office: 81, Portman-street, Kinning Park, Glasgow.

Selco, Ltd.

SELCO, LTD. (179 702). Private company. Registered Feb. 14. Capital, £100 in £1 shares. Consulting, mechanical and electrical engineers, &c. Subscribers (each with one share): Mackie Galstaun and Nellie Schofield. Solicitors: Gisborne, Woodhouse & Company, Temple Chambers, Temple-avenue, E.C. 4.

Southall Engineering Company.

SOUTHALL ENGINEERING CO., LTD. (180 058). Private company. Registered March 2. Capital, £3 000 in £1 shares. To adopt an agreement with A. Bailey, J. C. Weber and E. J. Selby, and to carry on the business of manufacturing mechanical and electrical engineers, &c. First directors: A. Bailey, J. C. Weber and R. Carter. Registered office: Pioneer Works, Hammond-road, Southall.

R. B. Wilson, Ltd.

R. B. WILSON, LTD. (N.I. 15). Private company. Reg. in Belfast Feb. 18. Capital £1 000 in £1 shares. Electrical and heating engineers, &c. First directors: D. Thompson and R. B. Wilson. Registered office: 103, Roden-street, Belfast.

COMPANIES INCORPORATED OUTSIDE THE U.K.

Bombay Electric Supply & Tramways Company, Ltd.

BOMBAY ELECTRIC SUPPLY & TRAMWAYS COMPANY, LTD. Incorporated in India on Oct, 1, 1920. Capital, Rs.3 90.00.000 in 600 000 ordinary and 180 000 preference shares of Rs.50 each. To acquire the undertaking and all or any of the assets and liabilities of the Bombay Electric Supply & Tramways Company, Ltd., incorporated in England in 1905, including the benefit of a deed of concession, dated Aug. 7, 1905, between the Municipal Corporation of the City of Bombay, W. D. Sheppard (Municipal Commissioner for City of Bombay), the Brush Electrical Engineering Company, and the Bombay Electric Supply and Tramways Company, to acquire certain licences granted to the Brush Electrical Engineering Company and the Bombay Electric Supply and Tramways Company, &c. British address is 3-4, Clement's Inn, Strand, W.C. 2, where F. C. Austen (London secretary) is authorised to accept service of process and notices on behalf of the company. Directors at date of incorporation: Sir Sassoon David, Bart., Sir Fazulbhoy Currimbhoy, F. E. Dinshaw, A. H. Froom, Chunilal V. Mehta, Sir Stanley Reed, F. C. Remington, and R. D. Tata. File number, 2 074F.

Clatworthy & Son, Ltd.

CLATWORTHY & SON, LTD. (2 083F.). Particulars filed Feb. 27. Capital 40 000 dollars in 100 dollars shares. Incorporated in Canada on Nov. 28, 1908, to manufacture, import and sell display fixtures, shop fittings, electric fixtures and appliances, &c. British address: Poland House, 167, Oxford-street, W. 1, where H. R. Hollinshead is authorised to accept service. Directors: G. Clatworthy, C. G. Clatworthy, W. F. Putt and Mrs. K. Clatworthy, all of Toronto.

An order was made on Feb. 9 RESTORING PATENT No. 19 851/1910 granted to Alphonse Constant Reyrolle and A. Reyrolle & Company, Ltd., for "Improvements relating to electrical cut-outs."

LAWRENCE, Mr. W., Rock-road, Torquay, electrical engineer. £11 4s. 9d. Nov. 29.

LIMBREY, F., & COMPANY, 38, Gondar-gardens, West Hampstead, electrical engineers. £13 13s. 5d. Nov. 14.

RIGBY, J. H., 22, Higher Hillgate, Stockport, electrical engineer. £16 10s. 8d. Dec. 22.

ROTHWELL, Peter (the elder), and ROTHWELL, Peter (the younger) (trading as PETER ROTHWELL & COMPANY), 64, Hr. Bridge-street, Bolton, electricians. £13 11s. 7d. Jan. 11.

THOMAS, Mr. J., 16A, Albion-street, Tunbridge Wells, electrical engineer. £36 10s. 1d. Dec. 23.

ULTRA MARINA TRUST, LTD., 8, Poland-street, W., magneto manufacturers. £78 9s. 7d. Nov. 11.

WESTON, Mr. G. A., 330, London-road, Westcliff-on-Sea, electrician. £14 19s. 4d. Jan. 3.

Bills of Sale.

[The undermentioned information is from the Official Registry. It includes Bills of Sale registered under the Act of 1822 and under the Act of 1878. Both kinds require registration every five years. Up to the date the information was obtained it was registered as given below; but payment may have been made in some of the cases, although no notice had been entered on the Register.]

GILL, Frederick John, Electric House, 26, Hardwick-street, Buxton, co. Derby, electrical engineer. Feb. 21. £150.

JOHNSON, Norman, 20, Stirling-road, Enfield, trading as NORMAN JOHNSON & COMPANY, at Hop Poles Engineering Works, Baker-street, Enfield, manufacturing mechanical and electrical engineers. March 4. £50.

KELLS, Joseph, 13, Abbey-road, Anfield, Liverpool, electrical engineer. Feb. 28. £100.

MATTHEWS, Henry Grindell, 2, Harewood-place, Oxford-street, W., electrical engineer. Feb. 28. £400.

Receivership.

BISHOPS CASTLE ELECTRIC LIGHT AND POWER CO., LTD.—W. H. Thomson, of 19a, Coleman Street, E.C., was appointed as receiver and manager on February 23, 1922, under powers contained in debentures dated February 8, 1915.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

BODMIN ELECTRIC LIGHT AND SUPPLY COMPANY, LTD. Registered Feb. 21, £2 000 debentures, present issue £1 900; general charge. *Nil. Dec. 31, 1920.

BOULTON MAGNETOS, LTD., Wolverhampton. Registered Feb. 17, £800 debentures: general charge. *——. Nov. 21, 1921

BRITISH MICA COMPANY, LTD., Bedford. Registered Feb. 16. £800 debentures, balance of £1 500: general charge. *£700. April 21, 1921.

ELECTRIC BRASS WARES, LTD., Liverpool. Registered Feb. 15, £500 debentures: general charge. *——. Sept. 19, 1921.

HARRISON BROTHERS (ELECTRICAL ENGINEERS) LTD., Middlesbrough. Registered Feb. 22, £2 000 debentures to Branch Nominees, Ltd., 15, Bishopsgate, E.C.; general charge. *Nil Aug 1, 1921.

McBEAN (J. H.), LTD., Batley, electrical engineers. Registered Feb. 18, £1 000 (not ex.) debentures, to National Provincial & Union Bank of England, Ltd.; general charge. *——. April 18, 1921.

MELBOURNE ELECTRIC SUPPLY COMPANY, LTD. (late ELECTRIC LIGHTING & TRACTION COMPANY OF AUSTRALIA, LTD.), London, E.C. Registered Feb. 7, trust deed dated Jan. 31, 1922, securing $2 500 000 in gold currency of the U.S.A.; charged on freehold properties of company in Australia, also general charge. *£702 178. Feb. 21, 1921.

PEWSEY ELECTRIC LIGHTING COMPANY, LTD. Registered Feb. 13, £2 000 debentures; general charge.

Private Meeting.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

GROVER, SMITH & WILLIS, electrical and mechanical engineers, Sarum Hill, Basingstoke. A circular has been issued in this matter stating that a conference of the larger trade creditors has been held, when it was stated that an offer might be forthcoming for the business at a figure sufficient to satisfy the claims of the creditors in full, the assets being £2 765, subject to realisation, and the liabilities £2 694. The circular further stated, "Unfortunately this offer has not been obtained, and at such conference it was resolved that in that event the debtors should execute a deed of assignment to Mr. E. H. Hawkins (Poppleton, Appleby & Hawkins) as trustee, together with a committee of inspection consisting of three of the principal creditors—Brown Brothers, Ltd., United States Rubber Company, and W. & A. Bates—and in accordance with such resolution the debtors have now assigned their estate to the trustee."

London Gazette.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

Companies Winding-up Voluntarily.

MIDLAND ELECTRIC ROTARY BLOWING COMPANY, LTD. J. W. Massey, of 46, Cherry-street, Birmingham, appointed liquidator. Meeting of creditors at 32, Curzon-street, Derby, on Thursday, March 9, at 12 noon.

READ, F. O., & COMPANY, LTD. C. H. N. Nathan, of Norfolk House, Norfolk-street, Westminster, appointed liquidator. Meeting of creditors at Donington House, Norfolk-street, London, W.C. 2, on March 14, at 12 noon. Particulars of claims by April 15 to the liquidator.

SEMCO, LTD. F. B. Darke, of Darke, Robson & Batty, 146, Bishopsgate, London, E.C. 2, appointed liquidator. Meeting of creditors at the Abercorn Rooms, Great Eastern Hotel, Bishopsgate, London, E.C. 2, on Thursday, March 16, at noon.

THANET ELECTRIC COMPANY, LTD. H. Kirby, of 840, Salisbury-house, London, E.C. 2, appointed liquidator. Meeting of creditors at the Institute of Chartered Secretaries, 59a, London-wall, E.C. 2, on Monday, March 20, at 11 a.m.

Bankruptcy Information.

GOSS, Frederick Charles, 32, Windsor-road, St. Andrew's Park, Bishopston, and at 71, North-road, Bristol, electrical engineer. Receiving order, Feb. 28. Debtor's petition. First meeting, March 10, 2.15 p.m., 26, Baldwin-street, Bristol. Public examination, April 21, 12 noon, Guildhall, Bristol.

HASLIN, John Joseph, 30, Nestfield-street, Darlington, Co. Durham, electric welder. Receiving order, March 1. Debtor's petition. First meeting, March 17, 2.15 p.m., 80, High-street, Stockton-on-Tees. Public examination, March 29, 11 a.m., Court House, Bridge-street, Stockton-on-Tees.

LIDDELL, Robert Henry, carrying on business under the name of LIDDELL & McINNES, at 4, The Crescent, Carlisle, electrical engineer. First meeting, March 15, 12 noon. 34, Fisher-street, Carlisle. Public examination, March 20, 11 a.m. Registrar's Chambers, 32, Lowther-street, Carlisle.

Notice of Dividend.

DRYSDALE, William, 24, Paxton-street, Barrow-in-Furness, electrician. Amount per £ 1d., final. Payable, March 11, 4, Ramsden-square, Barrow-in-Furness.

Partnerships Dissolved

CLARKE, Charles Henry, and DAVEY, William Charles, electrical and telephone engineers, under the style of W. E. WEEKES & COMPANY, by mutual consent as from Jan. 31, 1922. Debts received and paid by W. C. Davey, who will continue the business.

HERNE, Charles Thomas, and PITT, Frederick George, electricians, etc., 17, Motcomb-street, London, S.W., under the style of HERNE & COMPANY, by mutual consent as from Dec. 31, 1921. Debts received and paid by C. T. Herne, who will continue the business.

RUSSELL, Arthur Stanley, and MOORE, Harold Foster, electrical engineers, at Shafton-lane, Holbeck, Leeds, under the style of FIRTH & RUSSELL, by mutual consent as from Jan. 20, 1922. Debts received and paid by H. F. Moore, who will continue the business.

Edinburgh Gazette.

GRAFTON DYNAMOS, LTD. J. W. MacKinnon, Glasgow, appointed liquidator in voluntary winding-up of company.

Bankruptcy Proceedings.

INCE, Arthur Courtenay, trading as the NEWCASTLE ELECTRICAL ENGINEERING CO., late in partnership with another as the TYNE ELECTRICAL INDUSTRIES, 21, Fenkle Street, Newcastle-on-Tyne, electrical contractor. The first meeting of creditors was held last week. The statement of affairs showed liabilities of £413, against assets £170. The Official Receiver stated that there were several matters to be inquired into and he suggested that they should remain over until debtor's public examination on the following day. He proposed to ask for an adjournment of the examination. The creditors decided to adopt this course. The following are creditors: English Electric and Siemens Supplies Ltd., London, £40; General Electric Co., Newcastle-on-Tyne, £18; Lee, A. and Co., Ltd., Newcastle-on-Tyne, £36; Newcastle and District Electric Light Co., Ltd., Newcastle-on-Tyne, £10.

HOPKINS, J. Howard, formerly trading as the ELECTRICAL MAINTENANCE COMPANY, 140, Wardour Street, W. The above debtor, with total liablities £6 575 of which £956 is unsecured and no assets, attended at the London Bankruptcy Court, on the 3rd inst. for public examination. The Official Receiver elicited from the debtor that from 1906 to 1918 he was in employment latterly as managing director of a cinematograph company. In July of the latter year with a capital of £1 000 he commenced business as an electrical engineer at 87, Shaftesbury Avenue under the above style. The business was originally intended to maintain Cinema Electrical plants but developed into a Cinema Equipment Company. In or about March, 1919, he was joined in partnership by a Mr. C. A. Hale, who introduced £3 000 capital, of which witness received personally £1 200, and £1 800 went into the business, and in August, 1919, the business was transferred to the above address. Unfortunately he was unable to agree with his partner, and in September, 1920, the partnership was dissolved, witness purchasing his partner's interest for £5 000, payable £500 down and the balance by instalments of £40 a week. Unhappily he was not conversant with the equipment part of the business, and various mistakes which were made resulted in loss of orders and loss on contracts, and he admitted that the latter part of his trading was carried on at a loss. He consulted his solicitors, and on December 20, 1920, a meeting of his creditors was held, and as a result he executed a deed of assignment to Mr. O. Sunderland and Mr. A. F. Stoy as trustees for the benefit of creditors. The claims of the creditors who assented to the deed were £20 000, and they comprised the whole of his creditors with the exception of the petitioning creditor, Mr. Rayman, who did not join in the deed. Under the deed up to the present dividends aggregating 2s. in the £ had been paid, and he believed a further 2s. or 3s. would be paid. He attributed his failure to his liability under a judgment obtained against him by the petitioning credtor for cash advanced. The examination was ordered to be concluded.

Prices of Metals, Chemicals, &c.

TUESDAY, MARCH 7.

		Price.	Inc.	Dec.

Arrangements for the Week.

FRIDAY, March 10th (to-day).

PHYSICAL SOCIETY.

5 p.m. At the Imperial College of Science, South Kensington, London, S.W. Papers on "The Electromagnetic Screening of a Triode Oscillator," by Mr. R. L. Smith-Rose; "A New Form of High Vacuum Automatic Mercury Pump," by Dr. H. P. Waran; and "Viscosity Determination by Means of Orifices and Short Tubes," by Mr. W. N. Bond.

INSTITUTION OF ELECTRICAL ENGINEERS.

NORTH-WESTERN CENTRE.

7.30 p.m. At the College of Technology, Manchester. Exhibition of Cinematograph Films, by Dr. C. C. Garrard and Mr. F. Gill, O.B.E.

SCOTTISH CENTRE. STUDENTS' SECTION.

7.30 p.m. At the Royal Technical College, Glasgow. Annual General Meeting and Paper on "Electricity in Mines," by Mr. J. C. Stewart.

IRISH CENTRE.

8 p.m. At the Royal College of Science, Upper Merrion-street, Dublin. Paper on "Wireless Communications in the Campaign in France," by Prof. R. Stanley.

JUNIOR INSTITUTION OF ENGINEERS.

8 p.m. At Caxton Hall, London, S.W. Paper on "Friction," by Mr. C. H. Plant.

ELECTRO-HARMONIC SOCIETY.

8 p.m. At Cannon-street Hotel, London, E.C. Smoking Concert.

ROYAL INSTITUTION.

9 p.m. At Albemarle-street, London, W. Discourse on "Problems in the Variability of Spectra," by Prof. T. R. Merton, F.R.S.

SATURDAY, March 11th.

ROYAL INSTITUTION.

3 p.m. At Albemarle-street, London, W. Lecture on "Radio-Activity," by Sir Ernest Rutherford, F.R.S. (Lecture II.)

BIRMINGHAM AND DISTRICT ELECTRIC CLUB.

7 p.m. At the Grand Hotel, Colmore-row, Birmingham. Paper on "Ball Bearings," by Mr. A. Macaulay.

MONDAY, March 13th.

INSTITUTION OF ELECTRICAL ENGINEERS.

DUNDEE SUB-CENTRE.

7.30 p.m. At University College, Dundee. Papers on "Electric Motor Starters," by Mr. J. Anderson, and "Induction-Type Synchronous Motors," by Mr. L. H. A. Carr.

NORTH-EASTERN CENTRE.

7.30 p.m. At Armstrong College, Newcastle. Address on "Primary and Secondary Education of Engineers," by Mr. J. S. Highfield.

TUESDAY, March 14th.

WOMEN'S ENGINEERING SOCIETY.

6.15 p.m. At 26, George-street, Hanover-square, London, W. Lecture on "Women's Place in Industry," by Mr. F. S. Button.

NATIONAL ASSOCIATION OF SUPERVISING ELECTRICIANS.

6.45 p.m. At St. Bride's Institute, Bride-lane, London, E.C. Paper on "The Determination of Heat Loss from Buildings, with Special Reference to Electrical Heating," by Mr. W. W. Nobbs.

INSTITUTION OF ELECTRICAL ENGINEERS.

SCOTTISH CENTRE.

7 p.m. At the North British Station Hotel, Edinburgh. Paper on "Telephone Line Work in the United States," by Mr. E. S. Byng.

NORTH-WESTERN STUDENTS' CENTRE.

7.30 p.m. At Houldsworth Hall, Deansgate, Manchester. Paper on "Commutation, Armature Reaction, and the Selection of Carbon Brushes for Dynamo Electric Machinery," by Mr. J. W. A. Abernethy.

WEDNESDAY, March 15th.

SOUTH MIDLAND CENTRE.

7 p.m. At the University, Birmingham. Paper on "Electric Motor Starters," by Mr. J. Anderson.

SHEFFIELD SUB-CENTRE.

7.30 p.m. At the Royal Victoria Hotel, Sheffield. Paper on "Notes on the Practical Operation of E.H.T. Protective Gear," by Mr. F. Langley.

INDUSTRIAL LEAGUE COUNCIL.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "Psychology in Industry," by Mr. W. Piercey, C.B.E.

THURSDAY, March 16th.

INSTITUTION OF ELECTRICAL ENGINEERS.

6 p.m. At Savoy-place, London, W.C. Paper on "Phantom Telephone Circuits and Combined Telegraph and Telephone Circuits Worked at Audio Frequencies," by Mr. J. G. Hill.

FRIDAY, March 17th.

LONDON STUDENTS' SECTION.

7 p.m. At Savoy-place, London, W.C. Paper on "The Electron Theory," by Mr. C. C. H. Wade.

BRITISH ELECTRICAL DEVELOPMENT ASSOCIATION.

7.30 p.m. At the Chartered Institute of Patent Agents, Staple Inn-buildings, London, W.C. Salesmanship Conference. No. 5, "Salesmanship in Relation to Showroom Displays and Demonstrations." Speaker: Mr. A. C. Bostel.

Patent Record.

APPLICATIONS FOR PATENTS

December 2, 1921.

32 321 AMBERTON. Electric control systems.
32 342 TAYLER. System of electric lighting in combination with piano, &c
32 352 METROPOLITAN-VICKERS ELECTRICAL CO. Switches. (2/12/20, U.S.)
32 363 GES FÜR DRAHTLOSE TELEGRAPHIE. Thermionic generators. (3/12/20, Germany.)
32 364 GES FÜR DRAHTLOSE TELEGRAPHIE. Generation of electrical oscillations by thermionic valves. (4/12/20, Germany.)
32 365 GES FÜR DRAHTLOSE TELEGRAPHIE. Calling apparatus for high-frequency telegraphy. (4/12/20, Germany.)
32 377 AKT. GES. BROWN, BOVERIE ET CIE. Apparatus for preventing occurrence of higher harmonic currents in working of metal vapour rectifiers. (6/12/20, Switzerland.)
32 380 B. T.-H. CO. & FARMER (G. E. Co.). Electric motor control.
32 381 B. T.-H. CO. (G. E. Co.). Switches.
32 385 DETMOLD. Coupling electric leads to terminals.
32 386 DETMOLD. Electric terminals, adaptors, &c.

December 3, 1921.

32 421 COLEBROOKE & WILLIAMS. Vacuum, &c., tubes for electrical discharges.
32 422 JACKSON. Motor control systems.
32 447 BUDD MFG. CO. Automatic electric welding machines. (13/12/20, U.S.)
32 493 VAUDERVELL. Electric machines.
32 499 RUNBAKEN & TORRANCE. Means for varying intensity of illumination of road vehicle electric lamps.
32 501 STERLING TELEPHONE & ELECTRIC CO. Indicator systems for lifts, &c.
32 502 SEFTON-JONES (Lorenz Akt. Ges.). High-frequency telephony.

December 5, 1921.

32 523 ROLLER. Electric generator. (4/12/20, Germany.)
32 527 COLLINGHAM & OWEN. Driving mechanism of electric generators.
32 530 DEPREE & HOKER. Electric heaters for internal combustion engines.
32 549 BERESFORD. Combined electric heating and lighting apparatus.
32 580 DORNIG. Wireless telegraph antennæ.
32 583 POLLAK, SIEMENS & HALSKE A. G. Telephone systems.
32 595 MASCHINENFABRIK SCHIESS, A. G. & BECKER. Driving machine tools with independent electrical drives. (6/12/20, Germany.)
32 596 MITCHELL. Anti-climbing devices for posts carrying electric wires, &c.
32 597 REGAN. Electric train control systems.
32 621 SHAWMUT MACHINE WORKS, INC. Thermostatically-controlled socket switches. (3/12/20, U.S.)

December 6, 1921.

32 628 WATSON. Electric pianoforte-driers.
32 693 CHARLIER. Heating devices and electric furnaces.
32 715 B. T.-H. CO. & WHITAKER. Electric machines.
32 716 B. T.-H. CO. (G. E. Co.). Electric lamp fittings.
32 725 FERRANTI. Fastening transformers in their oil tanks.
32 726 FERRANTI. Supporting devices for transformers, &c.
32 732 AKT. GES. BROWN, BOVERI ET CIE. Method of installing turbines for driving dynamos. (7/6/21, Switzerland.)

December 7, 1921.

32 780 SUTHERLAND, LTD. & COOKE. Switches and contacts.
32 805 BECKER & DEGGE. Dimming switch for lighting system of automobiles.
32 808 ARTHUR, SPROSEN & HARDY. Dimmer switches for headlights of motor-cycles, &c.
32 872 MCLACHLAN & LANGRIDGE. Wireless telegraph receiving apparatus.
32 874 BRYAN. Electric radiators.
32 875 BUCKLEY. Multi-pole switch.
32 876 BUCKLEY. Electric starting motor for engines.
32 892 MOULLIN. Measurement of alternating voltages.

December 8, 1921.

32 872 LANGRIDGE. Wireless telegraph receiving apparatus.
32 893 LYMBURN. Electric lamp bulbs.
32 904 LEWIS. Magnetos.
32 917 FOX. Electric torches.
32 930 ROHNER & SIMIC. Incandescent lamps.
32 963 OPTISCHE ANSTALT C. P. GOERZ A. G. Electromotive devices for calculating machines. (11/12/20, Germany.)
32 971 MOODY. Variable inductance and transformer coils for wireless circuits.
32 976 WESTERN ELECTRIC CO. Oscillation generators. (22/12/20, U.S.)
32 977 WESTERN ELECTRIC CO. Telephone systems.
32 981 INGGS & LUCAS. Electric horns for motor vehicles.
32 982 SIBILS. Incandescent lamp holders.
32 987 SAYERS. Connection of windings to commutators in electric machines.
32 997 HUTCHESON. Devices for registering telephone calls.
32 999 GES. FÜR DRAHTLOSE TELEGRAPHIE & GEWESKE. High-frequency telephony. (26/1/21, Germany.)

December 9, 1921.

33 047 STRONG. Railway or tramway rail joints.
33 051 VERITY'S, LTD., & PIPKIN. Switches, and operating gear therefor.
33 060 CABLE ACCESSORIES CO., REEVES & CRAWFORD. Fuse boards.
33 098 CALLENDER'S CABLE & CONSTRUCTION CO., MATHER & HUNTER. Feeder connectors for contact rails on electric railways.
33 099 CALLENDER'S CABLE & CONSTRUCTION CO., MCCALLUM & MACALISTER. Supports for cables, pipes, &c.
33 116 WESTERN ELECTRIC CO. Microphones. (24/12/20, U.S.)
33 119 WHITE. Mounting and driving magnetos.
33 129 COVENTRY AUTOMATIC TELEPHONES, LTD., PEEL-CONNER TELEPHONE WORKS & MCBERTY. Machine-switching telephone exchange systems.
33 132 SEFTON-JONES (Lorenz Akt. Ges.). Process for increasing frequency.
33 135 DONNISTHORNE. Production of h.t. unidirectional currents.
33 137 FOX & HAYES. Electric heating systems.
33 151 SIEMENS-SCHUCKERTWERKE. Electrical precipitation of suspended particles from fluids. (28/6/21, Germany.)
33 153 CROSS (Mordey). Electricity meters.
33 154 STROHMENGER. Arc welding appliances.
33 160 VEDOVELLI. Transformers.

CONTENTS.

Notes of the Week.

Electricity Bill Propaganda.

Now that the Electricity Bill has passed the second reading in the House of Lords the virulent propaganda to which we drew attention last week has publicly died down, though we have no doubt it is still being conducted under the surface. We suspect that this opposition emanates from certain private interests. It is therefore local rather than national and of a stertorousness out of all proportion to its size. If it wins the day it may improve its own position, though that is by no means certain, but it will inevitably retard the progress of the electricity supply, and therefore malevolently affect the electrical industry. We are not surprised to learn that its course is being watched with anxiety in official circles and by those who recognise that the passing of such a measure is vital to electricity well-being. We are pleased, however, to notice that Sir Harry Renwick, chairman of the County of London Company, and one of the soundest authorities on electrical legislation and finance, recognises that the Bill contains many useful provisions, though he hints at certain amendments being necessary. These are surely a matter for arrangement, not propaganda.

The Financial Bogey.

Watching is not enough, however. And it is high time the supporters of the Bill were up and doing. Articles and speeches such as those to which we called attention last week, ill informed though they be, will inevitably do a great deal of harm unless the fallacies they contain are promptly exposed. Especially is it necessary that municipal authorities should take action, as they stand to lose most if the Bill fails to pass. This is the more essential, as the principal and most subtle argument against the Bill is that voiced by Lord Buckmaster, who complained that granting a local authority free powers to finance a Joint Electricity Authority would tend to the multiplication of local burdens, a thing, of course, which we all wish to avoid. But the frenzied finance which Lord Buckmaster fears can be adequately prevented not only by the ratepayers themselves but by the policy of the Commissioners. Incidentally, the grouping of stations and the extended control over the electricity supply in a large area, which the establishment of Joint Electricity Authorities will make possible, is likely to be cheaper for the ratepayers than continuing on present lines, interested arguments to the contrary notwithstanding. If, however, these safeguards are considered to be insufficient, a provision might be inserted whereby the contribution of each municipality is based on the proportion that its own assessable value bears to the assessable value of the district of which it forms a part.

The Real Danger.

These, however, are details, and we would ask the opponents of the Bill to pause and consider what will happen if the present measure is dropped. It is certain that development will be at once stunted, and uncertainty will continue to reign, with all its disadvantages, while in the not unlikely event of a Labour Government coming into being private enterprise will be replaced by bureaucratic control. Even from the most selfish point of view, therefore, it would be as well for the opposition to take what is now given than to wait longer and then to receive nothing. We therefore hope that those who are responsible for this propaganda will see the error of their ways and realise that not only the development of the whole industry but their own well-being depends on the passing of this measure. If with that measure could be combined a modification of the purchase clause, great good would be done, and we suspect that much of the present opposition would be neutralised. But while objection may be rightly used as a means of gaining concessions, care must be taken that it is not pushed too far. In this case that is a real danger.

Unfair Criticism.

Most unfair in this connection is Lord Bessborough's complaint that the Commissioners have done nothing. In truth they have done a great deal. That they have not done more is solely because their powers have been limited, a limitation which is one of the things that the Bill designs to remove. In addition, their task is a gigantic one, beset with difficulties and complications. The view may be taken that the official conception of electricity supply reorganisation is wrong, in which case both the present Bill and the Electricity Supply Act are unnecessary, but it is hardly fair to give the Commissioners a blunt chisel and then complain that they have not turned out a finished sculpture.

London "Underground" Extensions.

The announcement made by Lord Ashfield at the meeting of the Underground Electric Railways Company last week, that the Government had now agreed to guarantee the principal and interest upon a capital sum not exceeding £5 000 000 means that the amended scheme of tube railway extension and improvement has been accepted in principle. This is a very welcome decision, as it will mean a considerable addition to the transport facilities of the metropolis in the immediate future. Some of the projected improvements, such as the enlargement of the tunnels of the City and South London Railway and the provision of a connecting link between it and the Charing Cross Railway at Euston, are long overdue, but financial and other difficulties have hitherto prevented progress being made with them. Others include the extension of the electric railway from Golders Green to Edgware and the linking up of the Central London Railway with Richmond. The latter will afford an alternative route between the City, Kew and Richmond and relieve the congestion on the District Railway. In addition to providing increased transport facilities the scheme will give a good deal of employment at a time when it is badly needed.

Early Railway History.

The history of the pioneer electric railway is a striking illustration of the slow, though certain, development of British schemes. Originally incorporated in 1884 as the City and Southwark Subway Company, the title was altered in 1890. The first section of the line was opened for traffic in December of the latter year, and was at once a pronounced success. The consulting electrical engineer was the late Dr. E. Hopkinson, and Mather and Platt supplied the locomotives and rolling stock. Extensions have since been made at both ends of the line, but, like all pioneer undertakings, it has been affected by the march of progress. Other tube railways, with larger tunnels and better rolling stock, followed in due course, and for a long time it has been evident that improvements were essential in order to enable it to cope with modern conditions.

Regenerative Braking and Single Phase Traction.

A short time ago we drew attention to the economic and operating advantages which might be obtained by the introduction of some system of regenerative braking on the London Underground Railways. These advantages would, however, be accompanied by the disadvantages that extra equipment would be required and that the average speed would be reduced. On the other hand, where long down grades have to be negotiated energy can be returned to the line in sufficient quantities, if some system of regenerative braking is employed, to make the use of one of the systems available worth consideration on at least some of the sections of railway in this country. The possibilities of regenerative braking depend to some extent on the system of traction employed, and at a time when opinion in this country is beginning to favour single-phase working the article by Mr. E. Nordefeldt on "Regenerative Braking and Single-Phase Commutator Motors," which appears on another page of this issue, will be of interest.

Disadvantages of the Series Motor.

Mr. Nordefeldt, who discusses the question exhaustively, begins by pointing out that for regenerative braking on the single-phase system the use of series motors has been found impracticable. This may be a grave disadvantage in the light of past experience with this type of motor in traction work, and, if Mr. Nordefeldt is to be believed, would necessitate the employment of a shunt motor in which the phase angle of the field is rotated. A better arrangement, however, seems to be to employ a separately excited motor, but Mr. Nordefeldt holds the balance very equally between these varieties, and by means of diagrams compares their properties, especially with regard to braking at variable speeds. On the score of utilisation of the regenerated power and ease of control the most suitable type of machine is one whose excitation is independent of the speed and whose phase angle varies by 60 degrees from that of the transformer. To provide such conditions means the use of a special converter, and therefore a certain addition to the weight and cost of the locomotive. It may, however, be that these disadvantages are more than set off by the advantages gained.

Commutation Difficulties.

Commutation is always a bogey in such cases. But Mr. Nordefeldt's analysis of the problem shows that devices for obtaining the proper phase on the commutating field at all speeds can be provided without any great difficulty. Obviously this is a problem which cannot be decided without excursions into more practical fields than those explored by Mr. Nordefeldt. For local conditions will play a great part, as will the cost of energy and the density of the traffic. But regenerative braking is a device for which a good deal can be said, and we hope that traction companies will not neglect its possibilities in working out the schemes which we hope are to come into being in the near future.

Industrial Electrical Heating.

The strenuous and organised efforts made by advocates of gas to obtain a heating load have not yet been paralleled in the electrical industry, but with the continued growth of E.D.A. we may look forward to an equally earnest presentation of the electrical case. In the meantime the lecture given by Mr. J. G. Pearce to the Sheffield Gas Consumers' Association is an admirable example of the service which can be rendered to the industry by its members. Sheffield is an enormous consumer of industrial gas and a great stronghold of gas users. It is significant that they should seek light on electrical heating, and we urge Mr. Fedden and the salesmen of the Electricity Supply Department to lose no time in following up the matter. We are so preoccupied with questions of lighting and power that we may well question whether engineers as a body realise the full advantages of electrical heating. But when every electrical engineer's house is an all-electric house, when every electrical factory is a standard example of the advantages of electrical industrial heating, we may expect more progress in other industries.

Heating an Ideal Load.

Mr. Pearce's restraint in dealing with gas is specially commendable, for a statement which bears all traces of fair and impartial treatment is worth more than an unlimited amount of partisan propaganda, but the influence of electrical developments on the future price of power, the efficiency and convenience of electrical transmission, and the efficiency of the application of electrical heating cannot be ignored. When these advantages are combined with freedom from products of combustion, ease of temperature control, and absence of spoiled work the case for electricity for precision heating is unanswerable. Furthermore, the resistance furnace offers an ideal load both from the point of view of power factor and load factor, and station engineers might with advantage give preferential rates to consumers installing such furnaces for large outputs even where the ordinary power rate is already low. American experience suggests that such a load will become an appreciable fraction of the total output.

The Use of Light as an Aid to Aerial Navigation.

The use of light as an aid to traffic, particularly on motor vehicles, has been much in the public mind of late. At a recent meeting of the Illuminating Engineering Society a more novel and highly intricate problem—the use of light in aerial navigation—was discussed. Lieut.-Colonel L. F. Blandy, who read the introductory Paper, first described the lighting arrangements on the aircraft itself and afterwards passed on to the illumination of aerodromes. Light for the use of the crew and passengers is derived from a generator driven by the engine and is thus necessarily limited. We observe that in the passenger accommodation 48 lamps of 8 c.p. are contemplated, while in the body of the airship devoted to the crew's quarters, etc., there are ten lights of 3 c.p. An interesting development is the attempt to follow the usual procedure in the case of ships at sea by providing a white light forward, a green light on the right side, and a red light on the left side. In view of the high speeds attained by aircraft (approaching 200 miles per hour, or 3·3 miles per minute), the design of such lights is obviously important, for from the time of sighting the head lights to the moment of collision would be only 90 seconds!

Landing Lights.

As regards lights to facilitate landing, we observe that both chemical flares and electric lamps have been developed, the concensus of opinion being that the electric lamp is as serviceable as the chemical one. Aerodrome lighting involves three distinct problems—(1) obstruction lights, *i.e.*, lights used to indicate buildings or other obstructions; (2) illumination of the actual landing ground; and (3) fixed illuminated signs to show direction of wind, etc. Groups of coloured lights may also be used to identify particular aerodromes. The International Aircraft Convention has occupied itself with these problems, one recommendation being the arrangement of lights in the form of " L's " to facilitate landing; such lights have been installed at the Croydon aerodrome with fair success. It would appear that the aerial lighthouses have now reached a fair stage of development; apparently these are commonly supplied by dissolved acetylene, but doubtless electric light may be used in localities where electricity is readily available. It is evident that finality in such methods has not yet been reached, but the Paper furnishes a useful review of existing methods and future possibilities.

The Lock-Out.

In spite of eleventh-hour efforts of the kind to which we have become accustomed, the lock-out of members of the Amalgamated Engineering Union by federated firms came into operation at midnight on Sunday. At the time of going to press little has been done to overcome the deadlock, and the activities of both sides have been mainly engaged in re-stating their case and refuting each other's arguments. This is not likely to lead to peace, and is the more deplorable since the men's leaders have adopted a conciliatory attitude throughout, and their present position is the combined result of the strategy of the employers and the hot-headedness of certain of their followers. As we have already argued, the contention that managerial functions can be exercised by a trades union must fail, but with its failure may go the fall of the present moderate leaders and the appearance of a condition of things which will only be welcomed by the extremists of both parties. At a time when increased trade is essential to the well-being of the country the dispute should never have been allowed to reach this acute stage, and we hope that the moderates on both sides will see that it is composed without delay, and that, at any rate, it is not allowed to spread to other unions. Unfortunately, the extremists are active, and the E.T.U. especially seem anxious to join in the fray.

Supply Companies in 1921.

If dividend-earning capacity be treated as the criterion of success of public companies, then those engaged in the business of electricity supply must be looked upon as among the most successful of undertakings. For in the great majority of cases the results for 1921 show a marked improvement over those of the previous year. With a few exceptions, the ordinary dividend has been maintained at the same level as in 1920, and in some instances there has even been an increased distribution. At the present time the stock and shares of electricity supply companies are readily taken up by investors, and the developments likely to ensue upon the reorganisation of the industry are sure to enhance this attractiveness. For nowhere is there any indication that the demand for electricity has yet reached the saturation point, and the next few years should witness considerable expansion, more particularly of the power and domestic loads.

London Companies.

Among the companies serving the London area five have declared a higher rate of dividend on their ordinary shares than in 1920. These are the Charing Cross, the Kensington and Knightsbridge, the London Electric, the North Metropolitan Electric Power, and the South Metropolitan Electric Light and Power Companies. The remaining London companies, while maintaining the same rates of distribution as in the previous year, show improved results as indicated by the larger sums placed to reserve and depreciation and the increase in the amounts carried forward. Generally speaking, the gross receipts, the net profit, the units sold, and the connections all showed appreciable advances, but in four cases—the Westminster, St. James's, Kensington, and Metropolitan companies—there was a slight drop in the number of units sold. It will be noticed that all these companies are supplying in high-class residential areas, and the restrictions imposed during the coal strike, coupled with the fine summer, would be more than sufficient to account for this slight falling off in the consumption, which was mainly in the lighting and heating units.

Reductions in Charges.

It is, however, satisfactory to notice that these companies, as well as the other undertakings, report that the demand for new services and connections is as great as ever it has been, and that the prospect is exceptionally bright. Some of them have wisely decided to make a reduction in the price of electricity, and this should still further increase the consumption and also the receipts. With the fall in the cost of fuel and with the reductions in the price of materials and other expenditure the question of a substantial drop in electricity charges should now be seriously considered by all supply undertakings. It would have a most beneficial effect upon demand and it would greatly assist industrial development by reducing the cost of manufacture.

The Year's Anxieties and Troubles.

Though the year's results have been so satisfactory, success was only achieved after a good deal of anxiety and by the exercise of constant vigilance. The long and disastrous coal strike seriously affected all undertakings by increasing the price of fuel and by limiting the consumption. Many of the undertakings were fortunate in having reserves of coal, and a few were able to use oil fuel as a temporary expedient, and thus the storm, which had such disastrous effects on industry as a whole, was successfully weathered. As might be anticipated, the tendency to employ larger, more efficient, and more economical turbo-generating sets continues, but we notice that complaints of delay in the delivery of plant are still being made. Whatever justification there may have been for belated deliveries in the past, there should be none now, and it is to be hoped that manufacturers for their own sakes will make every effort to work off outstanding orders.

Rising Rates and Heavy Taxes.

Many of the chairmen, naturally, made reference in the course of their speeches to the increasing and almost unbearable burden of rates and taxes. Mr. R. H. Benson, chairman of the London Electric Supply Corporation, made use of a diagram to show graphically the increase in the rates since 1914. In the latter year rates, etc., accounted for 1s. 9d. out of every pound of the company's gross revenue, but in 1921 they represented 3s. 5¾d. This is a very good way of bringing home to the man in the street the incidence of these public burdens, and other companies might follow his example. The Corporation Profits Tax, another heavy and unfair burden, came in for general condemnation. In effect this will mean an addition to the cost of electricity, and is a clog upon progress. Therefore we wish the companies success in their endeavours to get it abolished.

Future Prospects.

Notwithstanding these difficulties and troubles, general optimism was the prevailing note at the meetings. Provided the companies obtain, as the result of the scheme of reorganisation at present under consideration, an extended tenure of their distribution business, we feel sure that the receipts will continue to expand in a satisfactory manner, and that the shareholders can look forward with confidence to increased prosperity and higher dividends in future. We are pleased to notice that the companies fully realise the necessity for the reorganisation of supply, and though there are two main problems—management and engineering—to be solved, the engineering question is by far the more important. As Mr. Fladgate, of the Charing Cross Company, rightly points out, unless the engineering details are worked out on sound and economic principles the success of any scheme is impossible. Having regard to the knowledge and experience of their joint advisers, he was not willing to advise any serious departure from the engineering scheme they had prepared. No doubt there are exceptional difficulties to be solved before the London supply problem can be settled, but with patience and skill we believe that the Commissioners will overcome all obstacles, though it may eventually be necessary to pass special legislation to deal with the case properly.

Provincial Companies.

In the main the results obtained by the provincial companies are quite as good as could be expected under the circumstances. A few of them, such as the group controlled by the Midland Counties Electric Supply Company, which operates in industrial areas, were badly affected by the restrictions imposed by the coal strike, and do not show up as well as in the previous year. The majority, however, including the Yorkshire and Clyde Valley Electric Power, the Fife Tramway Light and Power, the Oxford, Bournemouth, Northampton, Rushden, and Woking companies, record an increase in both gross and net revenue, and the previous year's dividends have also either been maintained or increased. The new consumers and connections to the mains have been up to the average. It is also gratifying to learn that there is now a decided downward tendency in generating costs, and, provided there are no industrial troubles, the current year's records should show a marked improvement in sales, revenue, and connections.

Developments.

Though the Northampton and Rushden Companies serve highly industrialised areas, they have been able to increase the ordinary dividend by one per cent., mainly through the good demand for power. Both companies have in operation a useful scheme for the hiring out of motors, and so successful has this been and so extensively is it taken advantage of by small manufacturers that nearly half the motors in use are on hire. This is an example which might be followed by other companies with advantage. We also notice that the power companies controlled by the Midland Counties Company are gradually transforming themselves into retail distribution authorities, for four special orders for the supply of electricity have been secured by them. This is also a development that might be expected, though it will eventually lead to a transformation in the character and duties of power companies. Hitherto these have been too restricted by their statutory authority, and greater flexibility and freedom of action would be an advantage to all concerned. It should certainly lead to an expansion of electricity supply in small urban and rural districts.

Institution Affairs.

The special general meetings of the Institution of Electrical Engineers which are to be held on Thursday next to transact certain business necessitated by the granting of the Royal Charter, may or may not be seized as an opportunity by persistent critics of the Council's policy to come into the limelight and air their views on things in general and themselves in particular. There will, however, be little excuse for the exercise of oratory at the first meeting, where the business is innocent enough both in intention and in fact. It should therefore be easily transacted in the fifteen minutes allotted.

At it the Council will ask permission to transfer to the Chartered Institution the remainder of the liabilities of the

old Institution, such as the mortgages on the building in Savoy Place and the property in Tothill Street, Westminster. It may be thought that in these days of high land values there is an excellent chance of getting rid of the Tothill Street site at a good price, but no doubt the advantages and disadvantages of this course have been duly weighed. There is this to be said for it that the site is a valuable one, and, with the demand for increased office accommodation in the Victoria-street area, may even improve in this respect as time goes on.

The New Bye-Laws.

Proceedings at the second meeting, which is confined to Corporate members, may, however, be a little more interesting. The granting of a Royal Charter has necessitated the conversion of the Articles of Association into Bye-Laws, with consequent more or less formal changes in wording involving no questions of principle. But the Council have not resisted the temptation to make other changes, and criticism may therefore have a slight chance in dealing with these alterations where they affect the supposed interests of members.

Critics may, for instance, object to the deletion from Bye-Law 12 of " prominent association with the objects of the Institution " as a qualification for full membership, if in the opinion of the Council such membership would conduce to the interests of the Institution. But they should have short shrift. For we agree with the Council that this alteration is essential to preserve the strictly technical character of the qualifications for membership, and that those whose connection with the Institution can only be evaluated on such a profit and loss basis must be dealt with by other methods than by election to full membership. As it stood the Article provided a temptation to which it was sometimes only too easy to give way to, as anyone who glances through the membership lists of twenty years ago can discover for himself.

Isolation of Associates.

Again, transfers to the class of Associates from other classes of membership is not in future to be permitted, and Associates who wish to transfer to other classes will have to go through the usual procedure of election. The modified procedure of transfer from Associateship to the other classes which is now to be dropped was a relic of the time when the former class contained members with technical qualifications, whose progress into fields where they more properly belonged it was desired to facilitate. But now it consists almost entirely of those who are " interested " in the work of the Institution, but are without the necessary technical qualifications for the other classes, and no difference in procedure is necessary. This class should, in fact, more and more become a haven for the non-professional members of the electrical industry whence they can mutually assist and be assisted.

Life Membership Payments and Expulsion.

The subject of life membership and the payment therefor have always been irritating to some people, and there may therefore, be a storm over the suggestion to calculate the sum to be paid for a life composition on the candidate's expectation of life. But the idea is theoretically sound, though it will not encourage younger men to provide the Institution with capital. Democrats will doubtless, also, object to the Bye-Law which places the authority for expulsion in the hands of the Council instead of depending on the vote of a General Meeting. We hope, however, there will be few cases where this will be necessary, and even for those it is kindest and best for the proceedings to be conducted *in camera*.

The office of honorary solicitor is to be abolished. This may upset the economists, but it is considered that the time has come when the Institution should pay the customary remuneration for any legal work. We agree. At the same time we view with regret the passing of an office that, whatever its disadvantages, did at least provide an answer to the slur that a solicitor's first consideration is his own pocket and that his clients' interests are only secondary.

Council Elections.

But the main storm will, we feel sure, rage round Bye-Laws Nos. 44 to 51, which deal with the election of the Council and alter present procedure not a little. In future only British subjects will be eligible for election, while vice-presidents and members of the Council will be elected for a definite term of three years. This fixed term is considered preferable to the former system, under which a certain number of vacancies were created each year, with the result that members sometimes had to retire before they had served their full term.

The Honorary Treasurer will, as now, be re-elected every year, but he can only hold office for a total of three years. We are not certain whether this is altogether progressive. The finances of a body such as the Institution are a complicated matter, and it is not true economy which permits the honorary treasurer to retire just when he is really becoming familiar with their working. An Associate will now be eligible for this office.

Extending the Powers of Nomination.

On the other hand, the proportion of three Associate Members and three Associates now serving on the Council will be altered to four of the former to two of the latter class. A more startling change is that in future the Council will nominate only for the number of vacancies, though the obligation that three of those nominated should not have previously served on the Council still remains, with the modification that they can belong to any class of Corporate Member. Associate Members, as well as Members, will now have the privilege of nominating those of their own class to serve on the Council, and the nomination and election of new officers will take place between May 31st and July 8th instead of between March 31st and May 8th as at present, to avoid pressure on the staff.

These alterations tend to throw the responsibility of electing a Council which shall carry out their wishes on to the general body of members, and to that extent are an advance in the right direction. At the same time they will more clearly differentiate between unofficial and official nominees.

Less Democracy.

Less democratic is the placing of the carrying out of the affairs of the Institution more securely in the hands of the Council by making reference to the general body of members only necessary when questions relating to the sale of the building or sinking fund policies have to be decided, though this is probably more apparent than real, as the general body of members have a fairly good check on the Council's doings at the annual election if they would only take advantage of it. That being the case it is to be hoped that these changes, which do not amount to very much, will be adopted so that the Institution can settle down to its new career. We shall look forward to the discussion with interest and hope that the various speakers will stick to the point.

Regenerative Braking and Single-Phase Commutator Motors*

By B. NORDEFELDT.

The author discusses regenerative braking on electric railways, especially from the point of view of the problems which arise when this is employed with single-phase traction. He points out that regenerative braking is of two kinds, that required as a speed check on long down grades and that required for bringing the train to a standstill. He describes the various methods of single-phase regenerative braking that have been used or suggested, and indicates the various advantages and disadvantages of each from the technical point of view.

One of the advantages of electric traction is the possibility of regenerating a good deal of the energy which would otherwise be lost by braking. In direct-current systems, such regeneration necessitates the use of a special exciter, but this complication has not prevented its use on a large scale, as, for instance, on the Chicago, Milwaukee and St. Paul Railway in the U.S.A.

The problem of regenerative braking on single-phase railway systems using commutator motors has long been studied. It has, however, not been put to practical use until recently on the Erstfeld-Bellinzona St. Gotthard line in Switzerland. As the question single-phase *versus* direct-current traction is now of great interest in many countries, an outline of the most important systems of single-phase regenerative braking will not be out of place.

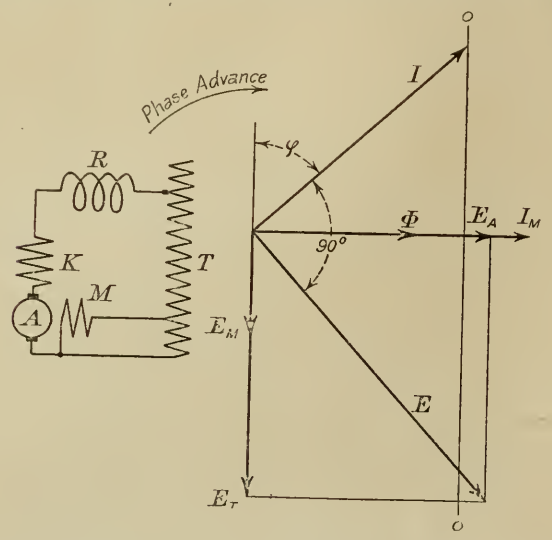

Fig. 1. Fig. 2.

Diagram of Connections and of Vectors, pure shunt excitation

The question whether such braking is economically warranted depends upon a number of circumstances, such as power economy, topography and traffic arrangements. The price of each unit saved must of course be sufficient to compensate for the increase in first cost. Whether the regenerated energy can be utilized depends in some degree upon the intensity of traffic. Long grades are an important factor in the economy of such a system. In direct-current (as also in three-phase) systems it has not generally been possible to regenerate energy otherwise than on long down grades. It will be shown below that the single-phase system, on the contrary, can be advantageously arranged in such manner as to regenerate a good deal of the energy by braking to a standstill. In such cases regenerative braking may be useful even when the topographical conditions are not favourable, for instance on local lines with frequent stops.

Different Systems of Regenerative Braking.

In describing the different systems hitherto proposed for regenerative braking, experiments with series excitation are excluded as being of only negative interest. Theoretically† as well as practically it has been proved that the single-phase series generator is unstable without the insertion of large ohmic resistances, which consume the major part of the generated energy. This system is, therefore, not applicable to regenerative braking in the proper sense, but only to a combination of such braking with resistance braking.

The methods of true regenerative braking comprise various schemes, from pure shunt to separate excitation, inclusive. The best survey of these systems is obtained by starting from the pure shunt machine and regarding the others as modifications thereof.

Pure Shunt Excitation.

The diagram of connections for the shunt generator in its simplest form is shown in Fig. 1. *A* is the armature, *K* the compensation, winding (which may include a separate commutating winding), *M* the magnet winding and *T* the secondary of the transformer. As the magnet winding has only a small number of turns, it cannot, of course, be connected in parallel with the armature and compensation windings, but must be connected to a portion only of the transformer winding. The result with respect to the machine characteristic is, however, the same.

If the ohmic resistance and other losses are neglected and attention is paid only to the reactance, the voltage and current diagrams of the machine are shown in Fig. 2. Here E_T is the transformer voltage on the armature circuit, and E_M the voltage on the magnet winding, which is exactly in phase with the former. The excitation current I_M, the flux Φ and the armature E.M.F. E_A are 90 deg. behind E_M. The armature E.M.F. combines with the transformer voltage E_T to give a resultant voltage E, and thereby an armature current I which is determined by the resultant reactance of the circuit and is in quadrature with E.

It is obvious that to keep this armature current within reasonable limits the circuit must contain several times the reactance which is permissible from the power-factor point of view. If it is to be possible to use the pure shunt motor, it is therefore necessary to insert a large additional reactance in the armature circuit (in Fig. 1 referred to as *R*). If it is assumed in a certain case that the two voltages E_T and E_A are equal, their resultant will be $E_A\sqrt{2}$. For keeping the current at the normal value of the machine the additional reactance must then be provided for a kVA value which is above that of the transformer.

The Braking Torque.

The braking torque is determined by the product of the flux and the projection of the current on that flux. With the above assumption it will be proportional to $\frac{I\Phi}{\sqrt{2}}$. It is obvious that a change in the speed does not alter the torque. For Φ being constant, E_A varies in proportion to the speed, but, as I is increased or decreased, its angle with respect to Φ varies so as to keep the projection thereon constant. This property—of giving a constant braking torque at all speeds, if the impressed voltage and the flux are constant—is a characteristic not only of the pure shunt generator, but also of the modifications which are described below. The

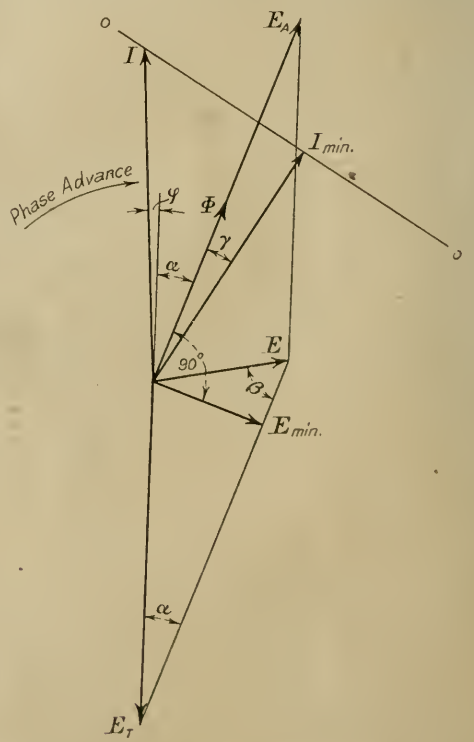

Fig. 3.—Vector Diagram corresponding to Fig. 8.

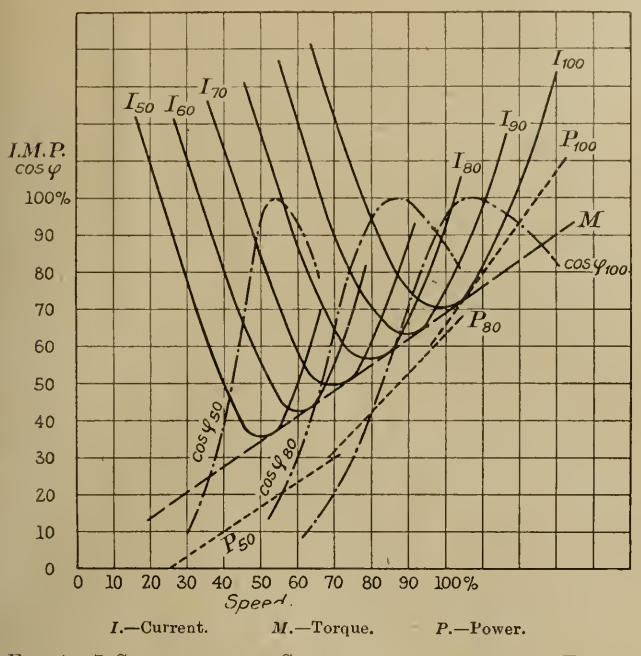
ohmic and other losses must, however, be negligible in comparison with the reactances.

In the machine described this condition can be regarded as practically fulfilled, because the reactance of the magnetic circuit is always large and that of the armature circuit is increased by artificial means. It is, therefore, superfluous to consider the case where the ohmic losses or the ion losses cannot be neglected,



I.—Current. *M.*—Torque. *P.*—Power.

FIG. 4.—7 CHARACTERISTIC CURVES FOR CONNECTION IN FIG. 8.

especially as this case will be reviewed in connection with the general theory of the generator with a phase displacement between the excitation and armature voltages.

If the excitation is assumed to be such as to give a generated voltage equal to the normal transformer voltage at normal speed, the ratio of the braking torque to the normal motor torque of the machine (at the same excitation) is as that between $\frac{E_T}{2\pi c(L_R+L_A)}$ and the normal full load current I_n. If it is further assumed that the generator current is limited to the value of the normal full load current, we obtain $I_n=\frac{E_T 2}{2\pi c(L_R+L_A)}$. The constant braking torque will thus only be $=\frac{1}{\sqrt{2}}$ of the motor torque at the same excitation, while on the other hand L_R+L_A must be $=\frac{E_T\sqrt{2}}{2\pi c I_n}$. As L_A in all normal series motors is only a small fraction of this value, the additional reactance must be practically equal thereto, *i.e.*, it must be designed for 40 per cent. more kVA than the transformer. If this reactance is reduced, the result will only be that the transformer voltage as well as the excitation must be reduced to keep the current within reasonable limits. As stated above, the braking torque is equal to the product of these two factors. If the main object of regenerative braking is to save the mechanical brakes on long downward grades, it is not advisable to make the braking torque less than 0·7 times the motor torque at a corresponding speed.

Braking Torque and Speed.

As already stated, the braking torque at constant excitation and transformer voltage is independent of the speed (because E_A is directly proportional to n). The generated power is, therefore, by the same assumption, directly proportional to the speed. The current vector in Fig. 2 moves with its end along the straight line $o-o$ which thus can be referred to as the current diagram. The minimum will be at the state of rest when φ is 90 deg., as no power can be transmitted to the line.

The necessity of using a reactance coil designed for more kVA than the transformer is obviously a disadvantage of this system. Another disadvantage is that the power factor of the regenerated current will usually be low. In the example above referred to it will not exceed 0·7 at full load. By increasing the excitation 25 per cent. and reducing the transformer voltage in proportion it can be increased to 0·84. This necessitates, however, a 5 per cent. increase in the reactance to keep the current within reasonable limits.

In spite of the necessity of the large reactance, which both increases the weight and necessitates additional space on the locomotive, this system is the only one which has hitherto been used in practice. The explanation lies in its great simplicity, which must be sacrificed if the other disadvantages are to be lessened.

Phase Displacement of the Machine Flux.

It is obvious from the diagram in Fig. 2, that the resultant voltage E is considerably reduced for constant values of E_T and E_A by increasing the angle between the latter above 90 deg. An example of a diagram thus modified is shown in Fig. 3, where the supplement angle of that just mentioned is called α. In this diagram the losses in the armature circuit have also been taken into account. Its angle of losses is γ. Fig. 3 can then be considered as the general diagram of a single-phase commutator generator with constant excitation, operating on constant voltage.

If the same symbols are used as before, we obtain:

$$\sin\beta=\frac{E_T}{\sqrt{E_A^2+E_T^2-2E_AE_T\cos\alpha}}\cdot\sin\alpha;$$

$$I=\frac{E_T\sin\alpha}{2\pi c(L_R+L_A)\sin\beta};$$

braking torque $$M=\frac{30}{\pi n}E_AI\sin(\beta+\gamma)$$

$$=\frac{30}{\pi n}\cdot\frac{E_A}{2\pi c(L_R+L_A)}\cdot[E_T\sin(\alpha-\gamma)+E_A\sin\gamma]$$

$$\varphi=\alpha+\beta+\gamma-90^\circ;$$

regenerated power $$P=E_TI\sin(\alpha+\beta+\gamma).$$

The expressions derived in the last section are easily shown to be special cases of those above, by putting $\alpha=90^\circ$ and $\gamma=0$.

Torque at Constant Excitation and Voltage.

At constant excitation and transformer voltage the torque will no longer be constant, but will increase with the speed. It is easily found to be a linear function thereof, which will also be the case with the regenerated power. The current diagram will still be a straight line, $a-a$ forming the angle $90^\circ-\gamma$ with E_A. Its distance from the origin depends on the scale chosen and will obviously represent the minimum current which is obtained for $\beta=90^\circ$, *i.e.*, $E_A=E_T\cos\alpha$. The current may also lead the transformer voltage in phase, so that the generator delivers

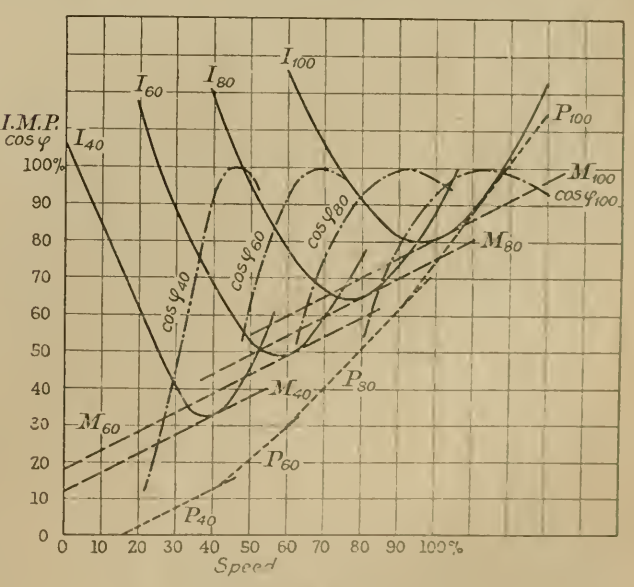


FIG. 5.

reactive power to the line. The condition, therefore, is that $\alpha+\beta+\gamma<90^\circ$. As α and γ are constant, φ solely depends on β, which grows when the speed decreases. It is thus only at the higher speeds that reactive power can be delivered.

The characteristic curves for a machine with excitation of this type for different values of α are shown in Figs. 4 to 7. The angle γ is in all cases equal to 11 deg. 30 min. which corresponds

to an ohmic resistance equal to 1·5 of the total impedance. The angle a in Fig. 4 equals γ, in Fig. 5 $\sin^{-1} 0{\cdot}3$, in Fig. 6 $\sin^{-1} 0{\cdot}5$ and in Fig. 7 $\sin^{-1} 0{\cdot}8$.

The curves for current I, torque M, $\cos\varphi$ and regenerated power P as functions of the speed are drawn for a certain excitation and different transformer voltages. The values are given in percentages of the normal ones. Indices for the different quantities represent the corresponding transformer voltage as a percentage of the normal.

In Fig. 4 six different values of the transformer voltage are assumed. The total impedance in the armature circuit is chosen

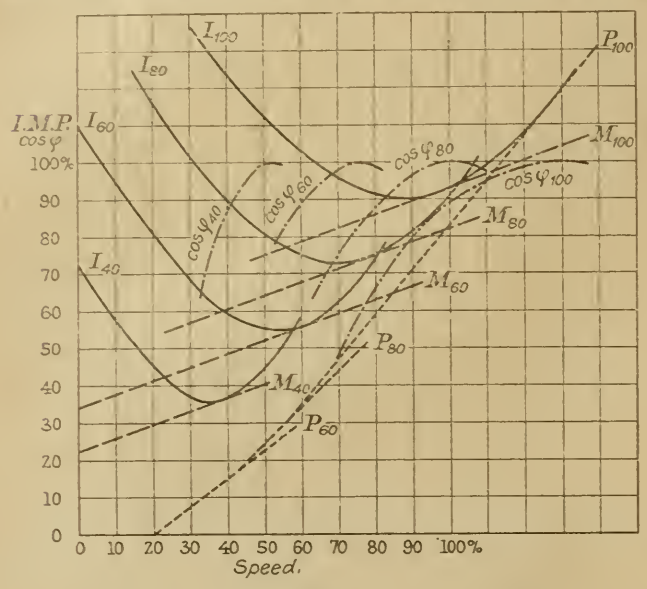

Fig. 6.

so as to make the current about equal to 1·3 times the normal at 1·3 times the normal speed. The impedance voltage in this case will be 0·288 of the transformer voltage, or only about 1/5 of what is required with the connections shown in Fig. 1. This advantage is, however, compensated to a certain extent by a sharpening of the minimum of the current curve so as to cause large current fluctuations for comparatively small speed changes. Instead of at rest, as in Fig. 1, the current minimum is in this case obtained at nearly full speed with full transformer voltage, and below this

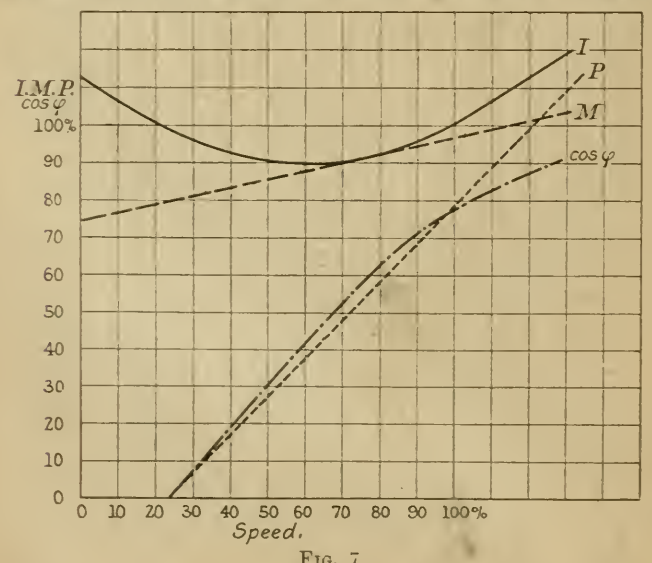

Fig. 7

speed the value rises as fast as above it. Braking with an excitation at this phase angle therefore necessitates the use of several voltage steps for the armature or for the excitation, and the motorman must be relied upon to shift the controller position at the right moment so as not unduly to overload the machine. For braking down, three controller positions can be employed corresponding to 100, 80 and 50 per cent. of the normal transformer voltage. A speed of 12 per cent. of the normal speed can thus be reached without exceeding the normal current by more than 30 per cent.

A remarkable feature of this diagram is that the braking torque, instead of being constant, as in Fig. 1, varies in exact proportion to the speed and at the same time is independent of the transformer voltage. This is due to the fact that the angles a and γ are equal, as can easily be seen from the expression for the torque.

Torque Variation Questions.

Whether a variation of the torque with the speed is desirable or not depends on whether the main object of the braking is to provide safety on downward grades or to utilise the energy in stopping. In the former case, a braking torque increasing with the speed has the advantage of stabilising the action, but in the latter it should be as nearly constant as possible.

The power factor and regenerated power are shown in Fig. 4 only for the three transformer voltages 100, 80 and 50 per cent. The first named one is found to have its maximum (= 1) at the speeds which make $E_A = 1{\cdot}07\,E_T$. Above this speed there is a leading current. At lower speeds the power factor sinks rapidly to zero, the whole power being degraded in ohmic losses. This is as might be expected. The curves for the regenerated power are straight lines, which are easily found to be tangents of a parabola which in turn touches the current curve for full voltage at the point where $\cos\varphi = 1$.

In Fig. 5, which corresponds to $a = \sin^{-1} 0{\cdot}3$ and an impedance voltage of the complete armature circuit equalling 0·375 of the transformer voltage, two controller positions should be sufficient for braking down from 1·3 times normal speed to rest. The power is, however, better utilised and the machine more lightly loaded if one or two intermediate positions are added.

In Fig. 6, which corresponds to $a = 30°$, and an impedance voltage of 55 per cent., the conditions are still more favourable for braking to standstill. Fig. 7, with $\sin a = 0{\cdot}8$ and an impedance voltage of 89 per cent., approximates to the condition shown in Fig. 1. The full transformer voltage may here be used down to rest without inconvenience.

(To be concluded.)

Review.

The Absolute Relations of Time and Space. By A. A. Robb, Sc.D., D.Sc., Ph.D. (Cambridge: University Press.) Pp. viii.+80. 5s. net.

This little book is intended as an introduction to the author's "Theory of Time and Space (1914)," and also as a summary which will convey to a larger circle of readers the main results arrived at in that work, which was prompted by his dissatisfaction with Einstein's foundations, more especially his view that events could be regarded as simultaneous to one observer and not to another, which seemed to destroy all sense of reality of the external world and to convert the physical universe into a nightmare. Assuming the correctness of the proofs, given only in the larger work, the author has succeeded in formally developing a theory of time and space based upon twenty-one postulates involving only the relations of *before* and *after*, and leading to the conception that spatial relations are to be regarded as the manifestation of the fact that the elements of time form a system in a conical order which is capable of analysis in terms of the relations of *before* and *after*. The conical space-scheme, which forms, as it were, a scaffolding, guiding the author in the selection of his postulates and in the general development of the formal argument, and greatly assisting the reader in following the latter, is so suggestive from the very beginning of the geometry of the Minkovski space-time as to make it a question of interest to the reader whether or no it was suggested—consciously or subconsciously—by the latter.

With respect to simultaneity, the view developed and shown to be logical is that of the instants corresponding to two events of which an observer is directly conscious, or pertaining to the same particle, one must be after the other, but that otherwise an instant may be neither before nor after a given instant without being identical with it; that, in fact, the present instant does not extend beyond here. The logical or mathematical development, which demands no more from the reader than a knowledge of Euclid's Elements, leads to a fourfold space-time, containing within it a threefold formally identical with ordinary Euclidian space, and two other threefolds corresponding to the two types of Lobachevsky geometries. Co-ordinates are then introduced, still by merely descriptive methods, employing only the relations of *before* and *after*, and being physically interpreted in optical terms, or by means of any physical criterion of *before* and *after*, such that the relations denoted by these terms satisfy the postulates, there emerges a fourfold Euclidian space-time, in which there is no absolute distinction between rest and motion, and is, in fact, the Minkovski space-time. The author shows that the various complex geometries of Einstein's gravitation theory may be derived from this by simple modification of the measure of interval in the space-time, from which he concludes that the space-time is the essential thing and that the complex geometries are merely analytical developments useful for special purposes.

Directional Transmission of Electromagnetic Waves for Navigational Purposes.*

By J. ERSKINE-MURRAY, D.Sc., and J. ROBINSON, Ph.D.

The Paper criticises the differences between directional transmission and reception as used in navigation and describes in particular a number of directional transmission methods which have been developed by the Royal Air Force. The methods include several in which the determination of a bearing depends on the timing of the moment of equality of signals as heard in the receiver, and also a new class of directional transmitters in which a characteristic of the radiation, such as a particular wave-length, is allotted to each direction in azimuth.

In directional reception special apparatus is carried by the craft by means of which the bearing of any ordinary transmitting station within range can be obtained. On the other hand, the determination of the bearing of a directional transmitter can be made either, as in some of the new methods described below, with the ordinary wireless receiving gear alone, or, as in others, with only the addition of a stop-watch or some equally simple accessory. The entire directional part of the system is in the transmitter.

So far the results obtained with directional transmission systems recently tried in the R.A.F. indicate that there is a prospect of obtaining as great an accuracy of observation as with the receptional systems.

The usual methods of direction finding depend on the assumption that the electromagnetic waves travel with the electric vector vertical and the magnetic vector horizontal, and in consequence the directional apparatus has an axis of rotation which is vertical. If the magnetic vector is not horizontal there will be errors of observation when using such a system.

Another factor on which accurate observation of direction from ordinary transmitting stations depends, is that the waves should be simple plane waves. It is known, however, that in many cases the waves are not simple, but that reflection or refraction occurs in the atmosphere,† thus causing a complex wave to arrive at the receiving station. The receiving apparatus does not resolve these various influences, but gives a result depending on the relative intensities, directions of propagation, orientation of the vectors and phases of the various components which may or may not coincide with the true bearing.

In the case of directional transmission, on the contrary, orientation of the electric and magnetic vectors has no direct influence on the accuracy of bearing, assuming that the waves are simple.

Types of Directional Transmitter.

The methods available for giving a directional system capable of rotation are as follows: (1) A loop aerial which is rotated. (2) A series of horizontal aerials radiating from a centre, a switch being used to change from one to the other. (3) A single horizontal aerial which is capable of rotation. (4) The Bellini-Tosi system of aerials. (5) Braun's or Bouthillon and Pettit's arrangements in which complex radiation curves may be obtained by variation of phases in the aerials. Experiments were made with the Bellini-Tosi system, but the difficulty of obtaining the accuracy required was so great that work on it has been postponed. With regard to the Telefunken system, the fact that the aerials are separated by 4 deg. introduces discontinuities which are objectionable. The use of rotating loops is limited by the fact that the radiation from loops is much smaller than with open aerials.

Timing Methods.

The first method of timing is one in which the directional beacon radiates waves which are a maximum in one direction and a minimum in another direction. The whole system is made to rotate in a definite period, say, 60 seconds. A special signal is sent out when the maximum or the minimum radiation is in some predetermined direction. This special signal should preferably be sent out by an aerial system which radiates equally in all directions. A distant observer will record the interval between the special signal and the instant of his maximum or minimum radiation, and thus obtain his bearing from the beacon. Accuracy cannot be obtained by using the maximum signal, and the observer must observe the minimum signal, noting usually the instant when the signal disappears and that at which it appears again, and taking the mean of these two observations as the instant of his minimum. The Bellini-Tosi radio-phares erected in France, and the German "B and C" stations are examples of this method.

If it were possible to concentrate wireless energy of ordinary wave-lengths into one direction, *i.e.*, into a form of searchlight beam, it would be possible to determine a bearing by the maximum signal. Using very short wave-lengths such a method is possible and has been realised by Round and Franklin, but involves the installation of special receiving aerials and apparatus on ships and aircraft.

The Use of Audible Signals.

Instead of using the minimum signal it is possible to use audible signals for purposes of observation, and such a method is very advisable for aircraft purposes, and is used in all the new methods described below. One manner of doing this is the reverse of the R.A.F. receptional system of direction finding. Two loops a and a^1 at right angles to each other (see Fig. 1) are used for transmitting purposes. These loops are joined in series through a reversing switch r, and have also in circuit a tuning condenser t and the secondary coil s of an oscillation transformer. Power is led to the aerial system through the coupling system p. The aerial system a and a^1 is made to rotate at a uniform rate, say, 60 seconds per complete rotation, and the reversing switch continuously operated, say, two to four times per second. A distant observer will hear a series of signals which will usually be in the order: loud, quiet, loud, quiet. However, when either of the aerials a or a^1 is pointing towards him the successive signals will be of equal intensity. This instant of equality of signals is what he requires for observation purposes. A special signal will be required when either of the aerial coils a or a^1 is in a predetermined direction. This special signal may be made by the aerial coils or by a special equi-radial aerial system. In this case, however, the

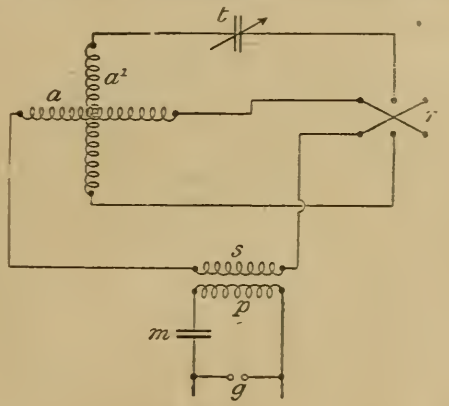

FIG. 1.

equi-radial system is scarcely necessary, as signals are audible in any case in all directions. To prevent the ambiguity of 90 deg., which is present if the two aerials are of the same dimensions, it is advisable to make one of these aerial coils of larger dimensions than the other.

Revolving Aerials at Right Angles.

Another method which enables signals to be heard continually makes use of two revolving aerials at right angles radiating waves of slightly different wave-lengths. In the case of continuous waves the difference in wave-length is so small that the waves heterodyne one another and a note is heard in any receiver. If a local heterodyne is added a chord is heard constantly, except when one of the aerial coils is at right angles to the line from the observer. Instead of recording a minimum, the observer listens for the disappearance of the chord. By making the two waves differ only very slightly, instead of a chord being heard in the receiver it can be arranged that a beating note is heard.

The disadvantage of the preceding methods lies in the fact that a considerable time may elapse before a bearing can be obtained. In order to obtain accuracy of observation it is essential to make the period of rotation fairly long, not less than 2 minutes for 360 deg. For aircraft whose speeds are large this may be troublesome.

An automatic timing method has been suggested to make the observations more or less instantaneous.

Special Characteristic Methods.

The principle employed in special characteristic methods is to radiate waves having some special physical characteristic for every orientation of the transmitting system.

One example of the new method is to vary the wave-length

* Abstract of a Paper read before the Wireless Section of the Institution of Electrical Engineers.

† J. Erskine-Murray: Proceedings of the Wireless Society, "Wireless World," 1920, Vol. 7, p. 651.

continuously during rotation of the beacon, and here we have the introduction of a new principle in directional transmission, for in this case the physical characteristics of the wave depend on the orientation. Suppose that the form of the aerial is such that the energy is being radiated in the ordinary figure-of-eight diagram. The aerial is rotated carrying its beam of radiation with it; as the bearing changes, however, the wave-length emitted is altered. In this case the arrival of any given portion of the radiation curve, such as the maximum or minimum, at a given bearing, will always take place on a definite wave-length. If the receiver is therefore able to distinguish either a maximum or a minimum its bearing from the transmitter can be determined by measurement of the wave-length. By recording at the observing station the wave-length of the minimum or maximum signal, or for any other definite position on the directional curve, the bearing is at once known.

It must be noted that although the wave-length of the radiation from a variable-wave beacon may be varying through quite a large range, it does not jam this range of wave-lengths at all, as the radiation on any given wave-length is only emitted for an infinitesimal fraction of the time of each revolution.

The Determination of the Decrement of a Distant Station.*

By J. ERSKINE-MURRAY, D.Sc., and B. WILLIAMS, B.Sc.

The determination of the decrement of a distant station depends on the equalisation of received currents without measurement of their absolute values. If a loop is placed with the plane of its winding pointing in the direction of a transmitting station the electromotive force induced in it is a maximum. If the loop is inclined at an angle to this direction (hereafter called the bearing) the induced E.M.F. is proportional to $E_{max}\cos\theta$. If $\theta=45°$ then $E_{45°}=E_{max}\sqrt{2}$, or if the coil is in resonance with the transmitter $I_{45°}=I_{max}\sqrt{2}$.

In the usual method of determining the decrement of a transmitter a receiving circuit consisting of a coil, condenser, and thermometer is coupled to the transmitter, and the two valves of capacity C_1, C_2, are noted at which the current in the circuit is $I_{max}\sqrt{2}$, where I_{max} is the current at resonance.

If d_1 = decrement of transmitter and
d = decrement of apparatus,

then
$$d_1+d=\pi\frac{C_2-C_1}{C_2+C_1} \quad \ldots\ldots\ldots\ldots\ldots\ldots \quad (1)$$

The Loop Aerial.

In the case of the loop aerial (assuming the signal strength to be proportional to the received current) inclined at 45 deg. to the bearing, the signal strength is $I\sqrt{2}$ times the signal strength when the loop is on the bearing—it being understood that resonance is obtained in both cases. If now the loop on the bearing be detuned on either side of resonance until the signal strength is equal to that obtained with the loop at 45 deg. and in resonance, then the capacity values so obtained may be substituted in Equation (1) and the total decrement of the transmitter and apparatus be determined. The conditions to be fulfilled and the general procedure to follow are therefore:

(1) Find the bearing by any suitable method.
(2) Set the loop at 45° to bearing and tune accurately. Note the signal strength.
(3) Set the loop on bearing and detune on either side of resonance until signal strength is equal to that obtained in (*b*). Note the capacities C_1 and C_2 and hence determine d_1+d.
(4) Find d (= the decrement of the apparatus) by a continuous-wave method. d_1 is then determinate.

Determination of Total Decrement.

Two possible methods can be adopted, namely: (1) The visual, and (2) the aural.

(1) *Visual method.*—This is the more accurate method and is less complicated than method (2); it is, however, only applicable to strong signals of a regular character where there is no appreciable interference. One coil and one condenser are required. The signals on the bearing are equalised with those obtained on the 45° to bearing position, by making them produce equal effects in a recording instrument. Using a 7-valve amplifier across the coil and tuning condenser, the two signals may be said to be equal if they produce the same drop in the anode current of the last valve.

(2) *Aural method.*—In this method the signals on the bearing are made equal to those obtained on the 45° position by comparison in telephones.

This method is not so easy or accurate as the visual method; it can, however, be employed on weak signals and, with good operation, can be used on ordinary routine transmission. It is the only suitable method where there is appreciable interference.

Two coils and two condensers are required, as it is obviously impossible to keep in mind the strength of the signal on the 45 deg. position during the time it takes to turn the loop back on to the bearing. The two coils must (*a*) have the same inductance and decrement, (*b*) have the same area-turns, (*c*) be set accurately at 45 deg., and (*d*) be provided with a change-over switch which renders one coil dead when the other is in action, thus preventing any mutual induction effect.

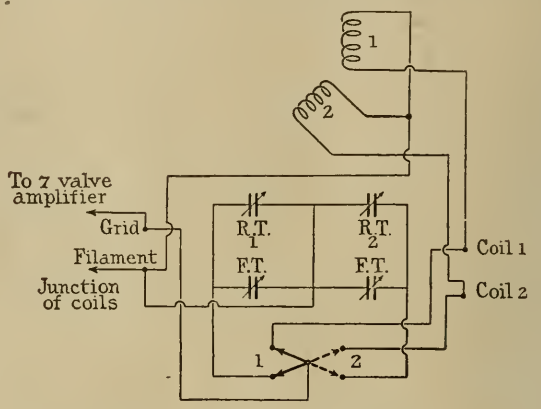

FIG. 1.—TELEDECREMETER CIRCUITS.

There are various methods of determining the decrement of a circuit; of these the easiest of application is that of determining the resistance of the circuit, using as excitation continuous waves of the required wave-length. A description of these methods has been given in "Circular of the Bureau of Standards," No. 74, entitled "Radio Instruments and Measurements.

DISCUSSION.

The above Paper was discussed jointly with one on "Directional Transmission of Electromagnetic Waves for Navigational Purposes," an abstract of which appears on page 315 of this issue.

In opening the discussion Capt. H. J. ROUND questioned the accuracy and novelty of the methods suggested in the Paper for the measurement of decrement. The definition of decrement with which he was familiar was the logarithmic ratio of two successive maxima in any wave train. The formula given in the Paper depended upon a comparison of R.M.S. values. Actually the method relied upon equality of signals, and these being rectified did not vary as their R.M.S. values. He considered that the apparatus was no more than a decroscope. In 1908 he had produced a similar instrument which had been criticised by Prof. Fleming for reasons similar to those which he now put forward. Another point to remember was that for the useful measurement of decrement the whole resonance curve must be investigated; the taking of only two points was useless. At this stage of development something was wanted with a good theoretical basis.

Major H. P. T. LEFROY emphasised the need for selective receivers in connection with the methods described in the second Paper, not only on account of jamming but also for use with the system in which the wavelength was varied as the beacon rotated. For standardising receivers for use on various wavelengths he advocated heterodyning all incoming signals to one standard supersonic frequency.

6s. 8d. an Ounce.

Wing Commander J. B. BOWEN explained that the origin of the decremeter described by Major Erskine-Murray lay in the need felt by the Services for information regarding the degree of interference caused by stations, and the number that could be placed in a given area. They wanted figures for tonic train and high-speed transmitting stations. There was much to be said for the Robinson directional receiver, but there was a fly in the ointment, he might even say there were nails in the wood! And they were due to the added weight when this system was applied to aircraft. In the unlikely event of his brain being examined when he was dead, he thought there would be found upon it the words "6s. 8d. an ounce," for that was the extra cost of construction of engine and machine for every additional ounce which had to be carried. The direction-finding gear had presumably to help a pilot find his landing ground when visibility was bad, and he could picture a machine coming towards an aerodrome equipped with one of the beacon stations described. Under probable conditions the machine would circle round the station about once in two minutes, and would therefore be

*Abstract of a Paper read before the Wireless Section of the Institution of Electrical Engineers.

putting up quite a sporting race with the signal which was to guide it!

Capt. J. Hollingworth considered that the use of a 2 V cell and a potentiometer was simpler than an extra valve for balancing the d.c. component in the anode circuit when measuring the drop of anode current in the determination of decrement. He doubted whether a receiver had the same decrement for tonic train as for C.W. He did not find decrement to vary with signal strength.

Practical Difficulties.

Mr. R. L. Smith-Rose pointed out a number of difficulties in the rotating beacon method of direction finding. It was not suited to the aircraft requirement of receiving on a maximum, and minimum readings were not symmetrical, since it was easier to hold on to a signal than to get it again. Also there was an error from vertical effect; and jamming was liable to make a reading impossible. With the crossed coil method the disadvantages were slow speed and lack of accuracy. He considered the change of wave-length method to be better for getting bearings quickly, but in this everything depended upon the accuracy of calibration of the receiver. He questioned the effect of a trailing aerial upon the tuning of the receiver, and consequently upon the possibility of making the latter very selective. Night errors were greater with a closed coil transmitter.

The Hard-Worked Ether.

Capt. P. P. Eckersley considered that warlike considerations had been made unnecessary by the Washington Conference. Beacon stations were not necessary for commercial work where ground stations could give a machine its bearing on request. If the machine was to take its own bearing he preferred the gear in the machine, so that it might take bearings upon all transmitting stations. The ether was a hard-worked medium, and if the proposed beacon stations were erected he would, instead of having 6s. 8d. engraved upon his brain, have hopeless jamming impressed upon his ears.

Dr. J. Robinson considered that the apparatus described in the second Paper, whether decremeter or decrescope, had its uses.

Dr. G. W. O. Howe took the flicker photometer as an analogy to the two coil transmitter and reasoned that there was, therefore, a best speed at which to work. He queried what one actually measured in the described decremeter method and advised taking the decrement of a station when actually working and not when the key was held down.

Replying to the discussion, Major J. Erskine-Murray admitted that he did not clearly understand the theoretical basis of the decremeter. By its means one got some kind of a useful measure. Someone had to start. He agreed that there was a critical speed of rotation for the beacon stations, and that a very selective receiver was not practicable with a trailing aerial.

The Manufacture of the Mullard Valve.

The references to the design, output and production of the thermionic valve in the recent report of the Imperial Wireless Commission and especially the comparisons of valves contained in glass and silica containers respectively have aroused much interest in the manufacture of this important apparatus. Indeed, the wide use of the thermionic valve for both wireless telegraphy and telephony makes it necessary that close attention should be paid to its manufacture, as it presents problems which are just as interesting as those which have been found and overcome in more technical fields. As electrical engineers we are convinced by this time of the necessity of employing proper organisation and well thought out processes in manufacturing equipment of all kinds, and though we cannot perhaps claim that high efficiency of mass production which is seen, for instance, in motor-car and margarine manufacture, there is no doubt that definite economies can be obtained by careful attention to detail and a well thought out line of progress through the shops.

A Lamp Analogy.

That this has been done in at least one case is evident from a visit we recently paid to the works of the Mullard Radio Valve Company, Ltd., where the valves, to which such interesting reference was made in the report, are now being turned out in large quantities. While the company will doubtless be among the first to acknowledge the debt they owe to those pioneers who thought out the processes necessary for the production of the vacuum and gasfilled lamps on a large scale the special problems which have to be met in producing a valve, which will operate satisfactorily under ordinary working conditions and with relatively unskilled supervision, has meant that many steps have had to be taken along the lines we have just indicated.

Mullard Valves for Reception.

We may first deal with the small valves which are manufactured by the Mullard Valve Company for receiving purposes. These valves are made in a variety of patterns of which we illustrate examples (Figs. 1 and 2). Type R, which has an overall length, including pins, of 4½ in. and a bulb diameter of 2¼ in. works best with about 4 V on the filament, and 60 to 80 V between anode and filament. In the K type, which is rather more compact, about 3·5 V are required on the filament and 20 to 30 V between the anode and filament. This particular type of valve is suitable for use in high frequency amplifiers. The D type valve is a slightly soft valve designed for use in detecting or rectifying signals prior to low frequency magnification. It operates best at about 5 V on the filament and 20 to 30 V between the anode and filament. The essential parts of all valves of this kind are, of course, the glass bulb, the grid, the anode and their supports, the leading-in arrangements, and the metal cap.

Manufacturing Details.

The problems connected with the manufacture and assembly of the bulb and cap of the valve are not dissimilar to those met with in lamp manufacture and are therefore well known. We may, therefore, confine our description to dealing with the methods employed in manufacturing and mounting the more peculiarly wireless portions of the apparatus.

Referring particularly to the small type of valve, as is of course usual, the leading in wire is of platinum. To the outer end of this leading in wire is welded a copper wire by which external connections are made to the valve cap, while to the inner end is welded a nickel wire which is used for supporting the electrodes inside a closed stem. The valve electrodes are made from sheet nickel and molybdenum and tungsten wire. The former is stamped out to

Fig. 1.—View of the "R" Valve.

the correct size and is welded to one of the nickel supporting wires by means of a small electric welder. It is then shaped round to give it the desired cylindrical shape.

The Grid.

The grid to which the other nickel wire is connected is built up of molybdenum wire, which is coiled into a spiral. For the proper

production of both these parts, well designed jigs and tools are employed so that exact reproduction in every essential is secured. For instance, the molybdenum wire is wound on a special machine in the form of a spiral which subsequently passes into a closed tube for protection. Lengths can then be cut off as required. An automatic device is employed for cutting off uniform lengths of glass tubing to form the sealing stems for the valves. These lengths of glass are then fed by hand into a flanging machine which consists of two chucks which in turn grip the piece of tubing and bring it into the blow pipe flame where the flange is worked on to it. The four supporting wires for the electrodes are sealed into one end of this flange tube so as to form the stem.

Fig. 2.
The "K" Valve.

Filament Construction and Mounting.

After the grid and anode have been mounted on their supporting wires the filament is threaded down the centre of the grid and secured to the terminal wires by pinching. The necessary tension on the filament is maintained during working by placing a small flat spring between it and its support.

The grid, anode and filament, which are mounted together on their glass support, are then inserted in the bulb, which is either of a spherical or elongated cylindrical shape, being afterwards exhausted by a vacuum pump in a way similar to that used in lamp manufacture. During this exhaustion the valve is subjected to electrical tests so as to drive out the occluded gases from the metal electrodes and to indicate the state of the vacuum. This is effected by employing extremely high voltages which heat up the electrodes by electronic bombardment. The total occlusion of the gases is indicated by the disappearance of all the blue glow, and the valve is then sealed off from the pumps. In connection with this high voltage work which, of course, is a special feature of the valve manufacture great care is taken by means of automatic devices to prevent any danger of live high tension parts being touched by the operator. The valves themselves and the high tension terminals are protected by specially constructed cages, which can only be removed when the current is off.

Testing Arrangements.

Subsequent to exhaustion the valve is subjected to a short ageing run, and afterwards to careful testing. In these tests the filament current is adjusted until the required total emission is obtained when using a given anode voltage. The filament voltage and current are then read off by appropriate instruments, and the results must fall within certain predetermined limits, or the valve is rejected. The grid current is then measured by applying a voltage to the grid, which is negative with respect to the negative terminal of the filament. For hard vacuum receiving valves this current (or backlash) must not exceed 0·2 micro-ampere. The grid voltage is then reversed, and the value of the positive grid current is noted. This must not exceed 2 micro-amperes.

Transmitting Valves.

So far it will be gathered that the manufacture of these small receiving valves does not differ much from that usual in the preparation of incandescent lamps. Owing, however, to their larger size the construction of valves for transmission purposes necessitates the introduction of certain modifications. These transmitting valves are made in a variety of ranges from the smaller sizes where the anode dissipation is from 20 to 30 W with an anode voltage of 200 to 400 V and from 600 to 1 200 V respectively to those with an anode dissipation of 100 to 150 W and even up to 250 to 500 W, with corresponding increases in the anode voltage and filament current. It is interesting to note, in view of the remarks in the Wireless Commission's report, that, although the details we give below apply to valves made with glass bulbs, successful experiments have been successfully carried out using silica for this purpose with a great accession of strength and consequently life..

The Advantages of Silica.

The employment of silica not only reduces danger from breakage, but owing to the fact that the material can be brought nearer to the grid and filament a small container can be employed. The special construction used in the larger type of Mullard transmitting valves produces, we are informed, exceptionally long insulating paths between both the anode and grid and the filament. It also has the great additional advantage of making it possible for the valve filaments to be renewed by the makers, thus reducing the maintenance cost of valve installations. This is also dealt with in the report.

Constructional Details of Large Valves.

The filament in the case of these large valves is of loop form, and is mounted on two nickel strips which are fitted on to a special glass stem. This glass stem is of such a diameter that it will pass freely up the centre of the inner glass tube of the stem on which the grid is mounted without coming into contact with any of the grid supports or connections. The two are therefore insulated from each other not only by an air gap but by what are actually two sets of glass insulators. The grid is formed of a spiral of the molybdenum wire laced on to straight molybdenum supporting wires which themselves are carried by channel-shaped nickel strips held in place by friction on the inside of the glass tube of the grid stem. The flange end of the glass stem carrying the filament is ultimately sealed on to the outer end of the inner glass tube of the grid supporting stem. This enables the whole of this part of the apparatus to be kept completely outside the valve bulb proper, which bulb is sealed on to the flanged outer part of the grid stem. Similarly the tension spring which supports the loop-filament from the other end of the bulb is attached to a narrow glass tube which passes centrally up and is separated from the inner glass tube which supports the anode of the valve from the opposite end of the bulb. This arrangement enables the filaments to be replaced as mentioned above, for on

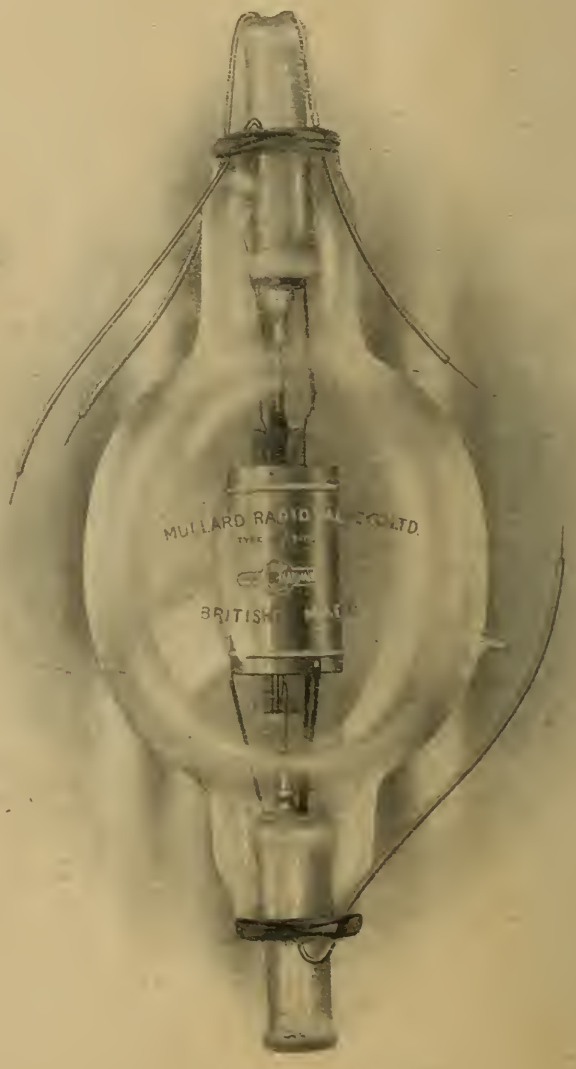

Fig. 3.—View of 0.500 Valve.

cutting through the tubes which project at the opposite ends of the valve the two small stems supporting the loop filament and its tensioning spring may be withdrawn from the valves and a new filament inserted in place, sealed in position, and the valve re-exhausted. An assembled valve of this type is shown in Fig. 3.

"Silica Valves."

In the case of the silica enclosed valves mentioned above the anodes are very much larger than those in the glass enclosed

valves. These anodes are built up of narrow molybdenum strip which is plaited into a hollow cylindrical form. Illustrations of these valves are given herewith, Figs. 4 and 5. The whole is a most interesting milestone in the development of valve manufacture.

In regard to the silica valves, it should be stated that these are made under an agreement with the Admiralty—who are joint owners

Fig. 4.—Silica Valve without Holder.

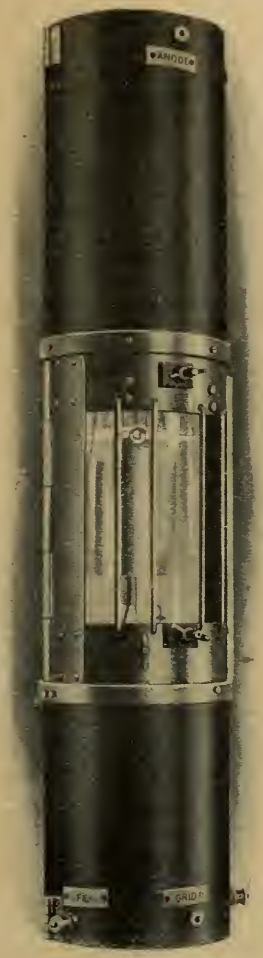

Fig. 5.—Silica Valve in Holder.

of the patents involved—most of the pioneer work in connection with the development of this type of valve having been carried out at H.M. Signal School, Portsmouth.

The large power output, and consequently aërial current, which can be obtained from a wireless transmitting installation of comparatively small dimensions by the employment of silica valves renders the employment of this type particularly advantageous on board ship. This is one of the reasons why H.M. Signal School, in conjunction with the Mullard Radio Valve Company, Ltd., has developed the silica valve to its present state. Silica valves of 2·5 kW and 4 kW rating are now being produced in considerable numbers and up to the present the whole of the output of the Mullard Radio Valve Company, Ltd., for this type of valve has been in fulfilment of Admiralty orders.

Warm Rivers or Warm Houses?

The discussion at Manchester on the two Papers by Messrs. Haden and Whysall on "The Utilisation of Waste Heat in Generating Stations" * was a model of what such discussions should be. The authors made their remarks commendably brief and pointed. Every speaker spoke well, and each contribution was relevant and rich in practical experience and suggestion, frequently enlivened with humour. Various points of view were presented. Altogether, Manchester again vindicated the value and necessity of these extra-metropolitan discussions and the delighted appreciation of the authors was no slight consolation to those who have to live in or near the city. The general attitude of the power-station engineers was one of distinctly qualified sympathy. The theoretical attractions were admitted, but the practical difficulties of commercial application were stressed. Altogether the meeting indicated a distinct tendency away from the super-station idea, an engineering reaction against centralisation not without its parallel in the political world.

* *See* The Electrician, Vol. CXXXVIII., p. 94, January 27, 1922.

Methods of Heat Distribution.

Mr. S. L. Pearce, who incidentally questioned some of Mr. Haden's figures, pointed out that in comparing energy conversions the efficiencies of transmission and application were involved. For a given amount of heat to the consumer, less coal would be destroyed at a modern super-station than at a gasworks. There were three methods of distributing heat, the first being to draw steam from a condensing engine or turbine after partial expansion, the station being considered primarily as a means of generating electricity rather than heat. Secondly, a special boiler-plant and a number of non-condensing sets giving exhaust steam for heating might be installed, the station being primarily a heating station with electricity as a bye-product, additional electrical load coming from a condensing station. In the third case, live steam might be supplied direct, as was the practice in American stations. No single method would satisfy all conditions or all localities. The first was suitable if the main station were in the centre of the heating load. The second was best for old stations where the capital cost had been written down. The main difficulties were the market for heat, the co-ordination of heating and lighting loads, the distribution of steam and the cost. There was no coincidence between the heating and lighting loads, and live steam had to be used at times—at Dickinson-street 25 per cent. of the time. Basement wayleaves had to be negotiated, and the costs of tunneling were considerable. A pre-war subway of 50 sq. ft. at Stuart Street cost £27 per yd. To-day a steam main subway 10 to 12 sq. ft. area would cost £30 per yd. Rates charged for steam should take account of varying load factors. A judicious combination of all methods of heating would be necessary in a commercial scheme.

Benefits of Central-heating Stations.

Mr. J. Frith said that offices, houses and works needing process steam formed the demand for heat, and a *liaison* should be formed between heating and electricity supplies to ensure the best service to the community as a whole. It was necessary to use the latent heat of steam, and the super-station idea was only tenable if the station were prepared to absorb surplus power from heat plants as well as to give power. The diminished consumption of domestic coal and the absence of smoke would benefit the whole community.

Mr. F. Biggin said that the use of a central-heat station was equivalent to concentrating boilers and heaters in one place, and would, by diminishing losses and labour involved, increase efficiency. In an actual case, a block of seventeen buildings on an area of 9½ acres saved £7 000 per annum by installing a combined heating, lighting and power plant. The same economies could be obtained on a larger scale.

Warming Rivers.

Mr. D. Brownlie emphasised the low efficiency of the average boiler plant, and considered that if that proportion of coal used in steam raising in the United Kingdom were employed in efficient plants 3 000 000 h.p. would be available. It would be better to give new plant to inefficient works rather than to erect it in super-stations. Power could not be generated in Great Britain in one particular way, and all methods had to be correlated. It was absurd to talk of objections to central heating, which had been used for forty years in the U.S.A. What English people needed was radiant heat, and homes should, therefore, be centrally heated throughout, with an open fire in the living-room and gas-cooking. The objection of condensation in steam distribution pipes could also be met. A modern air-insulated, lagged and buried pipe lasted twenty years and lost 0·04 lb. per sq. ft. per hour.

Co-ordination of Heat and Other Loads.

Mr. H. C. Lamb thought Mr. Brownlie ignored progress in the last twenty-five years. Coal consumption for power generation had been quartered, and if this progress could be maintained we should do well. He agreed with Mr. Haden about keeping open old stations. It was impossible to balance the heating and electrical loads. Manchester was one of the best areas for central heating. Yet out of a winter demand of 20 000 kW, 17 500 kW would have to come from a condensing station, using Mr. Haden's figure of 115 lb. per kW hour. The summer steam demand was only 10 per cent. of the winter demand, while the electricity figure was 85 per cent.

Heat Supply and Electricity Departments.

Mr. Nelson Haden suggested that if central heating developed, it should be connected with electrical rather than with any other branch of municipal activity. Electrical heating had its uses, but he did not think this would cause electrical engineers to be prejudiced against steam heating. Heating, electricity and gas making and refuse destruction might be carried on in one station, the chairman of the committee to say which source of heat was best for given conditions. Over five hundred American towns had central heating stations, all run by the electrical authorities.

The Home Idealised.

(*Continued from page* 291.)

"Tricity" Truisms.

On the stand of the British Electric Transformer Company is to be found a plethora of "Tricity" electrical apparatus, from which it is difficult to pick out points for special notice. But the newest, and presumably therefore the best, of the apparatus is the "Tricity" cooker for small families, which we illustrate herewith (Fig. 3). This is a combination cooker, the outstanding

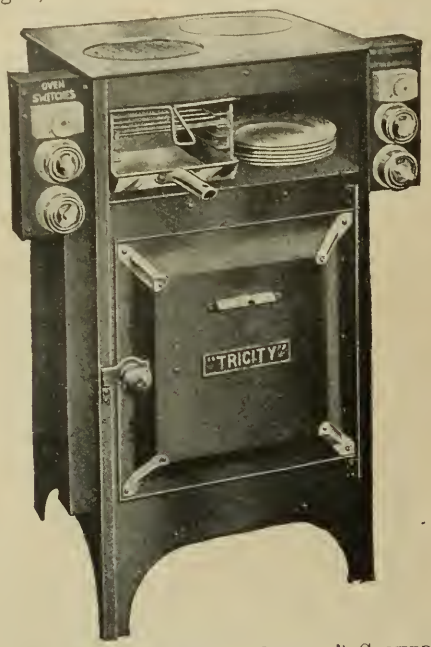

Fig. 3.—The Latest "Tricity" Cooker.

feature of which is its light loading compared with the work it will do. The loading of cooking apparatus is a question upon which a discussion can always be generated, and the "Tricity" view, in contradiction to some others, is that it is better to spend your money on the material, and especially the lagging of your oven, than in buying current all of which will not be economically used. The loading of this "Tricity" production is 3·3 kW, and it is claimed that it will do all the cooking operations necessary for a family of six. The oven has a loading of 1 400 W, 600 W in the top and 800 W in the bottom element. It consists of a sheet-steel body with double walls, between which is a plentiful supply of slag wool lagging. There are three heats on each of the elements. Even with this low loading it is claimed that a sufficiently high cooking temperature can be reached as quickly as with a cast-iron body owing to the efficient lagging. The top of the oven is of bright cast iron and is also lagged with slag wool. The internal dimensions of the oven are 14 in. by 14 in. by 12 in., and it can therefore take a joint and a sweet at one operation sufficiently large for the size of family mentioned. The elements are protected by trays and can easily be changed, being each held in place by three screws, to remove which is a simple operation. The elements themselves consist of nichrome wire wound on mica and are connected by means of bare wire carried on asbestos bridges to the control panel at the left-hand side of the oven as shown in the illustration. The switches are of the rotary type, and the fuses of the Kantark type which, it is claimed, have advantages of simplicity and easy changeability over any other on the market.

The cooker is completed by two hot-plates, one of the open type with a loading of 1 200 W and one of the closed-in type with a loading of 900 W, each with three heats. These hot-plates work in conjunction with a reflector plate. This, when placed under the element, allows boiling to be carried on on the top of the hot-plate, while, when placed over the element, the heat is thrown down, so that grilling can then be carried on in the space between the hot-plates. This space is also useful for many plates and dishes.

The British Electrical Transformer Company are also, it may be noted, advocates of control by thermometer, and one of these instruments is provided in the door of the oven. Further, it need only be added that the price of the complete equipment is £18. The boiling plate portion of this apparatus can be supplied separately, and, in addition, are to be found on the stand a wide range of irons, kettles, fires, grillers, ovens, boiling plates, pastry ovens, hot cupboards, and so forth, all eloquent of the "Tricity" idea.

How to Keep Your Bed Warm.

Another stand which absolutely teems—or should it be steams?—with electrical domestic appliances is that of the Dowsing Radiant Heat Company. Here are to be found electric boiling plates, cookers of various descriptions, hot cupboards, hotplates, irons, kettles, milk heaters, radiators, toasters, and urns, while for commercial use there are electric branders, belt trimming knives, glue pots, soldering irons and wax heaters, and for medical use there are all sorts of apparatus for giving radiant heat treatment and electric light baths. But the thing which attracted our notice was the stone bottle bed warmer. This is an interesting reversion to the days before the india-rubber hot water bottle was invented and the chilly went to bed accompanied by a pre-heated brick. These heaters are in appearance very similar to the stone hot water bottle sometimes used, and consist of a stoneware container surrounding an element. Pre-heating for about ten minutes or a quarter of an hour is necessary, and when the bottle is carefully wrapped in a flannel it will, it is claimed, keep itself and others warm for a considerable time. For the chilly, again, a small radiant bowl fire which is to be found on this stand may be recommended. It is of a pattern now well known in electrical circles, and from the excited comments which were being made by passers-by who suddenly came within its range it fulfils its purpose very well. It can be put anywhere.

Artistry in Illumination.

On the Metropolitan Vickers Electric Company's stand is to be found a good selection of their well-known Cosmos domestic electric apparatus, including a new pattern of 2 kW radiant fire designed on scientific principles both as regards reflection and radiation, and containing four elements which can be switched on in pairs. Anyone looking at this fire will agree that the element is easily accessible, and we understand that it can be removed by releasing two screws. But the more striking display on this stand is the artistic exhibition of lighting fittings which have been designed and made by Harcourts, one of Vickers, Ltd., associated firms. These fittings are produced in a number of styles such as 'Adams and Louis XV., but the actual designs have been prepared by artists working specially for the end in view, and their ideas have received special treatment, with results which are highly satis-

Fig. 4.—The Metropolitan-Vickers Stand at Olympia.

factory. We are informed that concentration is being specially made on the Adams period, but we noticed in addition candle fitting in the Baroque style, such as was largely used by Sir Alfred Gilbert and many others, and a bowl fitting of the Gothic school, which has the advantage of hiding the lamp entirely. The brackets are cunningly held from the back by means of a wall plate and hook so that no screws are visible, and as far as the fitting proper is concerned are unnecessary. The aim of the company is to apply art to everyday uses, and while the fittings are not cheap they indicate a desire to educate the public in art and to perpetuate the designs of the best periods and styles during these modern days. To those interested in beautifying their homes—and who is not?—this is a stand to linger on. Fortunately this is made more easy, as overcrowding has been avoided, and those responsible are to be congratulated on the general arrangement. How good this is is evident from Fig. 4.

Carron Cookers Collected.

On the CARRON COMPANY'S stand is to be found a display of electric cooking and heating appliances of this firm's well-known manufacture. Among these is the Carron 1922 model cooker, which is designed like a Globe-Wernicke bookcase to the extent that all the parts are separate, but can be easily pieced together to form a complete whole. An important point in this new design is that the oven is on the same level as the boiling table, being raised from the ground on a special stand, thus avoiding any necessity for stooping. The oven door is fitted with a special spring handle, and both it and the walls are suitably lagged in accordance with the usual Carron practice. It contains elements top and bottom, the former having a loading of 1 500 W, and the latter a loading of 1 000 W. There are three boiling plates of the usual Carron design, one 6 in. in diameter with a loading of 600 W, one 8 in. in diameter with a loading of 1 000 W, and one 10 in. in diameter, with a loading of 1 500 W. Over these hotplates is placed a plate rack—a useful addition, as all cooks know. In all the apparatus the element can be easily

FIG. 5.—THE 1922 CARRON COOKER.

exposed for replacement (though that is seldom necessary), and the wiring is also easily "get-at-able." This cooker is shown in Fig. 5.

Another new "Carron" is a hot-water circulator which is made in two sizes, with capacities of 30 and 60 gallons respectively, the loadings being 4 and 8 kW. The circulator proper is made of gun-metal, the body being screwed at each end to take the necessary piping. This body is suitably lagged, and the whole is enclosed in a sheet-iron case. It is very neat and compact, and can be tucked away in some corner without anxiety. The circulator can be fitted with a thermostat if desired, and once more the whole of the apparatus is easily accessible when the sheet-iron casing has been removed, and this is not difficult.

The Carron Company have long been known as manufacturers of artistic coal-grates of various designs, as well as producers of electrical appliances. Now the two activities are apparently being combined, for Carron dog-grates are shown fitted with electrical elements. The illusion is made the more complete by the use of two ruby lamps which give forth a pleasing and psychological glow. These "electrogrates" are made in any period, and for any loading up to a maximum of 6 kW with two heat regulation.

Stannos and the Home.

SIEMENS BROTHERS & COMPANY are showing a room wired for electric lighting, heating, &c., on the Stannos system and also a model in which the application of this system of wiring to housing

FIG. 6.—SIEMENS' STAND AT OLYMPIA.

schemes is demonstrated. This explanatory model shows a transformer installed in the nearest cottage to the main power cable. From the low tension side of this transformer a Stannos conductor is carried along the outside walls of each group of cottages and the supply tapped to each cottage through the main wall. Between each group of cottages the Stannos main is buried directly in the ground.

One of the leading advantages derived from introducing electric current into groups of cottages by this means is, it is claimed, reduction of cost (a not unimportant feature) as the system dispenses both with the necessity for opening the road and laying a main cable as well as opening trenches for laying the service wire into each of the cottages, the interiors of which can be wired on the Stannos system. We understand that in several housing schemes which at present are in progress this economical method of introducing electric supply is being adopted. A view on this stand is given in Fig. 6.

A Boon to Amateurs.

Amateur electricians, and professional ones too, for that matter, owe a debt of gratitude to the inventors of the wall plug variations which, in all their glory, are exhibited by the RAWLPLUG COMPANY. This simple and ingenious piece of apparatus is, as our readers probably know, invaluable in the home for such jobs as fixing shelves, bell pushes, bathroom fittings, hangers, coat hookers, wall plugs, flower-pot stands, etc. Examples of fixtures made by Rawlplugs are compared with horrible results of employing the old methods. These are enough to drive anybody who does not already use Rawlplugs to do so at the earliest possible moment.

RASHLEIGH PHIPPS & COMPANY have a large stand on which is shown one of the only methods of solving the lighting problem in the country house, that is by means of the Rashleigh Phipps standard plant, which is designed on simple and reliable lines to provide electric light at a low cost, and people with country houses might therefore do worse than use it.

The AUSTIN MOTOR COMPANY exhibit a range of their well-known Austin automatic electric lighting sets, including the 0·75 kW auto-plant, and the 2 kW auto-plant and auto-dynamo. The principal feature of all these sets is their entirely automatic character, though they can easily be made semi-automatic or even controlled by hand.

R. A. LISTER & COMPANY are showing a full range of their Liston-Bruston lighting plants, which are suitable for all sorts of installations, ranging from a cottage to a mansion. An automatic plant suitable for cottages and bungalows is also on view. No need now to be without the electric idea, even if you live in the country.

The SHERINGHAM DAYLIGHT DEVELOPMENT COMPANY are exhibiting their system of obtaining artificial daylight by means of an ordinary electric lamp in conjunction with a simple inexpensive piece of apparatus requiring no alteration of existing installations. Details of this system have already appeared in THE ELECTRICIAN, and it is claimed, with some truth, that the light is invaluable for avoiding eyestrain in the home, for fine needlework, colour embroidery, stamp collecting, and all hobbies where colour values are important.

(*To be continued.*)

Industrial Electrical Heating.

A lecture on the present position and future prospects of INDUSTRIAL ELECTRICAL HEATING was given at the University of Sheffield on Monday by Mr. J. G. Pearce, of the Metropolitan-Vickers Electrical Company, to the Sheffield Gas Consumers' Association. Sheffield is one of the largest consumers of gas for industrial purposes in the United Kingdom.

After indicating the influence on electrical heating development of the nickel-chromium resistance alloys, the lecturer considered the relative positions of gas and electricity for heating purposes, and stated that, for a given amount of heat required by a consumer, a modern super-power station used less fuel than was required in any other form of fuel conversion. The recent improvements which had been made in the manufacture of high-speed and high-capacity turbines, together with projected schemes for linking up power stations, would enable electrical energy to be procured at rates much more favourable than had hitherto been possible.

For precision heating, electricity was unapproached by any other heating agent—it was rapid, practically any desired temperature could be obtained over a very wide range, and temperature control could be obtained within extraordinarily fine limits. Electrical heating did not distort the material, and spoiled work was almost entirely eliminated. Heaters occupied a minimum of floor space and were less detrimental to workers than other forms of furnace. It was particularly important that those who were considering the installation of electrical heaters should not compare merely the cost of electrical energy with the cost of gas at the power station and gasworks respectively, as the efficiencies of distribution and application had to be considered. In electrical heating no heat was wasted through warming up the air used for combustion, and radiation losses could be cut down to a minimum.

Mr. Pearce then described a number of modern heating appliances, ranging from low-temperature applications, in the form of ovens, soldering pots and irons, cooking and heating equipment for works canteens, &c., up to the largest electrical furnaces of the resistance type, which had been developed for the heat treatment of gun forgings, &c., taking loads up to 2 800 kW and able to heat steel up to 150 tons; in such furnaces the resistance ribbon is inside the furnace and radiates heat directly on to the charge. The lecture was illustrated with lantern slides.

Changing Tungsten to Helium Gas.

An interesting experiment was described at the conference of the American Chemical Society at Chicago on Saturday, states the "Times" New York correspondent.

By exposing it to the temperature of 50 000 deg. F., Dr. Gerald Wendt and Mr. C. E. Iron, of the University of Chicago, succeeded in CHANGING TUNGSTEN TO HELIUM GAS. The feat of transmuting the metal in itself involved the generation of a temperature far exceeding anything hitherto achieved. To produce such a degree of heat the experimenters utilised an apparatus recently designed by Dr. C. P. Steinmetz for producing artificial lightning. It consists in charging an electrical condenser to 100 000 V and then suddenly releasing the charge.

Dr. Wendt and Mr. Iron, according to their report, discharged it into an extremely fine tungsten wire. It exploded with a deafening report, says Dr. Wendt, as if struck by lightning, producing a flash 200 times as bright as sunlight, with a momentary temperature of over 50 000 deg. After the flash he found atoms of tungsten decomposed into simpler ones, and the result was the change of metallic tungsten into gaseous helium. The experiment had its genesis in the fact, remarked by astronomers, that the number of materials composing the stars grows fewer as the temperature of the stars increases, till the hottest stars appear composed entirely of hydrogen and helium. Adopting the theory that this fact is due to the decomposition of other materials by the great heat, Dr. Wendt and Mr. Iron produced a temperature nearly equal to twice that of the hottest star, and found ordinary metals decomposed into simple gases, particularly helium.

Institute of Patentees.

At the second annual meeting of the INSTITUTE OF PATENTEES on Friday it was reported that there were 281 full members and 396 associate members. The technical committee had examined and reported on 245 inventions during the year. The Executive Committee found that a small proportion of the inventions submitted were really commercial propositions.

Mr. GODFREY CHEESMAN complained that too many British employers failed to give support to employees who made inventions. A man of brain and initiative was an asset to employers worth encouraging. Mr. G. H. Skinner advocated an Imperial patent for the whole Empire.

At the annual dinner of the Institute in the evening, Sir HARRY FOSTER presided, and among others present were Sir William Grey-Wilson, Sir Charles Bright, Lord Morris, and Major the Hon. Hugh Fletcher Moulton. LORD MORRIS, who responded to the toast of "Our Guests," urged that the laws should be amended to protect inventors. In Italy, the United States and Germany inventors were honoured, but in Great Britain the inventor had a hard road to travel.

A Wireless Dinner.

A wireless reunion, inaugurating what it is hoped will become an annual event, was held at the Trocadero Restaurant, London, last Saturday, when ADMIRAL OF THE FLEET SIR HENRY JACKSON took the chair at A WIRELESS DINNER. The company, numbering about 150, was composed entirely of those who had served during the War as wireless officers of one of the Fighting Services, or in an equivalent capacity, and included a large number of senior officers of the Services, the General Post Office, and the leading scientific and commercial interests.

After honouring the toast of "The King," the chairman proposed the health of Mr. Marconi in an interesting and reminiscent speech, outlining the growth of the youngest of the practical sciences from its very small beginnings to its establishment as the greatest medium for a system of world communications.

Mr. MARCONI, in reply, referred in moving terms to his early association with Admiral of the Fleet Sir Henry Jackson (or Capt. Jackson as he then was), who had passed from the *rôle* of Inspecting Officer to that of active collaborator, and to whose enthusiastic support the early adoption of wireless by the British Admiralty was largely due. He also paid a glowing tribute, based on personal inspection over various War fronts, to the efficiency of the British wireless organisation during the Great War, and to the skill and devotion displayed both by land and sea.

The Chairman, in complimenting the Organising Committee responsible for the arrangements, proposed the health of its Chairman, Colonel L. F. Blandy.

Colonel BLANDY, in reply, explained the origin of the idea of holding a reunion, and proposed that a Wireless Dinner Club should be formed, and an annual dinner arranged on the lines of the present dinner. He proposed that, in the first instance, qualification for membership should be the same as that which guided the committee in arranging the dinner this year, *i.e.*, that membership of the club should be confined to those who had done wireless work during the War as officers or in an equivalent capacity.

The proposal was welcomed, and everyone present at the dinner joined the newly-inaugurated Wireless Dinner Club, Admiral of the Fleet Sir Henry Jackson kindly consenting to be the first president.

Electric Lorries for Calcutta.

The question of refuse disposal in CALCUTTA has been for some time a source of trouble to the Corporation. There is a municipal railway for carrying the refuse out of the town, but some months ago the Corporation began experimenting with motor wagons for refuse removal. According to the "Municipal Journal," petrol-driven vehicles were introduced at first, but more recently the electrically-propelled lorry has been tried. At present there are ten petrol lorries and two electrics in service, each type having the same carying capacity, viz., 3½ tons. The provision of additional vehicles has recently been under consideration, and in connection with the proposal a report has been submitted in which it is pointed out that, excluding interest and depreciation, the running cost of an electric lorry is only about half that of a petrol lorry. In Bombay, where electric vehicles are employed, there has been very little trouble with batteries. The Calcutta Corporation has therefore decided to obtain tenders for eight more electric lorries, and to make provision for the cost in next year's estimates. By having the same number of each type of vehicle it is hoped to be able to obtain reliable figures of the relative working costs.

The British Industries Fair, Birmingham.

The BRITISH INDUSTRIES FAIR (Birmingham Section), which closed on Friday, was visited by 40 000 persons, including overseas buyers from all parts of the world. This is considered satisfactory, as the general public was not admitted this year. Mr. H. O. Worrall (the chairman of the council of the Fair) reported at the close that the amount of business transacted and the prospective business was more than last year, and that in regard to overseas trade especially there had been a notable increase. The improvement in business was specially marked in the small tool section, and satisfactory reports had been received in regard to hollow ware (aluminium of superior makes), electrical goods, general ironmongery and hardware. Mr. Worrall added that he was sufficiently optimistic to believe that the next few months would see a profound change in the position of British trade. Many exhibitors had booked stands for next year's Fair, and in some instances the space had been increased.

The Southampton Dispute.

After negotiations lasting over the week-end, the Parliamentary Committee of the SOUTHAMPTON Corporation recommended that the matter in dispute with the staff of the electricity works should be referred to the National Joint Board, and that the Corporation should agree to abide by the decision of the Board. On this understanding the E.P.E.A. and the E.T.U., the organisations representing the technical staff of the electricity undertaking, agreed temporarily to withdraw their notices, reserving themselves the right once more to present them should the Corporation fail to confirm the recommendation of their Parliamentary Committee.

We learn, however, that the proposed cut of 20 per cent. in salaries has now been withdrawn

Hull and Hessle Tram Extension.

A PUBLIC ENQUIRY was held last week at Hull by the Ministry of Transport into the application of Hull Corporation for a Light Railways Order to extend the electric tramway from the Pickering Park extension to Hessle. Mr. Alan D. Erskine was the presiding Commissioner, and with him were Mr. M. Kissane and Mr. Kenneth J. M. Teasdale.

Mr. W. B. CLODE appeared for the Corporation, and said there was considerable opposition, including the North-Eastern Railway Company, Hessle Urban Council, and others. The proposed line would be one and a half miles long. At present Hessle was served by the North-Eastern Railway and two motor-'bus proprietors, but they contended that passengers were not adequately served. A better service could be given without involving any charge upon the rates. It was not until city boundary extension was mentioned that opposition appeared. Mr. Bell claimed compensation for "injury and damage by competition," but Mr. Bell did not run his 'bus until application was made for the Order. Mr. McMaster's objection was based upon the assumption that a fixed tramway track was obsolete.

Mr. F. W. BRICKNELL, Hull City Engineer, thought there would soon be need for both trams and 'buses, and he described as ridiculous the suggestion that the trams would restore the congestion that formerly existed at Hessle.

Mr. E. S. RAYNER, manager and engineer of Hull Corporation tramway undertaking, said the running of a tramway to Hessle was a very sound financial proposition. A volume of traffic would be served which was not served by the railway. The capital cost would be £30 000, and he estimated that they would have to carry one million passengers per annum at an average fare of 2d. to make the undertaking pay.

The Hon. EVAN CHARTERIS, K.C. (for the North-Eastern Railway Company) said if the scheme was intended to be supplementary to the existing service, he submitted that it would be redundant and superfluous. If, on the other hand, the scheme was intended to substitute existing services, it raised an extremely serious question from a public point of view. It was proposed that the tramcars should do the journey in half an hour, but the railway journey only took ten minutes. The North-Eastern Railway paid one-tenth of the whole rates of the city. If, therefore, the application succeeded, the company would suffer by a depletion of traffic; if the scheme were carried out, and it became a loss, they would suffer as ratepayers.

Mr. F. G. THOMAS, K.C. (for Hessle Urban Council), said the local authority were unanimously of opinion that the tramway extension was not needed. Evidence was called to show that the public were satisfied with the 'buses.

The result will be announced in due course.

Telephone Overcharges.

In their report on the REGISTRATION OF TELEPHONE CALLS the London Telephone and Telegraph Advisory Committee state that a large number of communications have been received complaining of overcharges. This might be expected of a system under which each call is separately charged. The Committee cite eleven examples of a discrepancy between the number of calls noted by the Post Office and by private record. In one case there was difference in favour of the subscriber of 3 273 calls, and in another of 1 132. Up to the present the pure message rate has not been universally adopted. Conferences with officials of the Post Office have taken place with regard to the questions involved.

Besides directing attention to overcharges and to the need for establishing a satisfactory basis for adjusting differences, the Committee also raised other points of administration, such as the method of calculating the 5 per cent. reduction (2 000 calls or over) where a single subscriber had more than one line; the arbitrary manner in which demands are made for payment where charges are in dispute, &c. The Committee visited, by invitation, the Central Exchange in order to see the system in operation, and some particulars are given of what was observed. Every effort appears to be made to render the service as expeditious as possible and to improve organisation and installation. The meters are of a pattern used in the United States of America and elsewhere, and, though they may occasionally get out of order, they can scarcely be held responsible for the discrepancies. Stringent instructions are given to operators and great care is given to the question of correct registration. The Committee think that sufficient use is not made of the Department's slip entitled "How to avoid the risk of Overcharges." It was also pointed out that the Telephone Department undertake, if required, to train operators for subscribers and to send officers to advise with regard to the best methods of private registration, &c. The Committee, while satisfied that the Department is anxious to do everything to ensure accuracy, recommend that the Department be urged to continued efforts at improvement; but they also feel that some of those employed by subscribers to record calls lack technical knowledge and experience.

The "Mechanical World" ELECTRICAL POCKET BOOK, 1922, which is published by Emmott & Co. at 2s., hardly requires any introduction to our readers. There is now a lengthy section on power station construction and operation, while the section on switch gear and switchboards has been rewritten and extended so as to cover the latest developments in this important branch of the subject. A further example of modernity is the new section on electric hoists. The book is of a convenient size, and the type and illustrations are pleasingly clear.

E

Parliamentary Intelligence.

Wireless Receiving Apparatus.

In reply to Mr. HURD, who asked the Postmaster-General (House of Commons, March 7) if he were aware that the number of wireless telephone receiving sets in the United States had increased in one year from 50 000 to 600 000, and the entire country had been plotted into circuits with a central station so that every rural and urban home might obtain, at a cost below that of an ordinary gramophone, weather forecasts and business information as to prices and market conditions, as well as records of sermons, lectures, and entertainments; and whether he would endeavour to provide comparable facilities under the Post Office monopoly in this country, Mr. KELLAWAY said that he was aware that there had been a considerable increase in the number of private wireless installations in the United States. He understood, however, that, in consequence of the danger of interference with Government and commercial communications, the United States Government were considering the restriction of the use of wireless telephone for other purposes. Permission to use wireless receiving apparatus for experimental purposes was granted with comparative freedom in this country, the number of installations authorised being at present 7 500. The provision of facilities for broadcasting messages by wireless was under consideration.

Montevideo Tramways.

In reply to Colonel NEWMAN (House of Commons, March 7), Mr. HARMSWORTH said a strike for increased wages had stopped the working of the tramways of Montevideo for three weeks. The company was unable to pay the increased wages demanded by the men unless permission were granted to them by the Government to raise their tariff. A Bill to authorise this increase was for some time before Congress, but was not passed. It would come up again at the meeting of Congress on March 15. On Jan. 28 the Municipality assumed control of the tramway company. The British manager was invited to remain at his post, and the Municipality appointed an "interventor" to control gross receipts. Two accounts were now to be opened. One would provide for payment by the company of wages on the old scale, the other for the increased wages which the men demanded. These were to be paid by the Municipality from the company's gross receipts. The company had protested, and it was understood that they were now taking legal action against the Municipality. Uruguay was a member of the League of Nations.

Miners' Safety Lamps.

The Secretary for Mines (Mr. BRIDGEMAN), replying to Major KELLY in the House of Commons on Monday, stated that no fresh regulations governing the use underground of safety lamps were contemplated at the moment. He was awaiting recommendations in the matter from the Miners' Lamps Committee. As regards danger from choke-damp, he was advised that flame safety lamps or open lights (where used) gave sufficient warning to enable the miner to withdraw in safety. The electric safety lamp, however, could give no warning of the presence of inflammable or noxious gases, and the question what steps should be taken to provide safeguards in the general use of electric lamps by the workmen in a mine was now under consideration by the Miners' Lamps Committee.

Artificer Apprentices.

Replying to Mr. R. YOUNG in the House of Commons on March 8, Mr. AMERY stated that the details of the new scheme for training officers for engineering and electrical duties had not yet been approved, and no artificer apprentices, therefore, had so far been sent to Keyham, but when the scheme came into operation, probably in September next, it was the intention that a few artificer apprentices who showed sufficient promise (not exceeding one or two a year) should be chosen to undergo the course of training under the same conditions as the other officers.

Underground Railway Extension.

In the House of Commons on Monday, Mr. HILTON YOUNG, in reply to Mr. GILBERT, said the Treasury, on the recommendation of the Trade Facilities Advisory Committee, had agreed to guarantee a loan to be raised by the London Underground Railways for the purpose of extending and improving their Tube railways. Full details had not yet been completed, but he hoped to make a complete announcement very shortly.

Wireless at the Institution.

Those proceeding across Waterloo Bridge northward have a good view of the roof of the Institution, and the more observant have recently noticed the ERECTION OF A WIRELESS MAST, leading them to suppose that the Institution is celebrating its return to its own building by making arrangements for the reception of wireless messages. These suspicions are confirmed by the notification we have received that a permanent wireless aerial has now been installed for reception purposes. The details of this equipment are as follows:—

Span between strain insulators, 113 ft.; down lead from aerial to leading insulators outside, 63 ft.; down lead from leading-in insulator to floor of lecture theatre, 44 ft.; making a total down lead of 107 ft. The effective length of the aerial (down lead plus half the span) is, therefore, 163·5 ft., giving a natural wave length of approximately 200 metres.

Legal Intelligence.

Scottish Machinery Assessment Appeals.

An important judgment has been delivered by the Valuation Appeal Court (Lords Salvesen, Cullen and Hunter) in a series of appeals by fourteen firms of iron and steel makers in Lanarkshire against decisions of the Valuation Committees of the Middle and Lower Wards of the county. The Assessor undertook a revaluation of all the steel and iron works in the county, and the parties were at issue with the Assessor as to whether the contractors' principle should have been applied to certain plant and machinery, and as to whether the Assessor was entitled to apply that method in arriving at the annual value of the works as a whole. The appellants contended that the annual values for 1919-20 represented full valuations, and that the Assessor had failed to adduce any evidence to justify the increases he had made. The committees approved of the method adopted by the Assessor, but were of opinion that the percentages suggested were rather high. They were of opinion that, having regard to the whole circumstances, a reasonable abatement would be 30 per cent.; and the Court affirmed the decision of the committees.

In giving judgment, Lord Salvesen said the questions raised were of unusual importance, but he had no difficulty in rejecting the Assessor's contention that a building was not a building which was not enclosed by walls as well as by a roof. His Lordship also found it impossible to accept the Assessor's view that certain machinery was attached to the heritage, and he overruled the Assessor's objection to the exclusion from the heritable subjects of the rails laid across certain transverse walls in the foundations of one of the buildings for supporting bars of steel while undergoing cooling and also the plain floor plates and sleeper floors.

His Lordship said the Assessor had raised certain questions which turned upon the meaning of "first motive power." The first related to electricity, which was generated by means of steam-driven machinery. It was not disputed that steam-driven machinery was rateable, as well as the boilers. But the Assessor claimed that the dynamos actuated by the steam-driven machinery should also be included as heritable, apparently on the ground that the electric current so produced was used to operate machines in appellants' works. In his Lordship's view, the Assessor's view was negatived by the Guardbridge Paper Company case of last year, where their Lordships held that the boilers, the steam engines and the main shafting all fell within the definition of plant or machinery for producing or transmitting first motive power, but that when that power was transmitted by secondary shafting to the manufacturing machines it ceased to be first motive power. His Lordship thought this view governed the other matters raised by the Assessor.

Dealing with the main subject of the appeal, his Lordship took one case (the Dalzell Steel & Iron Works) in which the yearly rent or value was £105 236, against £27 000 in 1919-20. The result was undoubtedly startling, and appellants were right in their contention that there was a heavy onus upon the Assessor to justify so revolutionary a change. After an exhaustive analysis of the facts, their Lordships decided that the 30 per cent. abatement allowed by the committees should stand, though Lord Salvesen was of opinion that the allowance should have been 50 per cent.

The Lodge Tuned Wireless Patent.

The Royal Commission on Awards to Inventors continued on Monday last the hearing of the claims of Marconi's Wireless Telegraph Company and the Lodge-Muirhead Wireless and General Telegraphy Syndicate for an award in respect of the infringement by the Admiralty of Sir Oliver Lodge's Patent No. 11 575 of 1897.

Mr. C. F. Wilkins (director and manager of Muirhead & Company) and Mr. J. S. Vincent Pletts (consulting engineer to Marconi's Wireless Telegraph Company) gave evidence, the former dealing with the prices of and the royalties on apparatus supplied by the Lodge Muirhead Syndicate, and the latter with specific sets supplied to the Admiralty, and for which, it was stated, the Admiralty had paid or agreed to pay at rates corresponding to those now claimed.

The Attorney-General (Sir Ernest Pollock, K.C.) opened the case for the Admiralty, and said if the Marconi agreement with the Admiralty were cleared of its other liabilities, one arrived at a figure of £11 per kW for the whole period from 1903 to 1911. Taking the wattage of the whole of the sets, they had to deal with a figure of 6 846 kW-years, and by dividing that into £75 000, the result was £11 per kW per annum. Those who made that agreement, taking a just estimate of the very important user that would be made, were prepared to accept that sum. But when they came to the period of the war, it was said they were entitled to make those enormous claims on the Crown. It was true that a patentee had a statutory right to claim compensation from the Crown, as he could in the case of private persons, but the Crown was given the right, as against him, that he could not stop by injunction the use of the invention by the Crown, provided compensation were paid.

The Chairman said the Commission had already given it as their opinion, in their report, that the Crown, having availed itself of the statutory licence, compensation should be such as would be given in the case of a willing licensor and licensee.

The Attorney-General said that the Commission would be ready to disregard the Marconi Company's table, in which the selling price of £805 per kW had been arrived at by selling to foreign Governments, which he did not think had any possibility of providing themselves with the necessary sets. Nearly all the relevant figures in the company's tables had been made use of for enhancing the proposed royalty. In one item (No. 1 003) the price was given as £300, but it had to be admitted that where there were a large number of sales the price was £165.

The Attorney-General had not concluded his speech when the Commission adjourned until Monday next.

Hamilton v. Marconi's Wireless Telegraph Company.

In this case plaintiff appealed to the Court of Appeal (Lords Justices Bankes, Warrington and Scrutton) on Monday and Tuesday against an order of the Lord Chief Justice staying all proceedings in the action.

Mr. Hamilton, who appeared in person in support of his appeal, said the Lord Chief Justice had refused to allow the action to be tried in his court before the jury were sworn.

Mr. Hogg, K.C. (for defendants), said that was on a preliminary objection. He (counsel) objected to the action being tried before the jury upon the ground that the action was to rescind the agreement of May, 1920, made between Mr. Hamilton and the defendant, and that that agreement had been the subject of an action in the Chancery Division, in which defendants had sued Mr. Hamilton to restrain him from referring to the agreement or certain other documents in breach of his covenant, and that there had been an undertaking given by Mr. Hamilton (who was then represented by Mr. Upjohn, K.C.) to the court under which Mr. Hamilton undertook that he would not refer to the contents of the agreement or publish it, or repeat any part of it to anybody. His (counsel's) objection was that as long as that undertaking stood it would be contempt of court to break it, and that Mr. Hamilton's right course must be to get rid of the undertaking before he sought to open an action in which he was attacking the agreement itself.

In the result their Lordships held the order of the Lord Chief Justice was too wide, and made an order staying the proceedings in the present action for one month to enable Mr. Hamilton to bring a fresh action in the Chancery Division, if he thought fit, for the purpose of getting relief from his undertaking and for rescission of the agreement. A special order as to costs was made.

Collision with Unlighted Tramcar.

At York County Court recently, Robt. Whitehead, a taxicab proprietor, was awarded £100 damages against York Corporation on account of a collision with a tramcar. Plaintiff's case was that on the night of Nov. 11 one of his drivers was going round a sharp curve into Holgate-road and crashed into a stationary tramcar without lights. The trolley pole had become detached, and the head had fallen, disconnecting the overhead wire and extinguishing all the car lights. It was submitted that the Corporation were liable through the negligence of their servants in not taking steps to ensure the safety of people lawfully using the highway.

For the defence it was argued that if plaintiff's servant was driving so fast that he could not pull up it was not fair to mulct the Corporation in damages. Not ten seconds had elapsed before the car was plunged in darkness and the collision, and the Corporation's servants had not had time to do anything.

His Honour (Judge McCarthy) said the first duty of defendants' servants was to go to the corner and warn the traffic. He accepted plaintiff's story that there was time. He thought defendants were liable, and gave judgment for plaintiff accordingly.

Miller v. Lanarkshire Tramways Company.

Sheriff Shennan has awarded £60 to William Miller, miner, as damages for injuries sustained through being knocked down by one of defendants' tramcars. Miller, who was marching with a band, was struck from behind and knocked down. His Lordship found negligence by the tramway driver in trying to pass the band at the wrong moment.

Trade Improving.

The pessimism which has been expressed on the publication of the export and import figures for February seems a little unjustified, for though, compared with January, both imports and exports have declined, it must be remembered that February is the shortest month in the year, and this year had two working days less than January. This difference largely discounts the reduction recorded, even when the continual fall of prices is taken into consideration. This fall in prices is an important factor in any comparison that is made with the figures of the corresponding month last year, and to make such comparison except on the basis of quantities is altogether misleading. On this latter basis the figures are, in certain respect, very satisfactory. The export of coal has risen from 1 729 148 tons in February last year to 4 014 334 tons in February of this year. Iron and steel scrap has risen from 289 tons to 4 754 tons, a figure in excess of that obtained in February, 1920, when the boom was still in being. The export of copper is slightly in excess of that of the corresponding month of last year, though it is below the figure reached in February, 1920. Machinery, on the other hand, is still slightly below that of February, 1921, the figures being 34 884 tons as compared with 41 917 tons. In the staple industries, in which electrical engineers are not directly interested, but which are indirectly of great importance to them, far greater consignments of their products were sent abroad last month than in 1921. The outlook therefore gives rise to no pessimism, and if labour troubles could be composed the development should be correspondingly satisfactory during the coming months.

Electricity Supply.

Blackpool Electricity Works are expected to realise a surplus of £10 000 on the current year's working.

The Galway electricity plant has been destroyed by fire, damage to the extent of £15 000 having been caused.

Mr. J. H. Clothier, electrical engineer to St. Anne's Council, reports that during January the department connected fifty-six new lighting and thirty-four power consumers.

Teignmouth Urban Council have accepted the offer of the newly-formed Electric Lighting Company for public lighting for five years, at £4 per 100 c.p. lamp per annum and £6 per 250 c.p. lamp.

Waterloo-with-Seaforth Council are pressing Liverpool Corporation for the same terms for the supply of electricity as they are charging in Liverpool, Bootle, and other districts within the extended area of supply.

Mr. T. McLeod, the Sheriff, has been appointed chairman of the newly appointed Electricity Committee of Hull Corporation. Mr. Pearlman, who took a prominent part in the impeachment of the old committee, has accepted the position of deputy-chairman.

It is reported that there is every likelihood of an amalgamation between the Wirral Railway and the London and North-Western Railway. According to the "Liverpool Courier," the scheme for electrification proposed by the Wirral Railway in 1900, when they were empowered to raise £300 000 for the purpose, will very possibly follow the taking over of the line by L. and N.W. Railway.

Burnley Paper Works Company have applied to the Corporation for a supply of electricity. Special terms have been quoted for 300 h.p. during a 24-hours' day, and the engineer will lay the mains should these be accepted. A revised supply agreement has been made with J. Hargreaves, Ltd., of Bank Hall Colliery. The price per unit has been increased from 0·8d. to 1·02d., and a coal clause has been inserted in the agreement.

Belfast Ministry of Commerce has appointed the following to be Electricity Commissioners for Northern Ireland under the Electricity (Supply) Acts, 1882 to 1919:—Mr. Cecil Litchfield (chairman), permanent secretary, Ministry of Commerce; Mr. Walter Abbott; Mr. G. H. Edmiston Parr. Mr. F. W. Parkinson has been appointed electricity consultant and adviser to the Commissioners and the Ministry of Commerce.

The deputation from Glasgow Corporation, which recently visited London for the purpose of inspecting the lighting arrangements, has issued its report. After describing the methods employed in the City of London, it is pointed out that little or nothing has been done in the way of improvement on the system adopted in 1914, though that was good. In the City of Westminster experiments are made with gasfilled electric lamps in refractor bowls, but their method of use did not give the best results from the appliances installed. In many of the smaller London boroughs experiments are also being made with gasfilled lamps for public lighting. In Glasgow nearly 500 miles of streets have to be dealt with. Liverpool approximates to the position at Glasgow so far as street lighting is concerned, but it has no stair lighting, and the stair lighting forms a big part of Glasgow's lighting responsibilities. The deputation note with satisfaction that Glasgow lighting, taken as a whole, is equal to any lighting seen in the United Kingdom, except some of the main London thoroughfares, where the traffic is heavy.

New Schemes and Mains Extensions.

The scheme to supply Mumbles with electricity has been deferred for three months.

Warrington Corporation has received sanction to borrow the money required for the erection of a sub-station at Latchford Without.

Southport electrical engineer (Mr. E. Moxon) has been authorised to alter the supply to two local companies from single-phase to three-phase. An additional transformer is to be obtained from the Brush Electrical Engineering Company at a cost of £360.

Torquay Corporation are seeking leave to introduce a Bill for powers to acquire the Newton Abbot undertaking of the Urban Electric Supply Company, to extend the Corporation's area of electricity supply to Newton Abbot and the adjoining rural district, &c.

Accrington Town Council are about to supply the residents of Oswaldtwistle with current on terms 5 per cent. higher than the charges made in the borough to cover the additional cost incurred. Steps are now being taken to obtain the necessary statutory authority.

Alteration of Charges.

Fulham Council propose to reduce the charge for electricity from 7d. to 6d. per unit.

Walthamstow Urban Council have reduced the charge for electricity from 8d. to 7½d. per unit.

Hampstead Borough Council are reducing the price of electricity to private consumers from 8d. to 7d. per unit.

Canterbury Town Council have reduced the charge for current for power by ½d. per unit, as from April 1 next.

Electricity charges at Long Eaton have been reduced from 8d. to 7d. for lighting and from 3d. to 2½d. for power.

The price of electricity at Hebden Bridge is to be reduced by 1d. per unit for power and ½d. per unit for lighting.

Stockport Town Council have increased the minimum charge to consumers of electricity to £2 10s. per annum.

Tonbridge Urban Council have reduced the price of electricity for lighting by 1d. per unit for six months from April.

The price of electricity for lighting in Plymouth is to be reduced by a halfpenny a unit from the March meter readings.

Leicester Electricity Committee recommend a reduction in the charge for power from 133⅓ per cent. to 100 per cent. over pre-war rates.

Heywood Corporation have reduced the charges for lighting from 70 to 50 per cent. and for power from 80 to 60 per cent. above pre-war rates.

Sheffield Town Council have agreed to make a standard charge of 2d. per unit for all buildings and institutions in the city supported by the rates.

Lynn Town Council have agreed, as from the March meter readings, to reduce by ½d. per unit the charges for lighting and to cancel the last increase of 5 per cent. made to power consumers.

As from April 1, the charges for electricity at Weymouth will be reduced as follows:—Lighting, from 10d. to 9d., with discount; power, from 3½d. to 3d., with discount; public lighting, from 5·3d. to 4·9d.

Hammersmith Borough Council have made a reduction in the charges for electricity for lighting and power from the March meter readings. In future a minimum yearly charge of £1 per consumer will be made.

Poplar Council Electricity Committee recommend that from the meter readings in March the present charges for electricity of 85 per cent. above pre-war rates for power and public lighting and 70 per cent. for private and domestic supplies be reduced to an all-round charge of 50 per cent. above pre-war rates.

Sunderland Corporation have reduced its charges for electricity by 18⅓ per cent. to h.t. and 11½ per cent. to certain l.t. consumers, and by 5½ per cent. to the tramways. The chairman of the Electricity Committee has given an undertaking to consider a reduction to ordinary domestic consumers after the end of the financial year.

Glasgow Electricity Committee have decided to reduce the charges for electricity as follows:—Lighting: maximum demand from 6d. to 5d. and from 2d. to 1½d. for rebate rate. Domestic consumers, churches and schools: from 5½d. to 4½d. Power: maximum demand from 2¾d. to 2¼d., and for rebate rate from 1¾d. to 1½d. and from 1½d. to 1¼d. These reductions vary from 17 per cent. to 25 per cent. on present rates, and will amount to £217 000. They will take effect as from the May meter readings.

As from the March meter readings the following charges for electricity at Stepney will become effective:—(*a*) The secondary charges for lighting purposes under scales A, C and F, and the charge under scale G, to be 1½d. per unit; (*b*) the charge for power and heating under scale B to be 1½d. per unit; (*c*) the charges for electricity supplied and meter rent for lighting to be 33⅓ per cent., instead of 50 per cent. above pre-war charges; and (*d*) for power, heating, and private bulk supplies 25 per cent. instead of 50 per cent.

Dublin Electricity Committee recommend the following alterations in the electricity charges, as for the March meter readings:—(a) Abolition of the 10 per cent. addition to accounts, where in force; (b) reduction of the fixed rates (for theatres and other special consumers) by approximately 1d. per unit; (c) reduction of the special charges for large consumers by approximately 10 per cent., this being in addition to the 10 per cent. already mentioned; (d) increase of the allowance for combined lighting and heating from ¼d. to ½d. per unit; (e) the fixing of the maximum price at 9d. for all general consumers. With regard to power charges, there will be a reduction of ¼d. per unit in almost all cases, and the Committee also recommend substantial reductions in the meter rents, &c. The reductions represent a decrease in total revenue of £30 000 for the twelve months, apart from a reduction in street lighting of £3 000.

Institution Notes.

At a meeting of the West of Scotland and Ayrshire branches of the Association of Mining Electrical Engineers, held in Glasgow, on Saturday, a paper on the Clyde Valley Electrical Power Company's system was read by Mr. A. E. M'Coll.

A meeting of the Electrical Society of Glasgow will be held in Reid's Tea Rooms, 34, Gordon-street, Glasgow, on Tuesday next, at 7.30 p.m., when a Paper on "Organisation" will be read by Mr. Percy J. Sims, manager for Scotland, General Electric Company.

A special general meeting of the members and associates of the Institution of Electrical Engineers will be held at the Institution Building, Savoy-place, London, on the 23rd inst., at 5.45 p.m., for the purpose of passing formal resolutions authorising the Council to borrow from the Alliance Assurance Company the sums of £16 340 and £7 500 by way of mortgages on the Institution Building at Savoy-place and on the freehold and leasehold property of the Institution in Tothill-street, Westminster, respectively, in substitution for the present mortgages to the company, upon which the same amount is now due. Subsequently a further meeting confined to corporate members will be held to consider and adopt bye-laws for the Chartered Institution.

Electric Traction.

For the nine months ended Dec. 31 there was a loss of £17 000 on the East Ham Municipal Tramways.

The Beach Committee of Bournemouth Corporation again recommend the provision of two electric runabouts, as they would be cheaper and more convenient than petrol vehicles on the front.

The petition of Wandsworth Borough Council against the Bill promoted by the L.C.C. to introduce trackless trolley 'buses at Lewisham was disallowed by the Court of Referees at the House of Commons last week.

The net amount taken on the St. Anne's tramways for the year to the end of January last was £45 666, against £47 481 for the previous year. A sum of £24 581 was paid to Blackpool Corporation in respect of the service in their borough.

At the International Railway Congress, which is to be opened in Rome on April 18, under the presidency of M. Tondelier, of the Belgian State Railways, a large number of subjects relating to the improvement and development of railways will be discussed. The work of the Congress will be divided into five sections. Section II. includes electric traction, and in Section V. various aspects of light railway working will be dealt with. Various excursions have been arranged, and on Saturday, April 22, the delegates will visit the steel, hydro-electric, and carbide of calcium works at Terni.

A deficiency of £18 000 on the L.C.C. Tramways account was carried to the accounts for 1920-21, but counsel has advised that the Council had no power to raise in the rates levied in the year moneys to meet an estimated future deficiency on tramways. The district auditor, supported by the Minister of Health, maintained that the deficiency should have been transferred forthwith to the special county account, and it has, therefore, been decided to adopt this course, but the Highways Committee remain of opinion that their former practice was, from the point of view of accountancy, correct.

The Joint Industrial Council for the Tramways Industry decided last week to revise the 1919 agreement. Under the new arrangement, which will take effect from the first full pay period after April 17, the average duty schedule will be forty-eight hours for a week of six days. No schedule will be less than forty-four hours, nor more than fifty-two. On the question of spread-overs, each authority is to deal with the matter in conference with the local representatives of the trade union. With regard to "spare men," when a man is called out he is to be paid for a minimum of four hours for the first call and two hours for each succeeding call in the day. Holidays have been fixed at eight days annually, with pay, after twelve months' continuous service, Christmas Day to be worked when required, and double ordinary week-day rates paid for time actually worked. The new overtime rates are time and a quarter for the first two hours, and time and a half afterwards. The agreement will be terminable upon three months' notice from either side.

Personal and Appointments.

Capt. F. H. Masters, O.B.E., T.D., has been gazetted Major in the Territorial Army Reserve.

Dover Town Council has appointed Mr. D. Powell junior charge engineer at the electricity works.

Sir Arthur Whitten Brown (who made the memorable Atlantic flight) has been appointed consulting engineer to the Instone Air Line.

A new lectureship in the Faculty of Engineering in the utilisation of water power has been instituted at University College, London, and Mr. Theodore Stevens has been appointed.

Mr. F. R. Anderton has been elected Chairman of the London County Council for the ensuing year. Mr. H. C. Gooch is vice-chairman, and Miss Nettie Adler deputy-chairman of the Council.

Business Items, &c.

As from the 20th inst. the address of Holder-Harriden, Ltd. will be Noble House, 35-37, Noble-street, London, E.C. 2.

From to-day (Friday) the address of the Enterprise Manufacturing Company will be Electric House, Grape-street, Shaftesbury-avenue, London, W.C. 2. Telephone: Gerrard 3 018 and 3 019.

In connection with the liquidation of the Wilson-Wolf Engineering Company, Pooley & Austin announce that under the reconstruction scheme they have been re-appointed the sole London agents for the new firm, and will continue to supply fractional horse-power motors from stock in London or direct from the works as hitherto. They hope to have the complete original programme, which embraces all sizes for both a.c. and d.c. from 1-30 h.p. up to ½ h.p., in production within the next few months.

The Spearing Boiler Company, Ltd., and Tinkers, Ltd., Daisyfield Boiler Works, Hyde, near Manchester, have come to an arrangement under which the Spearing Boiler Company acquire the controlling interest in Messrs. Tinker's. The Spearing water-tube boiler will in future be made at the works of Tinkers, Ltd., where it is proposed to carry out large extensions to cope with the rapidly growing demand for the boiler. Mr. Spearing will join the board of Tinker's, Ltd., as chairman, and Mr. Frank Tinker will continue to act as managing director.

Narrandera (N.S.W.) Council have taken over the electricity works from Wise Brothers, who have supplied electricity in the town under a contract for the last seven years.

Telegraph and Wireless Notes.

The director of the Military Wireless Service has informed the Academy of Science that the transmitting energy of the Eiffel Tower Wireless Station will shortly be made much more powerful.

During the violent gales which swept over Southern England and the English Channel on Tuesday night and Wednesday last week wireless was the only method of communication with the Continent, and was not interrupted. The steamboat and air services were suspended, and telegraph and telephone communications were reduced to very small dimensions.

In connection with the proposal of the President of the United States to issue regulations regarding amateur wireless telegraphy, General Squiers, head of the Army Communications, states that within a few hours he had received formal protests from the Governments of Australia and New Zealand against the activities of a Californian amateur, who, in broadcasting the dulcet notes of a concert held in Santa Catalina, had brought the official communications of these Governments to a standstill for many hours.

Plans for the distribution of all the ex-German cables have been presented to the Ambassadors of Great Britain, France, Italy, and Japan by Mr. Fletcher, the U.S.A. Secretary of State, in his capacity as chairman of the International Conference upon Communications. The proposal has not yet been made public, and it is understood that its acceptance depends largely upon the attitude of France, as apparently it is acceptable to the other members of the Conference. It is understood that Italy will be allotted the Liberia-Brazil cable, and will be allowed a sufficient cash grant to lay a branch line connecting it up with Genoa. Japan is not taking part in the discussions, as she will accept any agreed division of the cables.

Obituary.

The death is announced of Mr. Percy Foulds, who was in business as an electrical engineer and contractor, at Heaton Moor, Stockport.

The death has occurred, at Port Glasgow, at the age of 73, of Mr. Matthew Blackwood, one of the pioneers in West Scotland of X-ray and electrical treatment. Mr. Blackwood was the founder, and latterly principal partner, of Blackwood and Co., saw millers.

We regret to announce the death of Dr. Augustus D. Waller, F.R.S., M.D., Director of the Physiological Laboratory, University of London. Deceased, who was a great authority on electro-physiology, was the inventor of an electro-cardiograph. He conducted many researches, and he was the author of several publications on physiology. Dr. Waller was born in Paris, and was 68 years of age.

The death is announced, at the age of fifty-two, of Mr. J. J. Walklate, General Controller and Town Clerk of Auckland, New Zealand. He went out to New Zealand to take charge of the City of Auckland Electric Tramways, Ltd., a concern that was later absorbed by the City of Auckland Corporation. Mr. Walklate was associated with the early development of electric street traction, having been engaged under Mr. Alfred Dickinson, of London and Birmingham, in the construction of the Darlaston and Walsall Tramway, claimed to be the first overhead electric tramway in this country. Later he was resident engineer for the Douglas and Laxey Electric Tramway, the Kidderminster and District Tramways, and the Potteries Electric Traction Company. He was a Staffordshire man.

Standard Starters.

At the last meeting of the Institution of Electrical Engineers valuable Papers on "Motor Starters" were read, and the opportunity was taken by Mr. C. H. Wordingham to present for discussion six draft British standard specifications for motor starters. These were submitted to members for criticism, and some useful points were raised. It was decided to adjourn the discussion of the specifications until Thursday, March 23. It is hoped that as many as possible of those interested in the manufacture, use and export of motor starters will make a point of attending and giving their views on these specifications in order to assist the committee to complete them on a satisfactory basis for all concerned.

German Engineers in Australia.

The Chief Victorian Electricity Commissioner (Sir John Monash) has issued a statement regarding the refusal of the Australian Federal Government to permit German experts to enter Australia and supervise the erection of the coal briquetting plant, which has been ordered from a firm at Halle (Germany), at a cost of about £100 000, for the Morwell Coalfield. The Electricity Commission have satisfied themselves that the undertaking cannot be launched without such guidance, in the absence of which there would be danger to the workmen and the plant. Sir John Monash adds that it is high time the public of Australia realised that the growth of native industries depends far more upon the acquisition from abroad of expert and scientific knowledge and experience than upon tariffs.

Since the above statement was issued, the Commonwealth Government has given permission for six German engineers to enter Australia and supervise the erection of the plant, as proposed by the Commissioners.

The annual meeting of the Batti-Wallah's Society will take place on Monday, March 20, at 2.30 p.m., at the Holborn Restaurant, and will be preceded by the abandoned (revived?) monthly lunch at one o'clock.

Companies' Meetings, Reports, &c.

County of London Electric.

After dealing with the report and accounts (Electrician, March 10) at the annual meeting of the County of London Electric Supply Company on Tuesday, Sir Harry Renwick (chairman and managing director), who presided, speaking of the general progress of the company, said that the units sold during the year were 51 220 079, an increase of 1 666 856 over 1920. The applications received for new business amounted to the equivalent of an additional 6 098 kW. The company was now rapidly approaching a total of 100 000 kW, and the total number of consumers supplied directly or indirectly was now well over 43 000. A further stage had been reached regarding the proposed station at Barking, the Commissioners having at last issued their draft consent for the company to proceed with the work. Their new Act had materially strengthened the company's position, and would be of great assistance in raising of funds and in disposing of certain difficulties in carrying out the actual works at Barking. Referring to the Electricity Bill, the chairman said there was much in it that was useful, and should assist in the development of the electric supply industry, particularly in the provinces. The clauses dealing with finance would no doubt be the subject of much discussion and, possibly, amendment. The clause dealing with the erection of railway generating stations would, however, give rise to direct opposition, and certainly as the clause stood drastic amendments were needed. The clause, so far as it permitted the erection of separate generating stations, was obviously an anomaly in a Bill the principal aim of which was centralisation and pooling of supplies. He was confident that the Government and the Electricity Commissioners realised the great work that private enterprise had performed hitherto in developing electricity supply, and that recent events had taught them that the wheels of trade could only be set going, and the industries of the country developed, by encouraging private enterprise. The Electricity Commissioners were admittedly rendering a great service to the community. The task they had entered upon of reorganising the electricity supply of the country presented enormous difficulties, and all who had the real interests of the industry at heart would give Sir John Snell and his colleagues their most loyal support. He, the chairman, had taken a personal interest in the Trade Facilities Act, and had been actively engaged in securing for electric supply companies participation in the benefits and advantages given under that Act. At the present moment the Advisory Committee had before them applications for assistance from electric supply companies to the extent of several millions, and some of those applications put forward by himself on behalf of the provincial undertakings had already been granted.

Telegraph Construction and Maintenance.

In the course of his speech at the annual meeting of the Telegraph Construction and Maintenance Company last week, Mr. Colin F. Campbell, who presided (in the absence of the chairman, who is in Africa), said that the heavy fall in the price of raw materials which had taken place in 1920 had continued in a lesser degree throughout 1921, but none of the raw materials with which they were most concerned had yet reached the pre-war figures. It might be argued that this fall was all to their advantage, which in a sense was true, but in a company such as theirs considerable stocks had always to be maintained, with the consequence that if prices continued to fall from one level to another, confidence in the stability of prices was apt to be shaken. They were fortunate last year in being able to keep their works and ships fairly well occupied, and they had little doubt that when trade revived they should be able to secure a fair share of the business to be done. Turning to the report and balance-sheet, the Chairman said the net profit was £120 880, an increase of £10 693 on 1920. The capital was still at £896 400. Debts owing by the company and reserves for insurance and contingencies (£1 528 331) were lower by £354 220 than last year. The reserve fund was £160 000, and it was being built up at the rate of £20 000 a year. The balance at credit of the profit and loss (£213 858) was £11 241 better than last year. On the other side of the balance-sheet, property, including stocks, amounted to £1 149 208. This was £402 770 down, mostly the result of the fall in prices of materials, which still continued.

The company's output of submarine cable was less than in 1920, due to the coal strike, which for some time restricted supplies of wire, and their turnover was also down, both from the same cause and from the general fall in prices. The good result of the year's working was due to appreciation of investments. During the war and since, every year had shown a fall in the value of the company's securities, averaging about £50 000 a year, which had to be allowed for before arriving at their net profits. That absorbed all the dividends or interest on the investments, and in some years considerably more. The beginning of 1921 seemed to have been the low-water mark with gilt-edged securities, and by Dec. 31 last there was a general rise, which had helped very much with this year's accounts. Out of the profit of £120 880 they proposed to pay £89 640 in dividends, adding £20 000 to reserve and £10 000 to the pension fund, which would leave £1 240 to increase the carry forward.

Underground Electric Railways.

Presiding at the annual meeting of the Underground Electric Railways Company of London last week, Lord Ashfield (the chairman of the company) said that the year 1921 had been a successful one for the operating companies, especially if compared with those which preceded it, and in particular with 1920. The present year would show a substantial fall in expenditure, as within the last few months there had been a decided drop in various items. Tyres had dropped 23 per cent., coal 41 per cent., and petrol 10 per cent. If expenditure was falling, so also was the traffic. The first seven weeks of 1921, compared with the same period of last year, showed that passengers had fallen by about 4 650 000 and traffic receipts by about £189 000. The fall of nearly 10 per cent. in receipts was explained by the continuing depression in trade and industry, by the lowering of the fares on omnibuses and tramways, and by the widespread lack of money to spend upon anything but the necessities of livelihood. Referring to the proposals made on behalf of the London Electric and the City and South London Railways to the Advisory Committee under the Trade Facilities Act of last year, Lord Ashfield said these proposals aimed at securing from the Government a guarantee as to principal and interest upon a capital sum not exceeding £5 000 000, which was to be expended upon the reconstruction to a larger size and re-equipment of the City and South London line, the construction of connecting lines at Camden Town with the Hampstead section of the London Electric Railway, and the extension of the latter railway from Golders Green to Edgware. He could not disclose the terms, as they were still under discussion, but he assured the shareholders that, taken over the series of years to be covered by the proposals, they should not be disadvantageous to the railway companies. The problem, which rested with the boards of the companies to decide, was whether the possible additional cost of the works carried out at once was offset by the reduced interest cost of the capital attributable to the Government guarantee, for the final cost to the companies was a combination of these two factors. There was no question that the works themselves were essential parts of a complete scheme of traffic facilities for London and were much overdue.

Mersey Railway.

Addressing the shareholders at the annual meeting of the Mersey Railway Company, Mr. James Falconer (the chairman) said that it was a special satisfaction to the board to be able to report that the company had at last reached the stage of being able to pay in full the interest on all its debenture stocks. The debenture holders would, he hoped, recognise that the board, so far as the debentures were concerned, had carried out the programme laid down in 1900, when it was resolved to adopt electric traction, and the scheme of arrangement was entered into. On the other hand, the shareholders must recognise the sacrifices made by the holders of the contingent debentures in reducing the interest upon their stocks and making its payment contingent upon the profits of each separate year, without which the scheme could not have been carried out. The result now reached had been arrived at by a continuous process of development, accomplished in the face of many difficulties. The development began in 1903 with the adoption of electric traction, and was maintained down to 1913, when they were within sight of being able to pay their interests in full. In 1902 the surplus of receipts over working costs was only £3 715. In 1913 the corresponding figure was £58 345, an increase of £54 630. In 1914 came the war and Government control, and the financial progress of the company was arrested for seven years. The installation of automatic signalling was now completed, and had been in operation for several months. It had proved itself to be of importance in increasing the capacity of the train service and maintaining its punctuality, and the company was advised that it provided an additional safeguard against the risk of accidents. Continuing, the Chairman said he thought they had placed the company upon its feet financially, and had established what had been authoritatively described as a world's record for the benefits to be derived from electrical working. The accounts of the company were dealt with in our issue of March 3.

British Mannesmann Tube.

Presiding at the annual meeting of the British Mannesmann Tube Company last week, Mr. R. S. Guinness, the deputy-chairman, said that the offer made by Baldwins, Ltd., to their shareholders had been accepted to the extent of upwards of 91 per cent. of the issued capital, but the reconstituted board had only been in charge of operations for a small part of the year under review. The stocks had been written down heavily to bring them into line with market values at June 30, 1921. An adverse balance on profit and loss account would have resulted, but the amount they were able to bring to the credit of revenue through the adjustment of excess profits duty had counteracted the abnormal depreciation of stocks. In their profits there was a decrease of some £95 000, due largely to the heavy depreciation he had referred to. During the first half of the year operations had been very successful, but in the second half the company had suffered very much from depression in trade, with the consequent cutting of selling prices. They had, however, been able to keep their works in operation, although output showed a considerable falling away. The board were doing everything possible to bring down expenses and so reduce the cost of production. Orders, however, were both scarce and keenly competed for, and it was difficult to see any signs of encouragement at present. The whole question with regard to writing off allowances on capital expenditure had been finally arranged with the Inland Revenue.

Charing Cross, West End and City Electricity Supply.

Addressing the shareholders at the annual meeting of the Charing Cross, West End and City Electricity Supply Company last week, Mr. W. F. Fladgate (chairman of the company), said that against the difficulties of the last year it was satisfactory to record that on the combined undertakings there had been an addition of over 90 000 lamps connected and an increase in sales of over half a million units, and the cost of generation had been materially reduced since the delivery of the new plant.

After dealing with the accounts, an abstract of which we gave in our last issue, the Chairman referred to the corporation tax. He said that up to the present the company, being a public utility company, was exempt from this tax, but after December it became operative upon them. Having regard to the fact that they were subject to a fixed rate of charge, it appeared extremely unfair that electricity companies should be saddled with the tax, and they were taking joint steps to endeavour to get a further exemption.

Harrow Electric Light and Power.

Mr. J. N. Stuart presided at the annual meeting of the Harrow Electric Light and Power Company. The balance to the credit of the net revenue account, including the sum of £662 brought forward from 1920, and after deducting debenture interest and the interim dividend on the preference shares, was £3 674, which the directors recommended should be dealt with as follows: in payment of the final dividend on the preference shares, £375; in payment of a dividend on the ordinary shares at the rate of 7 per cent. per annum, £2 333, leaving a balance to be carried forward of £965. The chairman said there had been an addition of about 200 new consumers during the year, a record number, and an increase in the sales of electricity of 87 000 units above the last or any previous year, while the revenue had increased £3 180 above that of 1920. The gross profit was £9 530, against £7 765, or 8½ per cent. on the capital expenditure. During the year they had substituted for the old steam-driven plant three rotary converters, driven off the bulk supply obtained from the North Metropolitan Company. The new plant purchased cost £7 500, but this had been met out of the sums put aside for depreciation in previous years, to which £5 000 was added during the current year. A further generating set was on order, to be in readiness for next winter's load, and the heavy work of strengthening their mains was continuing to be carried out. During the past few months there had been a few short interruptions of the supply, due to old bitumen cables laid many years ago breaking down. The company had for some time past been gradually replacing these cables with new paper-insulated and steel-armoured cable, which had proved to be more durable in Harrow soil.

London and Suburban Traction.

In moving the adoption of the report and accounts at the annual meeting of the London and Suburban Traction Company last week, Lord Ashfield, who presided, said that the directors were able to recommend a dividend on the five per cent. cumulative preference shares for the first time since 1917 at the rate of 3½ per cent. in respect of arrears, being the balance of 2½ per cent. for 1917 and 1 per cent. on account of 1918. This improved position of the company was due to the increased net earnings of the tramway and omnibus companies in which they were interested. The traffic receipts of the tramways increased from £1 566 000 in 1920 to £1 722 000 in 1921. The operating expenses were only slightly higher, with the result that the operating balance of the three companies was £350 000, compared with £214 000. The passengers carried were 190 000 000 in 1921, being nearly 17 000 000 less than in the previous year. This falling off was largely due to the general trade depression and the prolonged coal strike. The fact that, notwithstanding the fall in traffic, the net earnings showed a substantial improvement was attributable to the increase in fares which took place in 1920, and the considerable economies which had been effected in general working. The decrease in wages which took place towards the latter part of the year, the introduction of labour-saving and power-saving devices, and generally improved methods of working had not only counteracted the loss in traffic, but had increased the net income of the companies.

Oxford Electric.

Presiding over the meeting of the Oxford Electric Company on Friday, the chairman (Sir Henry Mance) congratulated the shareholders on the company's increased revenue. They were maintaining the dividend at 5 per cent. and placing £3 000 to reserve, against £2 000 last year. The long-continued coal strike cost the company, one way and another, £4 000 to £5 000. Up to the present no steps had been taken to form an electrical area in their part of England. They occupied an isolated position, and he did not think there was any probability of their being approached by the Electricity Commissioners for a considerable time, but any suggestions made to them in the future would receive the directors' careful consideration. If the Commissioners should desire, in the course of a few years, to supply them with electricity at a cheaper rate than the company could generate it themselves, they would naturally wish to become their customers, but if this were not to be they would have to take timely precautions to provide themselves with generating plant to meet the increasing demand. He took it that the company would always remain the distributing agency, and so, as the demand increased, they would have to go on extending their mains.

Electrical Distribution of Yorkshire.

Presiding at the annual meeting of the Electrical Distribution of Yorkshire (Ltd.) last week, the chairman, Mr. R. W. Wickham, said that during the year over £40 000 had been expended in capital extensions, and in order to cover their commitments to bankers, and to provide for further extensions, it was proposed to issue about 50 000 shares of £1 each, being the balance of the authorised nominal capital, and, as they had close business relations with the Yorkshire Electric Power Company, it was proposed to extend the privilege of taking an interest in the distribution company to shareholders of the power company. This was the tenth year in succession for which a dividend of 6 per cent., free of tax, had been paid. The increase in the rate of income tax had, in effect, meant an increase in the rate of dividends, but the board had carefully reviewed the position established by the company, and intended, unless the unexpected happened, to recommend a higher rate of dividend next year. An abstract of the accounts was given in The Electrician of March 3.

The American Telephone & Telegraph Company announce a quarterly dividend of 2¼ dollars.

The Mirrless Watson Company recommend a dividend of 10 per cent. and a bonus of 2½ per cent., less tax.

The Shawinigan Water & Power Company have declared a dividend of 1¾ per cent. for the quarter ending March 31.

The directors of Stothert & Pitt announce an interim dividend of 1s. per share, tax free, on the ordinary shares.

The Midland Electric Corporation for Power Distribution announce a dividend of 6 per cent., making 10 per cent. for the year 1921.

The Mississippi River Power Company have declared a dividend of 1½ per cent. on the preferred stock, payable to holders of stock on the 17th inst.

A meeting of the Argentine Tramways & Power Company is to be held on the 22nd inst. to consider a scheme for the reorganisation of the capital of the company.

The Brazilian Traction, Light and Power Company have declared a quarterly dividend of 1½ per cent. on the cumulative preference shares to holders of record on March 15.

The Manilla Electric Corporation announce a quarterly dividend of 1½ per cent. ($1.50 per share) on the common stock, payable in New York to stockholders of record on the 20th inst.

The directors of the Direct Spanish Telegraph Company recommend dividends for 1921 of 10 per cent. on the preference shares, less tax, and 10 per cent. on the ordinary shares, tax free.

Uxbridge and District Electric Supply Company recommend a dividend of 8 per cent. on the ordinary shares for the year, against 4 per cent. last year. The sum of £10 000 is placed to depreciation and £393 carried forward.

The following companies will be struck off the Register of Joint Stock Companies unless cause to the contrary is shown before June 10:—Bright's Light & Power, Drycells, Electric Floor Machine Company, London & Provincial Electric Company.

British Insulated and Helsby Cables announce a further dividend on the ordinary shares of 6¼ per cent. and a bonus of 5 per cent., making 15 per cent for 1921. The sum of £35 000 has been placed to reserve for depreciation, leaving £362 000 to be carried forward.

The National Trust Company, 18, King-street East, Toronto, as trustee for the 5 per cent. first mortgage thirty-year gold bonds of the Electrical Development of Ontario, is prepared to receive up to April 11 offers for the sale of the bonds to an extent to absorb $78 205.

The report for 1921 of the Commonwealth Edison Company shows gross income of $9 527 330, less deductions $1 326 503, leaving $8 200 827. Interest on funded debt amounted to $2 834 042, leaving $5 366 785. Dividends paid absorbed $4 307 126, leaving $1 059 659 to be carried forward.

The accounts of the Mackay Companies for the year to Feb. 1st show income from investments $4309 252. Dividends paid absorbed $4 180 340. Operating expenses, including Federal income-tax, transfer agents, salaries, etc., amounted to $82 771, leaving $46 141 to be carried forward.

The net profit for 1921 of the Guernsey Railway, after allowing for depreciation, renewals, income-tax, and various other charges, was £2 255. After providing for the preference dividend, the directors recommend a dividend of 7½ on the ordinary shares, leaving £602 to be carried forward.

The directors of the Canadian General Electric Company, in Toronto, have declared a quarterly dividend on the common stock of 2 per cent. for the three months ending the 31st inst., being at the rate of 8 per cent. per annum, and a dividend on the preference stock of 3½ per cent. for the six months ending the 31st inst., being at the rate of 7 per cent. per annum.

Thos. W. Ward have decided not to pay an interim dividend on the ordinary shares for the half-year ended December. The directors state that various matters affecting taxation accounts remain to be settled, and having regard to the depression in trade they consider this course to be in the best interests of the company. Quarterly dividends at the rate of 5 per cent. per annum on first and second preference and employees' shares will be paid on the 31st inst.

The directors of Stewarts & Lloyds, after setting aside £70 000 for depreciation and providing for income and corporation taxes, recommend, subject to audit, dividends for the half-year on the 6 per cent. preference shares and 10 per cent. preferred ordinary shares, both less tax, on the deferred shares (fully paid) 2s., and a bonus of 6d. per share for the year, both free of tax, and on the deferred shares, fully paid from Sept. 30, 1921, 1s. 6d. and bonus of 4½d., both free of tax. The sum of £230 000 has been placed to reserve, £10 000 to employees' benefit reserve, leaving £180 000 to be carried forward.

The accounts of Davis & Timmins for 1921 show a loss of £12 850, due to depreciation in the value of stock. A claim for repayment of excess profits duty in regard to this depreciation has been made to the Inland Revenue authorities, but no amount in respect of the claim has been taken credit for in the present accounts. The balance

brought in was £53 535. Deducting loss, interim dividend on preference shares and on ordinary shares at 6 per cent. per annum for the half-year to June 30, and after placing £15 585 to income tax account in respect of 1920, there remains £21 891. The directors propose to pay a balance dividend at 10 per cent. per annum on the ordinary shares for the half-year to Dec. 31, making 8 per cent. for the year, free of tax, carrying forward, subject to taxation, £17 741.

The net profit of FERGUSON PAILIN for the year ended Nov. 30 was £19 638, making, with £7 937 brought in, £27 575. The directors recommend a further dividend of 4½ per cent. on the preference shares, making 7 per cent. for the year, and a further dividend of 9½ per cent. on the ordinary shares, making 13 per cent. for the year. The sum of £2 000 has been placed to reserve and £15 264 carried forward, subject to excess profits duty for two years to Nov. 30, 1920, and corporation tax for two years to Nov. 30, 1921.

The accounts of BRUCE, PEEBLES AND CO. for 1921 show a profit, including balance brought in, of £119 616. The sum of £82 221 has been placed to reserve, leaving £37 395 to be carried forward. The directors recommend a dividend of 7½ per cent. per annum on the preference shares for the half-year to December 31st, less tax, with a further dividend of 2½ per cent. for the year, less tax, making the full dividend of 10 per cent., and a dividend on the ordinary shares for the year of 10 per cent., plus bonus of 5 per cent., less tax, leaving £7 919 to be carried forward.

Negotiations are taking place for the sale of the TORONTO POWER COMPANY to the Hydro-Electric Power Commission of Ontario. There has been competition between the company and the Commission. The shareholders of the Toronto Street Railway Company (who at present control the Power Company), realising the effect of the competition upon the company's revenues, have approved the proposed agreement. If the Power Company debenture-holders also acquiesce they will, in the event of the sale being completed, exchange their existing guarantee for that of the Commission, coupled with an unconditional guarantee from the Government of Ontario.

Electrical Imports and Exports.

IMPORTS.—The following are official values of electrical machinery, apparatus, and material imported into this country (*a*) during February, 1922, and (*b*) the aggregate figures from Jan. 1 to Feb. 28, with increase or decrease compared with corresponding periods of 1921 :—

Electrical machinery, (*a*) £198 163 (increase £134 101), (*b*) £245 034 (increase £69 971); telegraph and telephone cables, submarine, nil: other than submarine, (*a*) £2 600 (decrease £7 069), (*b*) £6 097) (decrease £19 423); telegraph and telephone apparatus, (*a*) £8 629 (decrease £17 248), (*b*) £25 824 (decrease £28 869); other electrical wires and cables, rubber insulated, (*a*) £3 566 (decrease £41), (*b*) £8 173 (increase £2 088); with other insulations, (*a*) £4 707 (decrease £5 560), (*b*) £8 240 (decrease £11 387); carbons, (*a*) £2 485 (decrease £7 833), (*b*) £5 133 (decrease £23 293); glow lamps, (*a*) £22 127 (increase £474), (*b*) £41 163 (decrease £209); arc lamps and electric searchlights, (*a*) nil (decrease £829), (*b*) nil (decrease £4 731); parts of arc lamps and searchlights (other than carbons), (*a*) £571 (decrease £3 032), (*b*) £1 138 (increase £2 623); batteries, (*a*) £3 365 (decrease £8 494), (*b*) £7 015 (decrease £22 608); electrical instruments, commercial and scientific, and electricity meters, (*a*) £4 810 (decrease £20 886), (*b*) £10 643 (decrease £31 382); switchboards, (*a*) £20 (decrease £932), (*b*) £965 decrease £205); other electrical goods and apparatus, (*a*) £36 561 (decrease £56 343), (*b*) £86 761 (decrease £116 084). Total of electrical machinery, apparatus, and material (other than uninsulated wire), (*a*) £287 605 (increase £6 308), (*b*) £446 186 (decrease £188 755).

EXPORTS.—The exports of electrical machinery, apparatus, and material (*a*) during February, 1922, and (*b*) from Jan. 1 to Feb. 28, with increase or decrease compared with corresponding periods of 1921, were as follows :—

Electrical machinery, (*a*) £384 015 (decrease £8 511), (*b*) £951 279 (increase £113 621); including railway and tramway motors, (*a*) £15 178 (increase £2 259), (*b*) £31 056 (decrease £15 250); other generators and motors, (*a*) £177 240 (decrease £58 393), (*b*) £521 739 (increase £42 709); and electrical machinery unenumerated, (*a*) £191 597 (increase £47 623), (*b*) £398 484 (increase £86 062); telegraph and telephone cables, submarine, (*a*) £61 084 (decrease £45 667), (*b*) £64 478 (decrease £135 772); other than submarine, (*a*) £34 234 (decrease £117 917), (*b*) £115 897 (decrease £233 736); telegraph and telephone apparatus, (*a*) £139 732 (decrease £10 971), (*b*) £360 803 (increase £68 247); other electrical wires and cables, rubber insulated, (*a*) £40 926 (decrease £102 854), (*b*) £97 046 (decrease £232 041); with other insulations, (*a*) £114 983 (decrease £60 432), (*b*) £238 949 (decrease £143 409); carbons, (*a*) £2 363 (decrease £9 788), (*b*) £9 106 (decrease £21 820); glow lamps, (*a*) £29 583 (decrease £16 192), (*b*) £58 593 (decrease £30 047); arc lamps and searchlights, (*a*) £141 (decrease £994), (*b*) £1 092 (decrease £1 338); parts of arc lamps and searchlights other than carbons), (*a*) £244 (decrease £1 042), (*b*) £781 (decrease £1 169); batteries, (*a*) £24 999 (decrease £48 951), (*b*) £58 593 (decrease £30 047); electrical instruments, commercial and scientific, and electricity meters, (*a*) £35 728 (increase £4 755), (*b*) £72 194 (decrease £7 900); swtichboards, (*a*) £24 389 (increase £14 883), (*b*) £110 364 (increase £78 450); other electrical goods and apparatus, (*a*) £100 356 (decrease £119 988), (*b*) £223 276 (decrease £245 627). Total of electrical machinery, material, and apparatus, other than uninsulated wire, (*a*) £992 778 (decrease £523 549), (*b*) £2 362 251 (decrease £894 106).

Tenders Invited and Accepted.

UNITED KINGDOM.

LONDONDERRY CORPORATION. March 14.—1 000 kW rotary converter equipment with switchgear, panels, &c. Specification from the City Electrical Engineer.

BELFAST GUARDIANS. March 21.—Wiring and fitting fever hospital. Specification from the Clerk at the Workhouse.

BRIGHTON GUARDIANS. March 21.—Electrical fittings. Particulars from the Clerk, Guardians' Office, Prince's-street.

PORTSMOUTH GUARDIANS. March 22.—Three months' supply of electrical fittings. Particulars from the Clerk, Mr. H. C. Morrell, Guardians' Offices, St. Michael's-road.

DUBLIN GUARDIANS. March 28.—Electric lift at Brook-street Infirmary. Specification from the Clerk, Brook-street, Kennington-road, London, S.E.

COMMISSIONERS OF H.M. WORKS, &c. April 12.—Electrical engineering labour-in-daywork in Leeds district.

EDINBURGH CORPORATION. April 15.—Converting plant for lighting and traction and d.c. switchgear for Portobello station. Specification, &c., from Sir A. B. W. Kennedy, 17, Victoria-street, Westminster, S.W. 1.

BATLEY CO-OPERATIVE SOCIETY.—Electric light installation. Specification from the Secretary.

SOUTH AFRICA.

DURBAN ELECTRICAL DEPARTMENT. Postponed from Jan. 18 to April 19.—*Supply of 372 consumers' W-hour meters, including 37 d.c. meters; 275 single-phase, 50-cycle, induction-type meters; and 60 three-phase, 50-cycle, induction-type a.c. meters for unbalanced loads.

MUNICIPAL COUNCIL OF JOHANNESBURG. April 12.—*Supply and delivery of six (or more) h.t. metal cubicles suitable for 3 000-3 300 V two phase, 50 cycles, 200 A normal working load, and for, alternatively, similar equipment for 500 A. (Contract 887.) Fifteen miles 0 000 S.W.G. (0·4 in. diameter) round section hard-drawn trolley wire of a conductivity not less than 98 per cent. Mathieson's standard on stout wooden drums, each containing half-mile of wire. The drums are to have a hole 3 in. in diameter through centre for mounting on bar for rolling off. Tenders are to be based on electrolytic copper at £69 per 2 240 lb.

WIMBLEDON Corporation have accepted the tender of the English Electric Company for h.t. switchgear for Raynes Park sub-station, £859 10s.

STOCKTON-ON-TEES Corporation have accepted the tender of British Insulated & Helsby Cables, Ltd., for e.h.t., l.t. and pilot cables, £2 968 14s.

BIRKENHEAD Corporation have accepted the tenders for the Pirelli General Cable Works for 4-core cable, £1 007 15s.; and the Macintosh Cable Company for single cable, £1 183 10s.

KENSINGTON (London) Borough Council have accepted the tender of Rawlings Bros. (lowest tender received) for wiring and fitting the Town Hall. Four tenders were received, the highest being £1 473 5s.

WALLASEY Corporation have accepted the tenders of United Water Softeners, Ltd., for water-treating plant for the electricity department, £1 368; and Metropolitan-Vickers Electrical Company for switchgear, £2 600 10s.

HAMMERSMITH Borough Council have accepted the tender of the Hackbridge Cable Company for 1 000yds. of 7/22 twin cable for the Wormholt Housing Estate at £88 10s. Eight tenders were received, the highest being £111.

TODMORDEN Corporation have accepted the tenders of General Electric Company for switchgear and cubicle, £555; New Switchgear Company for sheet steel cubicle, £191; and Brush Enginering Company for two transformers, £1 080 19s.

STEPNEY Borough Council have accepted the following tenders :—Maclennan & Company, for 1 000 rolls 1 in. white tape, at £97 10s. (three tenders were submitted, the highest being £113 15s.); W. T. Henley's Telegraph Works Company, for 500 gallons of resin oil, at £162 10s.; A. Reyrolle & Company, for meters, at £166.

BLACKPOOL Tramways Committee have accepted the tender of the General Electric Company for the supply of one 1 000 kW rotary converter, and that of the English Electric Company for two 300 kW rotary converters, as well as the tender of Higginbottom & Mannock for the supply of one 25-ton overhead electric travelling crane.

LEEDS Corporation have accepted the following tenders :—Tramways Supplies, Ltd., one mile of trolley wire; J. W. Hinchliffe, 45 H.P. motor; English Electric Company, ten partial electric equipments for tramcars; British Thomson-Houston Company & Ferguson, Pailin, Ltd., switchgear; F. W. Brackett & Company, circulating water screens, £1 020; Enfield Ediswan Cable Works, cables, £12 434; W. T. Henley's Telegraph Works Company, cables, £10 975.

MANCHESTER Corporation have accepted the following tenders :—Hall Bros., wiring Embden-street, Bangor-street, and Every-street schools; Bruce Peebles & Company, 1 500 kW motor converter; Ferguson, Pailin, Ltd., l.t. switchgear; British Insulated & Helsby Cables, Ltd., and Pirelli General Cable Works, Ltd., cable; Holt & Willett, one ton electric hoist for Barton power station; Metropolitan-Vickers Electrical Company, induction motor generator; J. V. Pyatt, wiring ninety houses.

---

* *Particulars from the Department of Overseas Trade.*

Foreign Notes.

An important electric power station has just been opened at Motala, in Central Sweden, with a capacity of 21 000 kW.

It is reported that the Uruguayan Government has received an offer from an Austrian bank to supply TRAMWAY ELECTRIFICATION MATERIAL IN EXCHANGE FOR WOOL.

In consequence of the prolonged drought in Northern Italy, which caused a shortage of hydro-electric power, many manufacturers are reported to be using brown coal for generating electricity.

A 5 000 c.p. light on a tower 75ft high has been installed at Cuatro Vientos Aerodrome, near Madrid. It will flash the Morse code for H T I when the arrival of aeroplanes by night is expected.

The business of the Cie. des Forge et Acieries Electriques Paul Girod has been amalgamated with that of the Société d'Electrochimie et d'Electrometallurgie, of Paris, and in consequence the capital of the latter company has been increased to 36 400 000 frs.

Interesting tests were recently carried out by the Southern Californian Edison Company in connection with the proposal to convert their two twenty-four-mile Big Creek transmission lines from 150 000 to 220 000V. Only about twenty-seven miles of line were tested, and although limited in duration, the "Electrical World" reports that the results of the tests show that only a relatively simple modification of the lines will be needed to meet the new conditions. The original insulation consisted of nine 10in. cap and pin suspension units, but it has been concluded that eleven units will be required at the higher voltage. In the experiments shield rings were installed at the bottom of all strings and 280 kV applied, and one flashover occurred under rainy conditions. As only one bank of high voltage transformers was available, it was not possible to transmit power, the lines being merely energised.

Owing to the cheap power available and the transport facilities available on the Rhine, both Alsace and Lorraine are becoming popular as industrial centres. Many French and foreign firms propose to erect new metallurgical and engineering works. The reorganisation of electricity supply is being carried out in all the districts, so that the surplus electrical energy of one may be utilised by the other. The Société Electrique de Sidérurgie Lorraine, with a capital of eight million francs, has been formed by the principal metallurgical companies. A 65 000 V transmission system will supply Mont St. Martin, Micheville, Algrange, the Moselle Valley above Thionville as far as the Orne Valley, Auboué, Landres, Réhon, Longwy and Mont. St. Martin. It will be connected with the State system along the north-eastern frontier and with the La Houve system, which is being constructed by the Société Alsacienne et Lorraine d'Electricité (Salec).

Catalogues, Price Lists, &c.

The A.C.E.C. (Atéliers de Constructions Electriques de Charleroi) have issued their March stock list of motors and dynamos.

An up-to-date price list giving particulars and illustrations of the "Helios" electric kettles and other table devices has just been published by the manufacturers, Wm. Soutter & Sons.

A new catalogue (List W3) of wireless apparatus for reception and transmission has been received from H W. Sullivan. The booklet, which consists of sixty-four pages, is well produced and fully illustrated.

Pamphlet F2 694, recently issued by the General Electric Company, contains details and illustrations of English alabaster bowls of various designs for semi-indirect lighting. This firm are also circulating Leaflet No. L2 715, giving revised prices of Wittom primary cells and parts appearing in L (2) section of their 1920 catalogue.

Apart from their large sale of miners' electric safety lamps and accumulators, Oldham & Son, Ltd., carry on an extensive business in accumulators for motor-bus and coach lighting, and their accumulators for this purpose have now been exclusively adopted by many of the most prominent motor vehicle builders and proprietors for starting, lighting and ignition purposes. Full particulars of the various types of accumulator manufactured by the firm are contained in an illustrated booklet (Price List No. 124) lately published.

A new and third British edition of the Michell Bearing Book has recently been brought out. The booklet was first published in 1916 for the purpose of explaining, in simple language, how the oil film in a bearing can be made to carry the highest possible load with the least frictional resistance. It is not a trade catalogue, but rather a short introduction to the modern science of lubrication, illustrated by practical examples. Supplements to this publication, dealing more specifically with particular applications of the principles described, can also be obtained on application to the firm.

The Record Electrical Company inform us that they are now manufacturing a complete series of Cirscale instruments, the standard sizes being 2¾in., 4in., 6in., 8in., and 16in. dials, and the scale length in each case more than twice the dial diameter. Apart from the increased scale length, the "Cirscale" is, they claim, in all respects superior to the usual bi-polar type, the magnetic system which is astatic rendering the instrument indispensable where strong magnetic fields are present, the error being less than 1-12 that of the ordinary moving coil instrument. The revised prices are only a little in excess of the ordinary moving coil type. The company have also developed a miniature Cirscale instrument for use in confined spaces, such as motor-cars, airships, submarines, &c.

COMMERCIAL INTELLIGENCE.

County Court Judgments.

[Note.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

COX ELECTRIC ENGINEERING COMPANY, 21, Third-avenue, Bordesley Green, electrical engineers. £14 11s. 6d. Jan. 12.

DE COSTER & COMPANY, LTD., registered office, 102, Boundary-lane, St. John's Wood, electrical engineers. £30 14s. 1d. Jan. 11.

MALLINSON, H. E., care of Ipswich Corporation, Ipswich, electrical engineer. £34 18s. 8d. Jan. 11.

NORVALL, G., & COMPANY, 242, Goswell-road, E.C., electrical engineers. £57 2s. 5d. Oct. 3.

STEEL, GEORGE, & COMPANY, Sprowston-road, Forest Gate, electrical engineers. £18 18s. 7d. Jan. 11.

TILLOTSON, Mr. S., 52, Kennington Park-road, S.E., electrical contractor. £22 16s. 5d. Jan. 13.

VENN BROTHERS, 39, Turnham Green-terrace, Chiswick, electrical engineers. £19 11s. 9d. Jan. 10.

Deed of Arrangement.

JOWETT, Charles Eric (trading as C. E. JOWETT & COMPANY), Lowther-arcade, Harrogate, electrical engineer. Filed March 10. Trustee, C. H. Baker, 1, Albion-street, Leeds. Liabilities unsecured, £750; assets, less secured claims, £294.

Mortgages and Charges on Limited Companies.

[Note.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

CORDOBA LIGHT, POWER & TRACTION COMPANY, LTD., London, E.C. Registered Feb. 25. Trust deed dated Feb. 10, 1922 (supplemental to trust deed registered March 13, 1909), securing £572 602 debenture stock, making with the sum of £427 398 debenture stock outstanding under trust deed registered March 13, 1909, £1 000 000; general charge (with special provisions in regard to certain shares held by company). *£429 500. Jan. 3, 1922.

HENDERSON & THORNTON, LTD., London, W.C., electrical apparatus dealers, &c. Registered March 4, £500 debentures; general charge.

INSULATING PRODUCTS, LTD., East Boldon. Registered Feb. 27, £8 000 debentures, to Branch Nominees, Ltd., 15, Bishopsgate, E.C.; general charge. *——. Jan. 2, 1922.

KEMP (H. S.) & COMPANY, LTD., London, W.C., electrical engineers. Registered March 2, £300 debentures, to Belco, Ltd., Windsor House, Kingsway, electrical engineers; general charge.

Satisfaction.

HEXHAM & DISTRICT ELECTRIC SUPPLY COMPANY, LTD. Satisfaction registered March 7, £10 000, registered Feb. 17, 1921.

Private Meetings.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

DUROLITE MANUFACTURING COMPANY, LTD. (in voluntary liquidation), Hardinge-lane, Penge. A meeting of creditors was held last week. The liquidator said that the liabilities to unsecured creditors amounted to £2 774, while there were partly-secured creditors for £891, the security held being valued at £25. The assets consisted of cash in hand £17, furniture £135, and there were 3 000 ordinary shares in a company called Clydo, Ltd., but it was uncertain what the shares would realise, and the liquidator said that it would be safe to assume for the time being that the assets were somewhere between £300 and £400. It was said that the Clydo Company had been run in conjunction with the Durolite Company, and the patents of the Clydo machines, which consisted of an illuminating sign, were believed

to be of very considerable value. In the result it was decided that the liquidation should be left in the hands of Mr. H. C. Merrett with a committee of inspection.

NOYES, STOCKWELL & COMPANY, LTD., Lennox House, Norfolk-street, Strand, London, W.C. A meeting of creditors held recently confirmed the voluntary liquidation of the company, with Mr. A. W. Heale as liquidator. Total liabilities were reported as £8 876, and net assets £647. The liabilities included £1 500 due to English trade creditors, while £4 125 was owing to the General Ordnance Company, Ltd., of New York. The bank were partly-secured creditors, as also were a guarantee corporation, who held tractors as part security. The company was formed in January, 1920, with a nominal capital of £5 000, and it took over certain concessions, which were paid for by the issue of shares. It was believed that the company had never been very successful, and latterly had traded at a heavy loss.

London Gazette.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

Company Winding-up Voluntarily.

PORTPATRICK ELECTRIC SUPPLY COMPANY (THE), LTD. James Purves appointed liquidator. Meeting of creditors at the Dunskey Estates Office, Portpatrick, on March 24, 1922, at 12 noon.

Bankruptcy Information.

HALLETT, Graham Moore, 7, King-st., Frome, co. Somerset, electrical engineer. Receiving order, March 7. Debtor's petition. First meeting, March 22, 12 noon, 26, Baldwin-street, Bristol. Public examination, March 28, 11.45 a.m., County Court Offices, Frome.

WILLIAMS, Aneurin Tudor, and BEVAN, William John, trading as the ELECTRICAL & GENERAL ENGINEERING COMPANY, 49, Commercial-street, Aberdare, electrical engineers. First meeting, March 22, 11.30 a.m., 34, Park-place, Cardiff. Public examination, April 21, 10.30 a.m., Temperance Hall, Aberdare.

Notices of Dividends.

WATKINSON, Matthew, WATKINSON, Harold, and WATKINSON, Arthur (trading as WATT & CO.), 22 and 24, Palmer-road, Sheffield, electrical and mechanical engineers. Amount per £, 6s. 2d., first and final. Payable, March 20, Parkin & Company, 36, Bank-street, Sheffield.

WORTHINGTON, Vincent Broughton, Ellesmere-yard, Walkden, co. Lancaster, electrical and mechanical engineer. Amount per £, 5¾d., first and final. Payable, March 20, Official Receiver's Offices, Byrom-street, Manchester.

Notices of Intended Dividends.

DAVIS, William Aaron, 14, Basinghall-street, Leeds, electrical engineer. Last day for receiving proofs, March 29. Trustee, H. C. Bowling, 24, Bond-street, Leeds.

OWEN, Joseph (trading as J. OWEN & SONS), 186, Westcombe-hill, and 3, The Grove, Greenwich, electrical engineer. Last day for receiving proofs, April 3. Trustee, Official Receiver, 29, Russell-square, W.C. 1.

RAWSTHORNE, Thomas, 67B, Paradise-street, West Bromwich, co. Stafford, electrical engineer. Last day for receiving proofs, March 25. Trustee, E. E. Deane, Ruskin Chambers, 191, Corporation-street Birmingham.

Application for Discharge.

KERSHAW, Arthur, and WOOD, Charles Herbert, carrying on business in partnership together at 9, Bradford-road, Dewsbury, under the style of KERSHAW & WOOD, electrical engineers, &c. Hearing, April 5, at 11 a.m., County Court House, Dewsbury.

Partnership Dissolved.

GOSLING, Albert Newland, and ARNALL, Jabez Christopher, electrical and mechanical engineers, 1, Thomas-street, Smethwick, co. Stafford, under the style of J. C. ARNALL & COMPANY, by mutual consent, as from March 8, 1922.

Bankruptcy Proceedings.

GOSS, Frederick Charles, 64, Gloucester-road, Bishopston, late 71, North-road, Bishopston, and 32, Windsor-road, St. Andrew's Park, Bishopston, electrical engineer. The receiving order in this matter was made on Feb. 28, on debtor's own petition. The statement of affairs shows liabilities of £1 291, while the net assets are estimated to realise £268, or a deficiency of £1 022. Debtor attributes his failure to slump in trade, depreciation in value of stock, expenses in connection with agency for automatic lighting plant, and expenses in connection with the illness of his wife. He commenced business in May, 1919, as an electrical engineer in partnership with another. In October, 1919, the partnership was dissolved, debtor taking over the assets and liabilities. Subsequently debtor traded on his own account, and for the first two years the business was fairly successful, but during the last year, by reason of the slump in trade and falling prices, he traded at a loss. On Feb. 8 a meeting of creditors was held, when it was resolved that efforts should be made to realise sufficient from the assets to provide a composition of 4s. in the £, but as the creditors were not unanimous, the petition was filed. Debtor became aware of his position in August last.

INCE, Arthur Courtenay (trading as the NEWCASTLE ELECTRICAL ENGINEERING COMPANY, formerly the TYNE ELECTRICAL INDUSTRIES, in co-partnership with another person), 21, Fenkle-street, Newcastle-on-Tyne, electrical contractor. At his public examination last week debtor stated that he was born in Barbados, West Indies, and came to England in July, 1915, to enlist. He was in the Army until November, 1919, and then had between £500 and £600. He commenced the Newcastle Electrical Engineering Company in October, 1920, with another man. In May, 1921, this man left the business, and on Aug. 16, 1921, debtor was joined by another man. At that time the business was in difficulties. The name was changed to the Tyne Electrical Industries, and debtor took over responsibility for the debts of the old firm. Debtor attributed his failure to bad trade and losses on trading. He stated further that he had very little experience of business in this country and had to depend upon others.

MAIDMENT, Percy Charles, builder and electrician, 13, Beauchamp-place, S.W. The first meeting of creditors under a receiving order made against this debtor was held at the London Bankruptcy Court before Mr. Vyvyan, Official Receiver. The debtor, in a preliminary examination, had stated that he began business as a builder and electrical engineer in partnership in 1916 at 164, Sloane-street, S.W. A few months later, owing to disagreements, the partnership was dissolved, the debtor paying his partner £4 250 and assuming the liabilities. To enable him to pay out his partner he borrowed £3 600 from bankers, £1 000 from his father, and £600 from a brother. He continued the business at a loss until March, 1921, and then sold it for £4 500, out of which he repaid his loans. He afterwards took premises at 13, Beauchamp-place, and started a similar business, which he carried on until Jan. 26, when the Sheriff took possession and sold his effects. The debtor, who said he had done a good business in electrical apparatus, attributed his failure to the general depression in trade. He estimated his liabilities at £1 658, against assets £157. The case was left with the Official Receiver for administration in bankruptcy.

PUGH, Herbert John (trading as H. J. PUGH & COMPANY), electrical engineer, 38, Broadway-parade, Crouch End, N. This debtor, who failed in December last, attended at the London Bankruptcy Court last week for public examination on a statement of affairs showing unsecured debts of £470 and no assets of value. Debtor said that he began business at 1, Hornsey-rise, in May, 1914, removing to 37, Broadway-parade, Crouch End, in the following November. He was joined soon afterwards by a partner, who retired in the middle of 1916, and he had since traded alone. He took additional premises at 38, Broadway-parade in October, 1917, and twelve months later gave up No. 37. In February, 1921, he took premises at 76, Fore-street, Edmonton, to which he transferred £100 of his stock, but the business there was unsuccessful, and two months later he closed it and disposed of the remaining stock from a stall in Club-row, E. His failure was due to bad trade and the stoppage of his business during the execution of repairs to the premises. The examination was concluded.

New Companies.

General Electro-Motives.

General Electro-Motives, Ltd. (180 239). Private company. Reg. March 10. Capital, £5,000 in £1 shares. To acquire the benefit of an agreement between Electromobile, Ltd., and J. A. Popplewell and F. E. Popplewell, and to carry on the business of electrical, mechanical, and general engineers, &c. Life directors: J. A. Popplewell and F. E. Popplewell. Registered office: 62, Hunslet-road, Leeds.

Olso-Light.

Olso-Light Company, Ltd. (180 211). Private company. Reg. March 9. Capital, £6 000 in £1 shares. Manufacturers, importers, and shippers of and dealers in merchandise, including electric lighting and heating requisites, &c. First directors: J. O'Malley-Davies (chairman and managing director) and C. B. Liddell. Registered office: 47, Victoria-street, S.W. 1.

Radio-Constructa, Ltd.

Radio-Constructa, Ltd. (180 126). Private company. Registered March 6. Capital, £500 in £1 shares. To adopt an agreement with G. H. Moody and to manufacture and deal in wireless telegraphic and telephonic apparatus and appliances and electrical apparatus and accessories, &c. First directors: H. D. Butler and G. H. Moody. Solicitor: W. I. Thomas, 32, Chancery-lane, W.C.

Unwin-Soar Agency.

Unwin-Soar Agency, Ltd. (180 191). Private company. Reg. March 8. Capital, £2 500 in £1 shares. Mechanical and electrical engineers, iron and steel workers, &c. Life directors: F. Unwin and M. Soar, Housley Park. Registered office: Orchard-chambers, Church-street, Sheffield.

Webb & Wilson.

Webb & Wilson, Ltd. (180 257). Private company. Reg. March 10. Capital, £1 000 in £1 shares. Constructional, mechanical, electrical, heating, lighting, and ventilating engineers and consultants, &c. First directors: G. L. Wilson and H. E. Webb. Secretary, G. F. Broadway. Registered office: 523, High-road, Tottenham, N. 17.

Growth of U.S. Industrial Power Load.

The rapid growth of the industrial power load in the United States is proved by some figures given in a recent issue of the "Electrical World." On Jan. 1, 1915, the number of stationary motors in use was 575 000, with a connected load of 6 100 000 h.p.; but by January, 1920, the figure for motors had doubled, and the load was 12 900 000 h.p. By January, 1925, it is anticipated that the load will be 20 800 000 h.p. The units sold indicate that only 34·5 per cent. was for lighting in 1915 and 28·4 in 1919, but the power figures (including the street railway load) were 51·1 and 57·2 per cent. respectively. The use of the electric steel furnace is also extending rapidly. In 1915 only forty-one steel works employed them, when only 62 000 tons of electric steel were produced. The capacity of the electric power plants installed in steel works was 25 000 kW and the electrical energy used was 45 000 000 units, but in 1919 there were 287 steel works, which produced 566 084 tons, the plants installed having a capacity of 240 000 kW and the electrical energy consumed was 260 000 000 units. In 1921 it is estimated that there were 336 steel works employing electric furnaces and the capacity of the generating plants was 320 000 kW.

Openings for Trade in the Netherlands.

The "Handelsbelangen" of Feb. 15 and 22 gives particulars of the following contracts for which tenders are likely to be invited in the near future:—The Limburgsche Groene Kruis (Rijksweg Z.Z. 7, Sittard) intend building a modern hospital on the road Sittard-Heerlen, with accommodation for 250 patients. Estimate, Gld.1 250 000. Building will probably begin this summer. The granting of the concession for the electrification and extension of the Gooische Stoomtram (director, F. M. Augustijn, Watergraafsmeer) may be expected this year. The line Amsterdam-Hilversum will be the first to be electrified, and a power station and annex buildings will be constructed. The Zeeuwsch Vlaamsche Tramweg Mij, of Axel (Z), intend to lay a new tramline, with stations, sheds, &c., in Zealand. The plans will probably be drawn up by Ingenieursburean W. E. Kramer and H. Polano, Noordeinde 18A, The Hague.

Electricity in Farming.

An interesting example of the use of electricity in farming is given in the "Industrial Australian." Mr. J. C. Fredericksen, of Rous Mill, Richmond River, N.S.W., has constructed a dam on a small creek near his farm, and has erected a Pelton water wheel, giving 17 h.p. with the water applied as at present through a 3-in. nozzle. This drives a d.c. dynamo of about 5 kW, which supplies current for lighting and for fans and radiators in five homes on the farm and in the dairies, &c., while it also supplies power to a 5 h.p. motor operating milking machine, separator, lathe, grindstone, chaff-cutting, corn-shelling and bushnut-shelling machines. A sawmill for heavy work is driven directly by the Pelton wheel, the electrical plant being temporarily disconnected. A novel feature of the electrical installation is that no battery is used, the speed of the generator being regulated by means of wires extending from the farm to the Pelton wheel, a quarter of a mile away, and attached to the valves controlling the water supply to the wheel.

Arrangements for the Week.

FRIDAY, March 17th (to-day).

Institution of Mechanical Engineers.

6 p.m. At Storey's Gate, London, S.W. Paper on "British and American Locomotive Design and Practice," by Mr. P. C. Dewhurst.

Institution of Electrical Engineers
London Students' Section.

7 p.m. At Savoy-place, London, W.C. Paper on "The Electron Theory," by Mr. C. C. H. Wade.

British Electrical Development Association.

7.30 p.m. At the Chartered Institute of Patent Agents, Staple Inn-buildings, London, W.C. Salesmanship Conference. No. 5, "Salesmanship in Relation to Showroom Displays and Demonstrations." Speaker: Mr. A. C. Bostel.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, London, S.W. Lecturette on "Power Factor Improvement," by Mr. G. H. Ayres.

SATURDAY, March 18th.

Royal Institution.

3 p.m. At Albemarle-street, London, W. Lecture on "Radio-activity," by Sir Ernest Rutherford, F.R.S. (Lecture III.)

MONDAY, March 20th.

Institution of Electrical Engineers.
(Liverpool Sub-Centre.)

7 p.m. At the University, Brownlow-street, Liverpool. Paper on "The Interconnection of A.C. Power Stations," by Messrs. L. J. Romero and J. B. Palmer.

Institution of Mechanical Engineers.
(Graduates' Section.)

7 p.m. At Storey's Gate, London, S.W. Paper on "Hydro-Electric Course at the University of Grenoble," by Capt. H. Whittaker.

Institution of Electrical Engineers.
Informal Meeting.

7 p.m. At Savoy-place, London, W.C. Discussion on "The Importance of Studying Finance in Connection with Electricity Undertakings," to be opened by Mr. A. Wright.

Institution of Civil Engineers.

7.30 p.m. At the Hotel Metropole, Leeds. Paper on "Modern Methods of Water Purification," by Mr. N. K. Holmes.

Royal Society of Arts.

8 p.m. At John-street, London, W.C. Lecture on "The Constituents of Essential Oils," by Mr. G. Radcliffe.

TUESDAY, March 21st.

Institution of Civil Engineers.

6 p.m. At Great George-street, London, S.W. Paper on "All-Electric Automatic Power Signalling on the Metropolitan Railway," by Mr. W. Willox.

Institution of Electrical Engineers.
North-Western Centre. Informal Meeting.

7 p.m. At the Engineers' Club, Manchester. Paper on "Specifications and Estimates," by Mr. J. Frith.

Röntgen Society.

8.15 p.m. At the Institution of Electrical Engineers, Savoy-place, London, W.C. Silvanus Thompson Memorial Lecture delivered by Sir Oliver J. Lodge, F.R.S.

WEDNESDAY, March 22nd.

Industrial League and Council.

7.30 p.m. At Caxton Hall, London, S.W. Lecture on "Some Common Fallacies on Trade and Industry," by the Right Hon. G. N. Barnes, C.H., M.P.

THURSDAY, March 23rd.

Electrical Power Engineers' Association.
Derby and District Section.

6.45 p.m. At the "Flying Horse" Hotel, Poultry, Nottingham. Paper on "Power Station Efficiency," by Mr. J. N. Waite.

National Liberal Club. Political and Economic Circle.

8 p.m. At Whitehall-place, London, S.W. Lecture on "Revolution by Consent," by Mr. J. A. Hobson.

FRIDAY, March 24th.

Electrical Power Engineers' Association.

7 p.m. At the Institution of Electrical Engineers, Savoy-place, London, W.C. Lecture on "Electric Control of Large Amounts of Power," by Dr. C. C. Garrard.

Edinburgh Electrical Society.

8 p.m. At the Philosophical Institute, 4, Queen-street, Edinburgh. Paper on "Magnets," by Mr. J. M'Ewan Brown.

Royal Institution.

9 p.m. At Albemarle-street, London, W. Discourse on "Auxiliary International Languages," by Prof. F. G. Donnan, F.R.S.

It is announced that Sir Evelyn Cecil, chairman of the Telephone Select Committee, has completed the draft of the report on the telephone service. Recommendations are to be made the effect of which, if adopted, would be to reduce expenditure on the service without impairing its efficiency. By this means it is believed that it will be possible to lower telephone rates by 10 per cent.

Patent Record.

SPECIFICATIONS PUBLISHED.

The following abstract from some of the specifications recently published have been specially compiled by Messrs. Mewburn, Ellis & Co., *Chartered Patent Agents, 70 and 72, Chancery-lane, London, W.C.*

Complete Specifications.

146 474 Cameron, W. J. Incandescent electric lamps. (14/2/16.)
146 520 Western Electric Co., Ltd. Telegraphic ciphering and deciphering mechanism. (13/9/18.)
146 529 Radio Corporation of America. Receivers of electrical oscillations. (18/6/14.)
146 881 Western Electric Co., Ltd. Wireless signalling apparatus. (1/12/15.)
147 428 Ges. für Drahtlöse Telegraphie. Arc transmitters for wireless telegraphy and telephony. (3/7/14.)
147 436 Ges. für Drahtlöse Telegraphie. Wireless transmitters. (6/12/13.)
147 610 Western Electric Co., Ltd. Telephone systems. (20/2/19.)
147 849 Ges. für Drahtlöse Telegraphie. Generation of electric oscillations. (29/9/17.)
148 221 Allgemeine Elektricitats Ges. Choking coil with variable inductance or transformer for doubling frequency. (10/7/14.)
149 330 Nolle, J. A. van der. Absorbents for use in galvanic batteries. (19/7/19.)
157 909 Kruger, F. High ohmic resistance. (27/11/19.)
169 285 Automatic Telephone Manufacturing Co. Ltd., Savin, J., & Mercer, R. (partly communicated by Automatic Electric Co.). Telephone systems. (23/6/20.)
169 295 Sanders, H. C. Electrical quick make-and-break switches. (26/6/20.)
169 297 British Thomson-Houston Co., Ltd. (General Electric Co.). Electrical regenerative control apparatus and systems. (28/6/20.)
169 305 Parsons, I. H., & Ball, A. E. J. Apparatus for the reception of electro-magnetic waves. (2/7/20.)
169 324 Wade, H. (Concordia Elektrizitats Akt.-Ges.). Portable electric hand lamps. (13/7/20.)
169 330 Della Veneria, Z. R. Electric switches. (16/7/20.)
169 340 Igranic Electric Co., Ltd. (Cutler-Hammer Manufacturing Co.). Electric switches. (21/7/20.)
169 359 Booker, H. Bromide electric printing boxes. (23/10/20.)
169 361 Silbermann, F. Electric letter-forming apparatus for advertising and the like. (10/8/20.)
169 377 Atkinson, C. L. Rotary electric distributors for internal combustion engines. (6/9/20.)
169 395 Armstrong, A. W. Sparking-plugs (2/11/20.)

APPLICATIONS FOR PATENTS

December 10, 1921.

33 198 Cockerill. Electrical flooder and tell-tale for carburettors of internal combustion engines.
33 218 Pollard. Boards for charging torch accumulators.
33 221 Large. Electric kettle, &c.
33 239 Magneta Time Co. & Webber. Intermittently operating electrically actuated devices.

December 12, 1921.

33 284 Waterhouse. Combination couplings for electric condensers.
33 288 Richards. Electrolytic rectifiers.
33 306 Oates. Commutators for generators and motors.
33 309 Latimer. Dimming electric hand lights for cars, &c.
33 349 French-Brewster. Driving means for electric mechanical pocket lamps.
33 353 Prince. Means for obtaining telephonic modulation of high frequency oscillations.
33 369 Cole. Interrupter for metal vapour apparatus ignited by h.t. impulses. (11/12/20. Austria.)
33 372 Johnston. Electric clocks.
33 386 Pfiffner. High tension condensers. (5/1/21, Germany.)

December 13, 1921.

33 419 Ellis. Aerials for wireless signalling.
33 420 Bosch (R.), Akt. Ges. Magneto-electric devices. (13/12/20, Germany.)
33 422 Hancock & Russell. Switches.
33 424 Collingham & Owen. Electric lighting plants for motor vehicles, &c.
33 434 Jacob. Device for locking lamps to sockets
33 435 Railing, Garrard, & McColl. Switches.
33 442 Hopkins. Electric resistances.
33 445 Paul. Numbering machine for telephone calls.
33 466 Della Riccia. Auto transformer. (14/12/20, Germany.)
33 470 Kahn. Automatic cut-outs or interrupters. (13/12/20, Germany.)
33 473 Chambers. Electro-magnetic wave receiving and amplifying systems.
33 476 Powell & Miles. Electric clocks, time recorders, &c.
33 490 Westinghouse Lamp Co. High Temperature electric furnaces. (13/12/20, U.S.)
33 533 Renaudin. Insulator for high pressure electric lines. (15/12/20, France.)
33 534 Hoffman Mfg. Co. & Barden. Electrical measuring of sounds or mechanical vibrations.
33 536 Reid. Cleaning plates of accumulators, &c.
33 549 Pollock. Thermionic valve relay.

December 14, 1921.

33 550 Onward. Valves for controlling supply of current to anode of valve of continuous wave transmitter.
33 551 Wheeler. Automatic metering of telephone calls.
33 556 Bosch (R.), Akt. Ges. Slip rings for generators. (20/12/20, Germany.)
33 559 Anderson & Huntsworth. Telephone call counting, registering, &c., apparatus.
33 561 Davies & Son (Derby) & Dawson. Means for unlocking magnetically locked lamps.
33 567 British United Shoe Machinery Co. Electric heating of tools of edge setting machines.
33 569 Mynne Model electric motor.
33 580 Hill. Connections for electric cables, &c.
33 591 Hanson Traction motors.
33 619 Darsey. Prevention of removal of lamps from sockets.
33 634 Hall. Coin collecting means for telephones.
33 635 Hall. Meter registers and control devices for telephones.
33 647 Westinghouse Electric & Mfg. Co. Motor-control systems. (14/12/20, U.S.)
33 648 Metropolitan-Vickers Electrical Co. Flexible couplings.
33 649 B. T.-H. Co. Incandescent lamps. (18/1/21, U.S.)
33 651 Marsollier. Electrical connecting devices and lampholders.
33 657 Metropolitan-Vickers Electrical Co. & Fletcher. Armatures of electrical machines.
33 663 Marshall. Electrical device for destroying rats.

December 15, 1921.

33 701 Electric Construction Co. & Close. Safety vents for electric motor cases, switch boxes, &c.
33 706 Williams. Marking conductors of multi-conductor cables, &c.
33 717 Amberton. Electric resistances.
33 744 Langdon-Davies & Soames. Bringing into and out of circuit an inductive resistance or choke.
33 747 ...er & McGregor. Electric drive for talking machines.
33 762 Planer. Localisation of faults in cables, &c. (3/12/21, Germany.)
33 779 Clark. Electric fuses.
33 785 Metropolitan-Vickers Electrical Co. Fusible devices for protecting electric circuits. (21/1/21, U.S.)
33 792 Morgan & Saynor. Electrical adapters, plugs, &c.
33 796 Thor Electric Lamp Co. & Jones. Electric lamps.
33 807 Pratley & Lovell. Electric couplings.
33 814 Laboratorio Elettratecnico Ing. L. Magrini. Electric control of distant installations. (28/2/21, Italy.)
33 819 Schaufelberger. Electric heater. (20/12/20, Switzerland.)
33 820 Barsby. Electric motor.

December 16, 1921.

33 852 Donnithorne. Production of h.t. unidirectional currents of electricity.
33 860 Cable Accessories Co., Reeves & Crawford. Electric fans.
33 879 Farrell. Automatic transmitter for wireless and land telegraphy, &c.
33 907 Sykes. Electro-magnetic apparatus for recording sound.
33 925 Best & Lloyd & Spittle. Electric light, &c., fittings.
33 927 Abel. Electric immersion liquid heaters.
33 928 Siemens-Schuckertwerke. Impregnating insulating bodies made in layers. (20/12/20, Germany.)
33 941 de Vries de Waal. Electric couplings.
33 966 Tennant. Wireless receiving apparatus.

December 17, 1921.

33 977 Whittaker Bros. (Accrington) & Duckworth. Electric wringers and Mangles.
34 023 Automatic Telephone Mfg. Co. & Gillings. Telephone systems.
34 024 Hacking. Electro-magnetic engines.
34 033 Stephens. Telephone receivers, &c.
34 041 Butler & Moody. Insulating stands and holders or plugs for holding coils, &c., for use in electrical apparatus.
34 054 Shuter & Smith. Coating electrical conductors.
34 057 Cranston & Le Bar. Electrolytic cells.

December 19, 1921.

34 060 Cummins & Poulton. Means for counting and recording number of telephone calls.
34 064 Wilkinson. Automatic electric circuit breakers.
34 083 Monson. Electro-magnetic manufacturing appliances.
34 087 Shearer. Magneto and self-starter.
34 098 Roberts & Willmot. Electric time-recording apparatus.
34 108 Croll. Electrical adapters and wall plugs.
34 125 Bartel & Happel. Apparatus for cooling and ventilating electric machines. (17/12/20, Germany.)
34 138 Akt. Ges. Brown, Boverie et Cie. Mercury vapour air pumps. (31/12/20, Switzerland.)
34 139 Rushen (Bing Weike). Toy wireless telegraphic or telephonic apparatus.
34 140 Brown. Wireless telegraphy.
34 142 Watts. Resistances, &c.
34 145 Claremont & Scholes. Electric joints.
34 149 Forde. Electric lugs.
34 156 King. Electric motors, dynamos, or generators.
34 166 B. T.-H. Co., Warren & Clough. Electric current collectors.
34 170 Soc. de l'Accumulateur Tudor. Storage batteries. (18/12/20, Belgium.)

December 20, 1921.

34 187 Griffiths. Electric filament lamp holders.
34 188 Crabtree. Switches.
34 193 Edwards. Portable electric apparatus for attachment to domestic baths.
34 205 Lovelace & Walster. Electrically operated indicators, &c.
34 206 Colman & Lees. Supporting clip for cables, &c.
34 222 & 34 223 Western Electric Co. Telephone systems.
34 224 Langdon-Davies & Soames. Electric welding.
34 240 Igranic Electric Co. (Cutler-Hammer Mfg. Co.). Thermally operated circuit controllers.
34 254 Hausen. Accumulator. (4/10/21, Denmark.)
34 262 Chance Bros. & Co. & Lamplough. Glass for use with electric lamps.
34 286 Fuller's United Electric Works & Welch. Galvanic batteries.
34 293 Veifa-Werke A. G. & Kress. X-ray installations.
34 297 Rjorne. Electrodes for arc welding, &c.
34 306 Anderson & Huntsworth. Telephone call counting and registering apparatus, &c.

December 21, 1921.

34 307 Wigley. Adapters or carbon holders for kinematograph work.
34 330 Strong. Switches.
34 345 Croom-Johnson & Tudsbery. Electric rail bonds.
34 348 Coventry & Rushton. Galvanic cells.
34 349 Western Electric Co. Magnetic cores. (21/12/20, U.S.)
34 385 Walton. Device for heating filaments in hot cathode X-ray tubes, &c.
34 398 Callen. Electric vaporising arrangement for using heavy fuel oils in motor-car engines.
34 399 Haddan (Hastings). Mechanism for use in telephony.
34 405 B. T.-H. Co. (G. E. Co.). Insulators.
34 408 Westinghouse Lamp Co. X-ray tubes. (21/12/20, U.S.)
34 431 Westinghouse Electric & Mfg. Co. Magnetic control devices for electric arcs. (21/12/20, U.S.)
34 435 Brown. Artificial lines for cable telegraphy.

December 22, 1921.

34 448 Waterhouse. Circuit connection fittings for electric wiring systems.
34 454 Tucker. Switches.
34 474 Dowey & Vella. Flexible coupling for magneto, &c
34 481 Brolt, Ltd., & Holt. Automatic switches for electric systems of motor vehicles.
34 502 Davis. Switch boxes.
34 503 Eustis. Electrolytic iron.
34 504 Rogerson. Incandescent lamps.
34 510 Automatic Telephone Mfg. Co. Impulse sending devices for telephone, &c., systems.
34 511 Kleinschmidt Electric Co. Printing telegraphs. (22/12/20, U.S.)
34 518 Western Electric Co. Electro-magnetic devices.
34 525 Baron (Aldendorff). Automatic telephone systems.
34 538 Metropolitan-Vickers Electrical Co., Field & Miller. Indicating devices for a.c. generators driving induction motors.

34 540 Siemens Bros. & Co., Barker & Collyer. Prepayment devices for telephone systems.
34 550 Akt. Ges. Brown, Boverie et Cie. Mercury-vapour pumps for high vacua. (8/1/21, Switzerland.)
34 559 Sefton-Jones (Lorenz A. G.). Method for multiple high-frequency telephony and telegraphy on wires.

December 23, 1921.

34 569 Bulpitt & Sons & McGregor. Switches.
34 578 Wilde. Electric signalling and recording device.
34 605 Veritys, Ltd. & Allen. Starter and speed regulator for electrically-driven fans, motors, &c.
34 622 Angus. Devices for enabling forces due to variations in electrical energies to be used.
34 628 Standard Motor Co., Johnson & Maudslay. Electric lighting circuits for motor vehicles, &c.
34 645 Automatic Telephone Mfg. Co. Telephone systems. (21/1/21, U.S.)
34 657 Blondel. Wireless direction finding. (23/12/20, France.)
34 662 British Lighting & Ignition Co., Turner & Tuppen. Ignition magnetos.
34 670 B. T.-H. Co. (G. E. Co.). Switch operating mechanism.
34 672 General Electric Co. & Gossling. Electron discharge apparatus.
34 675 Mollerhoj. Testing insulated wires. (15/1/21, Denmark.)
34 686 Parsons & Rosen. Electric machinery.
34 701 Loubière. Electric heaters for water, &c.

December 24, 1921.

34 706 Thurgood. Terminal for electric wires and cables.
34 718 Lucas & Turner. Switches.

December 28, 1921.

34 786 Holt. Dimming device for electric lamps for motor vehicles, &c.
34 790 Lymburn. Incandescent lamps.
34 825 Peck. Electrical condensers.
34 829 Oswald. Electric lamp bulb fitting.
34 832 Hosie. Propeller shaft to drive dynamos.
34 843 Abraham. Method of interrupting powerful alternating currents.
34 848 Heil. Galvanic cell. (27/12/20, Germany.)
34 865 Siemens-Schuckertwerke. Arrangement for obtaining low voltage current from high voltage networks. (30/12/20, Germany.)
34 868 Ferguson. Trolley poles. (18/5/21, Australia.)
34 871 Blathy. Setting rotating electric meters. (14/4/20, Hungary.)
34 872 Blathy. Setting rotating electric motors. (29/12/20, Hungary.)

December 29, 1921.

34 892 Holland. Combined temperature and switch-controlled regulator for electric fans, &c.
34 898 Bell. Electric timing device.
34 904 Electric Control, Ltd., Ellefsen & Brooke. Controllers for electric motors, &c.
34 905 Wallace. Electrically controlled scoring apparatus, &c.
34 909 Gill-Knight. Electro-atmospheric multiple unit control for electric railways.
34 934 Creedy. Windings for a.c. machines.
34 937 Metropolitan-Vickers Electrical Co. (Westinghouse Electric and Manufacturing Co.). Machines for washing dishes, &c.
34 940 Didies. Accumulators.
34 944 B. T.-H. Co. (G. E. Co.). Circuit breakers.
34 947 Becker. Electric driving mechanism for sound recording machines.
34 959 Powell & Smith. Control switches for electrically propelled vehicles.
34 982 Sefton-Jones (Lorenz Akt. Ges.). Electrode holder for arc generators for production of high-frequency waves.
34 986 Palmer. Telephone transmitters, &c.

December 30, 1921.

35 000 Fellows. Holders for incandescent lamps.
35 009 Blades. Electric plug connecting devices.
35 036 Steyer. Electric lift.
35 037 Siemens & Humphries. Automatic, &c., telephone exchange systems.
35 045 Krupp (F.) Akt. Ges. Overload switches formators started by starting resistance. (3/1/22, Germany.)
35 054 Cadett. Electrical apparatus for starting internal combustion engines.
35 056 Bellini. Directional aerials for wireless receiving stations. (2/5/21, France.)
35 057 Soc. Francaise Radio-Telegraphique. Electrical calling devices. (22/3/21, France.)
35 058 Soc. Francaise Radio-Telegraphique. Wireless telegraph receivers. (30/3/21, France.)
35 078 Pfiffner. Earthing choking coils or voltage transformers for high voltages. (5/1/21, Germany.)
35 079 Anselini & Sernicoli. Arc light stage lighting apparatus.
35 084 Sefton-Jones. Key connection for wireless transmission.
35 087 Quarzlampen-Ges. Irradiation lamps for medical purposes. (30/12/20, Germany.)
35 088 Huth (E. F.), Ges. & Schwarz. Electric transmission of messages along conductors. (30/12/20, Germany.)
35 089 Blathy. System of pole charging for polyphase induction motors. (8/6/20, Hungary.)

December 31, 1921.

35 098 Blathy. System of pole changing for polyphase induction motors. (9/4/21, Hungary.)
35 101 Forges et Ateliers de Constructions Electric de Jeumont. Alternating current motor groups. (26/1/21, France.)
35 128 Monson. Electric treatment of liquids.
35 156 Quarzlampen Ges. Mercury vapour apparatus. (31/12/20, Germany.)

January 3, 1922.

18 A. Kirk & R. C. Milliken. Cleats and cleat cases for electric conductors, &c.
44 J. H. Collings, C. W. Saunders & M. J. Railing. Electric bell, &c., indicators.
65 B. T.-H. Co. (G. E. Co.). Motor controllers.
71 A. R. Taylor. Instrument for measuring capacity and inductance.
86 C. J. Evans. Intermittently operating circuit closing devices.
131 P. Alexander & C. W. C. Beckman. Electrical apparatus.
132 M. Tcharny. Combined electric radiator and projector.
146 W. W. Burnham. Switches.
168 Brush Electrical Engineering Co. Propulsion of torpedoes, &c.
179 B. T.-H. Co. (G. E. Co.). Couplings for insulators.
200 J. B. Tucker. Electric make and break connections.
202 E. Pollock. High-frequency telephony, telegraphy, &c.

January 4, 1922.

207 F. E. Pernot & L. J. Rich. Phase adjustment of electrical systems.
228 A. P. Addison & J. W. A. Waller. Electrical apparatus.
267 B. T.-H. Co. & A. P. Young. Magneto-electric machines.
273 W. B. Sayers. Dynamo electric machines.
297 E. C. R. Marks (Goodman Manufacturing Co.). Controlling devices for electric locomotives.
308 E. de Vries. Combined phonograph and electric lamp.

January 5, 1922.

337 H. W. Cox. Electric apparatus for separating or classifying finely divided materials.
350 C. B. Buchanan & C. C. Johnson. Current collectors.
356 C. F. Shanks. Electro-magnetic clutches.
362 W. Gee. Fuse-carrier for distribution boards.
374 F. C. Raphael. Electric fittings and means for fixing same.
385 E. W. Lancaster. Anti-vibration devices for electric lamps, &c.
395 E. C. R. Marks (Fabbr. Apparecchi F. E. R. T.). Thermo-electric lamp.
397 R. Herzog & C. Lorenz Akt. Ges. Wireless telegraph and telephone apparatus. (2/7/21, Germany.)
407 G. P. Symons. Heating element for radiators, cookers, &c.
416 W. Cunningham & F. L. Shaw. Incandescent lamp holders.
418 Automatic Telephone Manufacturing Co. Telephone systems. (16/3/21, U.S.).
421 A. van T. Day. High-frequency electric signalling. (25/1/19, U.S.)
423 Naamlooze Vennsotschap Philips' Gloeilampenfabr. Electric discharge tubes. (13/6/21, Holland.)
424 Naamlooze Vennsotschap Philips' Gloeilampenfabr. Electric discharge tubes. (16/8/21, Holland.)
425 Naamlooze Vennsotschap Philips' Gloeilampenfabr. Electric discharge tubes. (5/11/21, Holland.)
426 Naamlooze Vennsotschap Philips' Gloeilampenfabr. Electric resistances. (14/1/21, Holland.)
427 Naamlooze Vennsotschap Philips' Gloeilampenfabr. Electric insulating sheets, &c. (8/12/21, Holland.)

January 6, 1922.

462 T. M. Ryan. Automatic recorder of telephone calls.
475 Metropolitan-Vickers Electrical Co. Automatic sub-stations. (14/3/21, U.S.)
482 G. H. Boot. Trolley wheels for current collectors.
486 Scintilla. Electric starters for engines. (15/1/21, Switzerland.)
488 Siemens-Schuckertwerke. Electro-magnets. (16/2/21, Germany.)
496 Automatic Telephone Manufacturing Co. Telephone systems. (3/5/21, U.S.)
500 A. van T. Day. High-frequency electric signalling. (17/7/16, U.S.)

January 7, 1922.

513 C. Oliver. Switches.
516 P. C. Hanks. Drive for dynamos or magnetos.
518 G. Wilkinson. Automatic valves or switches.
522 J. P. Annacker & S. Fildes. Electric tumbler switches.
523 A. R. Angus. Devices to utilise forces due to variations in electrical energies.
526 J. Wilson. Electric lamps.

CONTENTS.

Notes of the Week.

More Criticism.

Sir Harry Renwick's announcement, to which we referred last week, that the County of London Electric Supply Company are prepared to support the Electricity Supply Bill has caused much perturbation in certain quarters. It has inspired the financial contemporary, to whose fulminations we have already called attention, to issue in parallel columns Sir Harry's statements on this subject in 1921 and 1922, and to inquire acidly the reason of his change of heart. Surely the very nadir of criticism! For 1922 is not 1921, and if the electrical industry has learnt nothing else in a short twelve months, it has at last realised that the best, if not the only, way out of the present sloughs of uncertainty and depression is by mutual help and not by internecine strife. Moreover, the 1922 Bill is not the 1921 Bill, and the differences are more than sufficient to explain and justify Sir Harry's change of opinion. We wish, therefore, that more would follow his example and reconsider their views. This reconsideration is, perhaps, most necessary among the smaller, privately-owned undertakings, who have suffered much in the past and have the most to gain from any change.

Our Electrical Bourbons.

One of the points made by Sir Harry Renwick's critic is that the most conspicuous case of failure of the Commissioners' policy is to be found in London, "where the deadlock in the situation has arisen from the refusal of the companies to subscribe capital for a scheme under the control of a joint authority." We know; and we blame the companies for that state of things rather than the Commissioners. They argue, we think mistakenly, that if the purchase clause were extended, they could develop on more economical lines if left to themselves than if included in a Joint Authority, and that some such treatment is their due for the obstacles that have been placed in their way in the past. But this is parochialism at its worst. It leaves out of consideration the lessons of modern electrical experience, it ignores the fact that the London electricity problem, overwhelming as it is, can best be dealt with as a whole, and it forgets that development by sections is the cause of much of the present trouble.

Local Authority Propaganda for the Bill.

We are glad, however, to see that the London County Council, through the Special Committee on Electricity, and the London Conference of Local Authorities have both issued reasoned statements in support of the Bill. This will, we hope, have beneficial results, and it should certainly tend to remove the misunderstandings and doubts in the public mind which have been sedulously propagated by not wholly disinterested persons. On Tuesday, too, the County Council passed a resolution welcoming the introduction of the Bill, and urging upon the Government that in the public interest it should take every step in its power to ensure the passing of the measure in the present session of Parliament. The Conference of Local Authorities, which represent all shades of political opinion, have gone further and have forwarded a statement to members of the House of Lords, in which it is pointed out that Joint Authority schemes contemplate a development of electricity supply in the interests of authorised undertakers, consumers and the general public, but that in order to secure proper results the provisions of the new Bill are essential. It is to be hoped that their lordships will give due weight to the considered opinion of these elected authorities, and that they will not stand in the way of industrial and social progress by rejecting or mangling such a useful measure as the present Bill.

Standard Starters.

From many points of view the discussion of the British Engineering Standards Association starter specifications at a recent meeting of the Institution of Electrical Engineers

missed fire, and it is, therefore, fortunate that the discussion was adjourned. For the subject is most important, and, perhaps, more than other problems dealt with by standardisation, may be divided clearly into two principal sections: What to do and how to do it. With starters, the second of these sections is the simpler. Given a standard rating, which would enable purchasers to make a fair comparison between types of starter, there remains the necessities of good workmanship and attention to detail which are common to all properly designed and manufactured apparatus. To take an example under the heading of " Joints," it is stated that no soldering shall be used on the connections between units, and that all joints must be mechanically secure. That is a point upon which agreement will be instant among all well-conducted manufacturers, and is, therefore, in a very different category from the controversy which arises when the vexed question of rating is mentioned.

Compromise, Not Revolution.

That this is a vexed question can also be shown by example. In the specification for contactor starters, the maximum currents which shall pass both on the first steps and on each of the subsequent steps is stated. For 10 H.P. starters the maximum current permissible is two and a half times full load current on the first step and three times full load current on the subsequent steps. Yet many municipal electricity supply departments in this country object to such high currents, and it would be interesting to know whether they will accept the change. To do so would only mean the alteration of regulations. On the other hand, as Mr. J. T. Mould pointed out in the discussion, each starter maker has his own standard (for rating among other things), which he may be forgiven for thinking quite as good as those of the B.E.S.A., with the sole exception that they are employed particularly rather than generally. The work of the B.E.S.A. has, therefore, been one of co-ordination rather than erection, and of compromise rather than revolution. As yet the specifications are in a draft stage and are, therefore, in a form inviting and convenient for discussion. It is the duty of those interested to play their part in welding them into a final form. This, as Mr. Wordingham pointed out, may be a matter of years, but if it is well done it will be none the worse for that.

An Impudent Claim.

As we have often pointed out, of all the forms of taxation the Corporation Profits Tax is the most pernicious and inequitable in its incidence, for, though it is nominally levied on companies, its burden really falls on the ordinary shareholders, one class being thus singled out for special taxation. But, bad as it is when fairly and equitably assessed, it is worse when claims such as that made upon the Central Electric Supply Company become common. This is, in fact, a clever, though a most unwarranted, attempt to extend the operation of the tax. Public utility companies are exempt from the tax until December 31 next, provided that their charges to the public are limited by statute. The Act which established the Central Company has no such express limitation, but as the Company does not give a retail supply to the public, but only a bulk supply to the St. James' and Pall Mall, the Westminster and Chelsea Supply Companies, whose charges are limited, we cannot see the justice of the claim. The companies are, we are glad to see, resisting the demand, as it really amounts to the taxation of something which is definitely exempted by statute.

160 000 kVA Turbo-Alternators!

America has long been recognised as the home of everything that is gargantuan, from oratory and skyscrapers to the production of motor cars, but according to information given in the " Times Engineering Supplement," the palm for turbo-alternators will now have to be conceded to Germany. For Prof. Reichel has designed a real superstation to contain six 160 000 kVA units! Such a station would have a possible annual output of 2 000 million kilowatt hours, and five of them would be able to supply the whole country. As regards details, the proposed station will contain 100 steam boilers, each with a heating surface of 10 750 sq. ft., producing steam at a pressure of 285 lb. per sq. in. and a temperature of 350 deg. C. The quantity of cooling water needed would be from 1 200 to 1 400 cu. ft. a second. The annual coal consumption would be some $2\frac{1}{4}$ million metric tons, and in close connection with the boiler house there would be a coal store capable of holding 100 000 tons, sufficient for two weeks. The coal would be transported to the power station in trains composed of thirty forty-ton trucks, which would be constantly working between the station and the coal mines. The ash would be removed in tipping cars by battery locomotives. In the boiler house, which would measure about 490 ft. by 590 ft., the boilers would be arranged in ten rows of ten each.

Generator Details.

The total weight of the generator of a 160 000 kVA unit would be about 600 tons, of which 222 tons would go to the rotor and the remainder to the stator. The weight would thus be about $8\frac{1}{2}$ lb. per kVA. The diameter of the rotor would be nearly 9 ft. and its length over 13 ft., while the outer diameter of the stator would be over 18 ft. The two bearings would be $28\frac{1}{2}$ ft. The turbine is designed as a double-flow machine, with steam admission in the centre and exhaust at both ends. We shall be interested to learn the future developments of this scheme. It seems to be advancing rather fast on a road of which some electrical engineers are a little fearful.

Newcastle-upon-Tyne Company's Results.

We regret to notice that the operations of the progressive and well-managed Newcastle-upon-Tyne Electric Supply Company have been so affected by the coal strike and by the industrial depression on the North-East Coast that the ordinary dividend has had to be passed. For the past four years the distribution has been at the rate of eight per cent., and it is unfortunate that an excellent record should be broken. When, however, it is remembered that the interest charges on additional debenture capital required for extensions absorbed £48 500 more than in the previous year, and that there was a drop of nearly £48 000 in revenue from the sale of current the position will be understood. We are convinced that the set-back is merely temporary, and that the company and its associates will recover rapidly as soon as trade begins to revive once more. The company is the largest supply authority in the kingdom, and it has been obliged to make heavy issues of debenture stocks to provide for extension work in hand and for the general expansion of business. This additional capital has not yet become remunerative, but as soon as the tide of industrial prosperity turns, as assuredly it will, the company will reap the reward of its foresight and bold enterprise. Within the last few days the company has sustained a more personal loss in the death of its present vice-chairman and former chairman, Dr. J. T. Merz. Dr.

Merz was, in fact, one of the founders of the company, and its undoubted success was largely due to his careful direction.

B. and K. Progress.

We have often contended that the policy adopted years ago by the Brompton and Kensington Electricity Supply Company ought to be more widely followed, if only on account of the fact that it has been justified by results. What that policy is need not be stated here, and we may confine ourselves to saying that in 1921 the company connected more consumers than in any previous twelve months, excepting only 1919 and 1920, that they sold more current per lamp installed than in the previous year, and that the gross receipts showed an increase of 7½ per cent. over the record of 1920. This continued progress is due mainly to conversion of the larger houses in the area into flats and maisonettes, to the growing use of labour-saving devices, and to the low charges imposed. There will be those that contend that the B. and K. Company are very lucky, but then luck has been defined as the child of hard work and enterprise. Incidentally, it is interesting to learn that saturation is still far off even in this well-developed area.

A Great Railway Amalgamation.

The announcement that a provisional agreement for fusion has been reached between the extended London and North Western and the Midland Railway Companies will be interesting to electrical engineers from several points of view. After the end of the present year this combination will result in the elimination of competition for goods and passenger traffic in a wide area of the country, and will erect a gigantic organisation whose operations, we hope, will be neither too oppressive nor too slow moving to affect adversely the development of the country's trade. The effect of this fusion on the progress of electric traction in this area will also be watched with interest. The present London and North Western Railway has already two systems in operation on different parts of its line, while the Midland, as we showed a little earlier in the year, has made some interesting experiments with single-phase working, which were intended to lead to more fruitful results.

Its Effect on the Electrical Staff.

More important than these, however, is the effect the reorganisation is likely to have on the staff of the two systems, and especially on those concerned with carrying out the electrical work. We have already called attention to the retrograde step taken by the extended London and North Western Railway in practically placing their electrical department under the orders of the chief mechanical engineer. Is this policy to be extended in this further amalgamation, or is an opportunity to be taken of repairing a mistake and once again establishing a separate electrical engineers' department under the leadership of a man responsible solely to the directors? We sincerely hope the latter.

The Great Stoppage.

We are afraid that the debate, which took place in the House of Commons on Monday, on the lock-out of the members of the Amalgamated Engineers Union by the Engineering Employers' Federation has not brought peace much nearer. We scarcely expected it would. For these debates are too often conducted in an atmosphere of unreality and acrimony, and are seized by doctrinaires and interested persons as an opportunity for putting forward all sorts of impossible ideas and arguments, which, if they do nothing worse, generally serve to cloud the issue. Nevertheless, some important points were made to which attention may be drawn, for their consideration has effected what the debate itself failed to achieve—a meeting together between the Joint Labour Council and Sir Allan Smith, with what we hope will be satisfactory results.

A Breach of Faith?

Mr. Clynes derided the employers' contention that to carry on their business they must be the authority to decide when overtime shall and shall not be worked—and all that decision implies. He found in the employers' action a breach of faith, but as Mr. Gould pointed out, the condition which the trade unions wished to enforce would interfere with the management, and was therefore contrary to the terms arranged. Industry was paralysed by present conditions, and the lock-out had only anticipated by a few weeks what would inevitably have come about for other reasons. Comparisons of pre-war and existing costs in the shipbuilding trade, and examples of the opposition that the employers have to face in reducing production costs in order to increase trade, which he gave, combine to form a dark picture of both the present and future chances of industrial recovery, and indicate the extraordinary ignorance to their own interests which exists among the workers. This is shown particularly in their indifference to the ballots, with the results that harmful decisions are come to by a small minority of the trade union membership. One speaker on the Labour side seemed to think that when 21 per cent. of the total membership had voted, a good showing had been made. The proper organisation of the ballots and the careful explanation to the voters of the issues are both matters which Trades Union leaders would do well to deal with without delay.

Mr. Hopkinson on the Situation.

Mr. Austin Hopkinson's criticism was that the members of the Engineering Employers' Federation were not at present exercising managerial functions, the Federation doing that for them. But even if that be so it is surely better for these functions to be exercised by a body which is working in the employer's interests rather than by a Trade Union, or by shop stewards, whose policy, through ignorance, is antagonistic. This point was stressed by Sir Allan Smith, who pointed out that to give the men what they wanted would be to introduce a right of veto which would prevent employers in practice from managing their own factories, whatever it might do in theory, and that it was only on the abrogation of the demand for that right that employers would consent to negotiate. This attitude was not taken up in any spirit of opposition to the Trade Unions, whom the Employers' Federation wished to see in the strongest possible position. This is the olive branch to which we have already made reference.

The Industrial Court Difficulty.

But the most important part of the debate was the position disclosed by Dr. Macnamara, as a result of appeals made by a number of speakers to set up an enquiry under the Industrial Courts Act. This is a weapon which, as Mr. Clynes pointed out, has been forged for such an occasion as this, but it is a weapon which the Government is very reluctant to use until it is, as often as not, too late. Dr. Macnamara said he had done his best to bring the parties together, but that he could not set up the Court until the ballots now being taken were completed; in the hope apparently that they would be favourable to peace and that the

Court would then be unnecessary. Nevertheless, he urged both parties of their own motion to come together and compose their differences. It is, having in view all the circumstances, an extraordinary attitude to take up—and not a little puzzling.

The Results of it All.

Meanwhile, the dispute goes on, and every day matters go from bad to worse. Mr. Gould tells us that trade can never recover under present conditions, but with a lock-out in progress it cannot recover under any conditions. We are face to face with overpowering foreign competition. A lock-out will not help us to resist that. A lock-out will mean increased unemployment, not only among those who work with their hands, but among those who work with their brains. It will mean decreased expenditure on research at a time when every available sum should be spent on increasing our knowledge of the materials with which we work. It will mean the stamping out of that spark of reviving trade which we have been long expecting at a time when it is just appearing amidst the smoke. It is not much credit to either side that a stoppage of work and production has occurred at such a time.

The North-West Midlands Inquiry.

The scheme for the reorganisation of electricity supply in the North-West Midlands District, which was recently investigated by the Electricity Commissioners, is one of the best and most complete that we have seen, both from the administrative and technical points of view. The report of the proceedings at the inquiry gave us the impression that it was put forward purely in the interests of the municipal undertakers, but we are pleased to find that this is far from being the case, and that the scheme, which was backed by all the supply authorities in the district, gives equitable representation to both companies and local authorities.

Representation on the Authority.

Each undertaker will be entitled to appoint one member on the proposed Joint Electricity Authority for each £200 000 of gross revenue per year, and the representation is so graduated that five members are given for a gross revenue not exceeding £200 000, with an additional member for each £100 000 in excess of this amount. One vote will be allowed for each £20 000 of gross revenue. On this basis The Midland Electric Corporation for Power Distribution will have a larger representation and voting power than any of the local authorities, and the small supply companies operating at Church Stretton and Market Drayton will also be represented on the Joint Authority.

Very little exception can be taken to any of the administrative provisions, as they seem to be designed with a view to the mutual co-operation and assistance of the whole of the undertakers rather than to secure any special advantage for any class. This has always been our opinion, as we believe that until the causes of friction between the municipal and company undertakers have been removed no satisfactory progress can be made.

Powers of Authority.

The Electricity Authority may exercise any of its powers and duties through any undertaker, and it may act in an advisory capacity in respect of the generation, transmission, and distribution of all electrical energy in the district. In regard to areas not at present supplied with electricity, the Authority is to provide for this as the demand arises and it is economically possible to do so, by recommending the Commissioners to extend the area of supply of existing distributors or by the creation of new authorised distributors. This is a very sensible way of dealing with a subject which has been greatly misrepresented by interested parties.

Financial Clauses.

The clauses relating to finance are mainly based on the powers to be conferred by the new Electricity (Supply) Bill, and will enable authorised undertakers, local authorities, and consumers to render financial assistance to the Joint Authority. The provisions governing the application of revenue are very full, and we are pleased to see that the charges for electricity supply are to be regulated with a view to securing that receipts shall meet expenses, and that in fixing prices regard is to be had to the annual load factor, the quantity taken, and the cost of transmission. With a policy carried out on these lines there will be little risk of a deficit on the year's working and, therefore, there will be no need to fall back on the rates. This point needs emphasising because certain unfriendly critics have so misrepresented the facts that the public have very erroneous views on the subject of Joint Authorities.

Technical Details.

The technical side of the scheme seems to have been prepared with as much care as the administrative. The proposed system of supply is the standard three-phase, with a periodicity of 50 cycles. Generation is to be at 6 000 to 6 600 V, main transmission at 30 000 to 33 000 V, and secondary transmission at 6 600 to 11 000 V. The generating stations at Ocker Hill, Stafford, Hanley, Walsall (Birchills), West Bromwich, and Wolverhampton, are to be transferred to the Authority, but later it is contemplated to acquire the stations at Shrewsbury, Leek and Market Drayton. None of the existing generating stations is to be shut down immediately, but after certain interlinking transmission cables are laid and economic conditions warrant it, all the d.c. stations and plant, and, when conditions justify it, the most uneconomical of the existing alternating current plant will also be shut down.

New Generating Stations.

The erection of three new capital stations (at Rugeley, Ironbridge, and near Stone) is contemplated, and the sites have been chosen because of the transport facilities, availability of cooling water and coal supplies, and their proximity to the heaviest load centres. For the first five years the capital expenditure will be £2 913 000, and this figure includes the erection of the first section of the Rugeley Station, about 38 000 kW of plant at the existing stations, the first section of the transmission mains, together with the estimated cost of transformer plant and the purchase price of the two other station sites. The ultimate capacity of the three new stations would be 260 000 kW, viz., 80 000 kW at Rugeley, 150 000 kW at Ironbridge, and 30 000 kW at Stone. Provision is also made for the supply of energy for electric traction and power to the Railway Companies when required, and for the supply in bulk to the two tramway generating stations at Stoke.

Conservative Estimates.

Though no figures are given, it is clear that if existing undertakers were required to meet their obligations in their own areas, without regard to other districts, it would be necessary to erect several new stations, and the aggregate capital expenditure would be much greater than that of the Joint Authority, which, it is calculated, will be able to save 100 000 tons of coal per annum in the first stage. The maximum load on the local station feeders five years hence will be 76 105 kW, the units required per annum

will be 191 068 500, and, after debiting all charges and supplying the authorised undertakers at an average of 1·15d. per unit, there will be a balance of £22 107 for the creation of a reserve fund. If anything like this result can be achieved there can be no question of a deficit to be met out of the rates, while the present distributors will gain a decided advantage.

The estimates appear to err on the side of caution, and we are not surprised to learn that there was no opposition to the main principles of the scheme. There was, however, a claim for representation of large consumers on the Authority, and frankly we think it would be a good thing for both parties if this were conceded. Walsall also put forward a scheme of its own, but as this would cover only a small part of the Electricity District it cannot be treated as a serious attempt to find a solution of the problem set by the Electricity Commissioners.

A Brighter Institution.

Events at a recent meeting of the Institution of Electrical Engineers point to the necessity for a change in the procedure followed at these gatherings. On the occasion in question three Papers were down to be read, and their exposition was to be followed by a general discussion. The first of these Papers was short and generally explanatory. It took but a few minutes to read. The second dealt in an exhaustive manner with the high technicalities of the design of certain electrical apparatus, and was long and involved. Its author therefore wisely refrained from attempting to read it, even in abstract, and contented himself by giving a short illustrated lecture on the ideas with which he had dealt at length in the Paper. This was interesting enough, but would have been better if the speaker's elocution had been of a higher quality. The third Paper had already been read and discussed at one of the Territorial Centres, and had been published in the "Journal." Nevertheless, the author took up a considerable amount of time giving another illustrated lecture on its subject in which slide followed slide so rapidly that mental indigestion set in.

A Feast and its Results.

The result of this feast of good things was that it was seven o'clock (one hour after the opening of the meeting) before the discussion, which is after all the main object of these gatherings, could be started; and by that time the meagre audience were obviously becoming exhausted. An appeal from the chair that speakers should be brief had a further withering effect on the eloquence of those taking part, and finally the meeting came to the usual, but rather disappointing, full close at a late hour.

Change in Procedure Necessary.

We have given the history of this affair at full length because in exaggerated form it is what too often occurs at these Thursday evening meetings, and because its effect on those present and on the work of the Institution is so unsatisfactory that it is worth while making an examination to discover whether matters cannot be improved. For interesting discussions are, we fear, the exception rather than the rule. It appears to us, indeed we know it to our cost, that the chief thing wrong with the Institution meetings is bad elocution. Elocution, we are aware, is not a subject of instruction at technical colleges, but where speaker after speaker rises and mutters in tones which can just be caught by those near him, or reads rapidly from manuscript in an almost inaudible voice, we heartily wish it were. There are, we admit, speakers who can speak, but they are very few. This, obviously, is a matter in which the Council can do little or nothing; but members themselves ought to take it in hand, and remember that an argument is doubly cogent when it can be heard.

Publication in Advance.

The Council might, however, consider whether the time has not arrived when Papers for discussion should be published in the "Journal" sufficiently far ahead of the meeting for their contents to be available for any member who wishes to study them. It would not then be necessary for the Papers, or even abstracts of them, to be read at the meeting, and the discussion could be begun at once. If this plan is considered too iconoclastic, it might be modified by permitting the author ten minutes in which to explain any points in his Paper which were not clear or had been modified by the lapse of time since publication. But this concession should be granted sparingly, as such points could be as well, or better, dealt with in the reply. The speakers in the discussion should be required to speak extempore or from notes, and should not be permitted to read Papers. A rigid time limit should not be imposed, but irrelevancy and the discussion of points not dealt with in the Paper should be severely checked. If more speakers than could comfortably be dealt with in one evening desired to take part in the discussion a second evening should be allocated. And the meetings should not be too long. For it must not be forgotten the prime object of the meetings is instruction, and that learners soon get tired.

The Disadvantages of Stage Management.

It is generally known that with a laudable desire to improve the interest of the meetings a certain amount of stage management is in force. That is, members who are interested in the particular subject to be discussed are asked to take part, and human nature being what it is, doubtless consent even when they have nothing particular to say. The result is a welter of speakers, a pointless discussion, and not a little disappointment because some of those who have been requested to speak have not been given an opportunity of doing so. It is organisation *in excelsis* with the usual results.

Some Suggestions.

We have tried to make these criticisms constructive as well as destructive, for attending as we do practically every meeting that is held, we feel a miasmic atmosphere gradually creeping over the proceedings at Savoy Place. We realise that some stage management of the meetings is necessary, but we also feel that it is being conducted on the wrong lines. The Papers Committee must have no lack of choice of Papers, and this year they have done wisely in making the subjects discussed at the meetings cover as wide a range as possible. They could do more in this way by grouping Papers on related questions and having them discussed together. This would allow more time for discussion. It is also a matter for consideration whether fewer Papers should not be publicly discussed, giving more time for the discussion of those that do receive that treatment.

But whatever methods are adopted for bringing about a brighter Institution the success of those methods must lie with the members themselves, and especially with those members who take part in the discussions. When the informal meetings were started it was stated that they would be a useful school for the younger members. It is our experience that it is time some of the members who take part in the formal meetings attended that school not to speak but to listen and learn.

Regenerative Braking and Single-Phase Commutator Motors*

By B. NORDEFELDT.

(Concluded from page 314.)

Arrangements for Rotating the Phase of the Excitation.

For producing phase displacement between the armature and excitation voltages different methods may be employed. Those hitherto employed have been either to use a special exciter of the commutator type, the field of which is fed with single-phase current from the transformer, or to create an auxiliary phase by means of a two-phase asynchronous motor driven by one phase only, or by means of a phase converter of the commutator type. The use

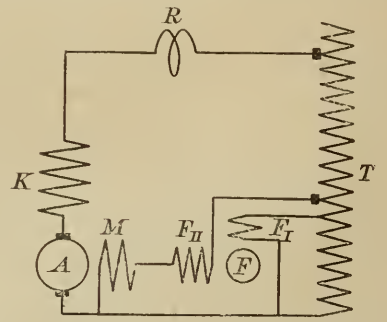

Fig 8.—Excitation by Phase Convertor.

of an asynchronous motor is a very simple method, especially as the motor can also be utilised mechanically on the locomotive. A diagram of such an arrangement is shown in Fig. 8, where the asynchronous machine F has a short-circuited rotor and two stator windings F_I and F_{II}. The transformer voltage is introduced on F_I, and the quarter-phase field produced in rotation induces a voltage in F_{II} which leads that of F in phase. These two voltages combine to give an excitation voltage of suitable phase.

Commutator machines may also be used as phase converters, although asynchronous machines would be better. On a locomotive constructed for the experiments on the French Midi Railway by the Compagnie du Nord et de l'Est de Jeumont (where the phase of the excitation was rotated fully 90 deg., and the phase of the transformer voltage was regulated accordingly) compensated repulsion motors were employed both for braking and for driving ventilators and compressors.

As already stated, a separately excited single-phase generator can also be employed. This however involves a considerable addition to the weight unless, as has been proposed by the A.E.G., one of the motors in a two or more motor locomotive is used as exciter, and the other as the main generator or generators. Fig. 9, which is reproduced substantially from an article by L. Monath in the "Elektrotechnik und Maschinenbau," 1919, No. 41, shows the arrangement. The speed characteristics of such a connection differ rather widely from those already described, due to the fact that the excitation decreases proportionally with the speed. The required characteristics are most easily obtained by replacing n by $\frac{n^2}{n_1}$ where n_1 is the normal speed in the above expressions. Samples of such curves are given in Fig. 10. The angle a is here assumed constant and equal to 30 deg., but the excitation of the

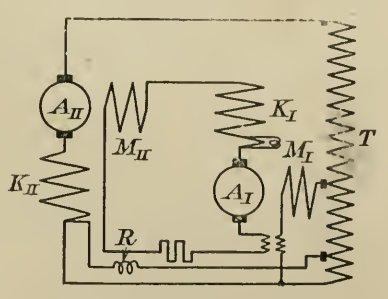

Fig. 9.—Separate Excitation.

exciter is increased for each step in the same proportion as the transformer voltage is reduced. This is necessary to avoid too large fluctuations in the current and braking torque. The curve for cos φ is here drawn only for the highest voltage step.

A comparison with Fig. 6 shows what much more pointed current curves and how much more rapid a decrease of braking torque with the speed are produced by this arrangement. It is obvious, therefore, that this method cannot be employed for braking to rest, as this would necessitate too many voltage steps in both the main and excitation circuits.

If, however, the main purpose of the braking is to prevent a certain speed being exceeded on long down grades, the fact that the braking torque increases rapidly with the speed may be an advantage.

Control of the Braking Action.

The question of controlling the generators during the braking period, which has been touched on in the preceding paragraphs, will now be treated more fully in comparison with the direct-current system such as is used on the Chicago, Milwaukee and St. Paul Railway.

When the direct-current machine is running as a series motor, it adapts its speed automatically to the excitation, or its excitation to its speed. If it is reconnected as a generator with separate and controllable excitation, the latter must be regulated very exactly with respect to the prevailing speed to avoid a rush of current. As it cannot be supposed that a motorman will know the speed of the train exactly, the problem has been solved by placing the excitation winding permanently in series with the armature, but successively impressing a voltage thereon from outside which keeps the exciting current constant or slightly increases it, although the armature current will gradually change its direction. The armature of the exciter is then traversed by the sum of the exciting and armature currents of the main machine

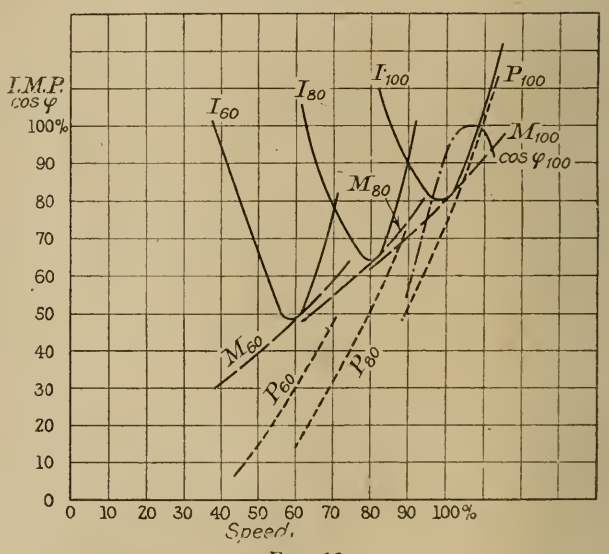

Fig. 10.

and must be designed accordingly. Even this arrangement has, however, not proved sufficient to prevent dangerous rushes of current, as a recent accident on the Chicago, Milwaukee and St. Paul Railway showed. To avoid such rushes, the motorman was prohibited from using the regenerative braking on freight trains at speeds below fifteen or above twenty miles per hour. The speed was slightly in excess of the latter value when the braking was begun, with the result that the cut-out came into action, and as the air brake also failed, nearly the whole train was wrecked.

Current Rushes on S.P. Systems.

A connection of the kind just described cannot be regarded as practically possible on the single-phase system, at least, not if a separate machine is employed for rotating the phase of the excitation. For the reason that the exciting power is mainly reactive power, the machine delivering it will be rather large for its own current and cannot be increased to carry the vector sum of this current and the armature current, which sum approaches the algebraic sum for small values of a. There is, however, no need for such a connection in the single-phase system, as the start of the braking operation can be made sufficiently smooth without it. If, for instance, an a value of 30 deg. and an excitation independent of the speed are chosen (Fig. 6), it is obvious that not even connecting the generator to the full transformer voltage

*Abstract of an article in the "Teknish Tidskrift."

at full excitation will give an undue rush of current if the speed is between 1·4 and 0·35 times normal. (These two limits correspond to 30 per cent. excess current, which is a very moderate value.) If a full braking torque cannot be avoided for mechanical reasons, the controller may therefore be shifted directly from the off position to a position corresponding to full voltage on both the excitation and the armature circuits. A transition step with, for instance, 3/4 voltage on both circuits will, however, give smoother braking, as the torque will be only half normal during that period. A really dangerous rush of current will never occur.

Single-Phase Gives Smoother Braking.

It is thus found that the passing from motor to generator action is not more, but rather less difficult in the single-phase than in direct-current systems. Moreover, the former, as already stated, has the advantage of permitting the braking down to low speeds, which would be very difficult in the continuous-current system, and therefore, probably, has not been practised. Even with the single-phase system, mechanical braking at the moment of stopping can, of course, not be avoided, but the main advantage lies in the possibility of running at widely variable speed on the same controller position without unduly loading the machine. This advantage is, however, characteristic only of the system with direct excitation from the transformer or with a phase converter; with the A.E.G. system such large variations of the speed cannot be permitted.

Further, it should be noted that the latter system cannot be employed in locomotives having only one motor, while in two-motor locomotives the motors are not uniformly, and therefore not completely, utilised. It has been proposed to interchange their functions occasionally, but this would make the apparatus still more complicated.

Heating Conditions in Regenerative Braking.

In connection with the last-mentioned question it may be asked whether the use of regenerative braking increases the cost of the motor equipment owing to heating. This question involves many factors and must therefore be examined. Traction motors of substantial size are now almost always provided with forced cooling, which brings the time-constant down to a rather low value. The larger the motor, the greater care must be paid to the cooling, whence the time-constant can be regarded as about equal for large and small motors, or about 10 to 20 minutes. This means that 90 per cent. of the final temperature is reached in 25 to 45 minutes. As it is often necessary to run the motors at full load during such periods, they must generally be dimensioned for nearly continuous full load, whether they are utilised for regenerative braking or not. Under such circumstances braking does not necessitate more expensive motors.

Increase in Weight.

The additional devices on a locomotive necessitated by the regenerative braking are: In the Oerlikon system, a rather large reactance coil and some small controlling apparatus: in the system with a special exciter or phase converter, this machine, together with a small reactance coil and some controlling apparatus; and in the A.E.G. system, a small reactance coil and some rather complicated apparatus. The reactance coil in the Oerlikon system must be dimensioned for more kVA than the transformer, but, it is stated, that by reason of its low voltage and high space factor its weight can be reduced to less than 4 per cent. of the total weight of the locomotive. In systems having phase converter, the latter will be greater the smaller the reactance coil. The total weight will always be greater than in the Oerlikon system, but, on the other hand, the advantages of a better power economy and more efficient braking are obtained.

The Commutation Problem.

An important matter in the operation of single-phase machines is the question of commutation. As is known, there is induced in the coil short-circuited by the brush—besides the usual reactance voltage caused by the commutation, which voltage, from the viewpoint of the line frequency, is in phase with and in the opposite direction to the current—a transformer voltage induced by the main field of the machine. This latter voltage, in a motor, is 90 deg. behind the former in phase, but in a generator is behind the field, which leads the current by the variable angle $(90°-\beta-\gamma)$. During generator operation, the correct phase of the commutating field cannot thus be obtained by shunting the winding by an ohmic resistance, as in motor operation, but other methods must be tried.

The most obvious of these, which, however, gives the correct phase to the commutating field only at a certain speed, is to impress on the commutating winding a voltage proportional to and in phase with the armature voltage. A method of this kind has been employed in the A.E.G. system and is illustrated in Fig. 9. The current component generated by the said voltage lags practically 90 deg. behind the machine voltage, and this is the case also with the corresponding field, while the main field is in phase with the machine voltage. The field component added in this way has thus the correct phase, but its strength varies in direct proportion to the speed of the machine, instead of inversely, as it ought.

A field component which is constant, independently of the speed, is an improvement hereof and can be obtained by connecting an ohmic resistance to the terminals of the magnet winding in series with a current transformer, both of sufficient size to substantially determine the phase of the secondary current of the latter, which current is introduced into the commutating winding. It is also possible, by special means, to provide a field component which varies inversely as the speed of the machine.

The commutation problem can, therefore, be regarded as solved in regenerative braking, although it will not be so simple as in motor action.

Review.

Electrical Rates. By G. P. Watkins, Ph.D. (New York: D. Van Nostrand Company). Pp. 228. $3.

While what is called a "multipart tariff" is very generally approved, the basis of the fixed charge in such a tariff is the subject of much discussion and difference of opinion. It is generally considered that ultimately load factor should govern the charge, but other considerations have to be taken into account such as (*a*) the capital cost of the services required by, and the special charges directly due, to a particular consumer, and (*b*) the proportion of the cost of the distributing network properly chargeable to the supply.

The items included in (*a*) termed "consumer cost," by Dr. Watkins, can be readily calculated and are of considerable importance in the case of a small consumer; those under (*b*) are not so easily ascertainable, but are nevertheless of vital importance in these days of high costs of mains. The author analyses the effect of this item of cost, and proposes that it should be dealt with in the "rate schedule" by means of discounts based on "density factor." While the solution may not be satisfactory, there is no doubt that "density factor" (or units sold per yard of frontage) as well as "consumer cost" have an important bearing on cost of supply, and may under certain conditions entirely swamp the effect of "load factor" in an allocation of costs.

It is not to be thought that "density factor" is brought into account in all American tariffs, or rate schedules; on the contrary, this is a new suggestion on the part of the author of this book, but one that undoubtedly deserves careful consideration.

The book is a careful survey of the whole question of fixing the price, or rather prices, at which electricity can be sold by an Electricity Supply Undertaking, written from the standpoint of an economist. Though the book is naturally based on American practice, the author having been statistician to the New York Public Service Commission, it is full of interest, and while from the nature of the subject it is not light reading, it is ably written and is evidently the result of a great deal of thought and experience. Dr. Watkins claims to be a non-technical man, but his grasp of a complicated subject is complete, and the book will repay careful study by Supply Engineers in this country.

We naturally turn to see how American practice differs from British, and, though it is not directly connected with tariffs in England, it is interesting to note that "The substantial displacement of other types (of lamp) by tungstens has already, in 1919, become an accomplished fact." Surely in most towns in Britain it was an accomplished fact in 1914; probably the reason that the change over in the States was slower, is that a great many if not most of the American Supply Undertakings provide lamps free of charge.

Apparently the difficulties in the States in framing a "rate schedule," are very similar to, if not identical with, those on this side of the water, and the author discusses the "minimum charge," "consumer cost," "Wright system," "Hopkinson system," in addition to the "density factor" mentioned above. "load factor," and all the other problems that are so familiar to the Electricity Supply Manager, but which are so difficult to deal with satisfactorily in a tariff of charges.

The author's suggestions for a model rate schedule are full of interest, but it would be quite as complicated as any tariff in force in English undertakings.

The terminology employed in the book is very precise, and appears to be based on definitions published by the National Electric Light Association, as the result of the work of their Rate Research Committee. The B.E.D.A. might undertake similar work in England; at present anyone writing on this subject is in great difficulty owing to the absence of accepted terms.

For the benefit of the Britishers who read this review, it may be mentioned that the book is written in excellent English, with an entire absence of "Americanese" (which, after all, is no worse than our "journalese"), and that the amount of "new" spelling is negligible.

W. A. Vignoles.

Electric Motor Starters.*

By J. ANDERSON.

The author deals with the development of an electric motor starter from first principles, defining what is meant by starting, accelerating, and using torques, and referring to the lack of data regarding starting conditions. Having given a means of estimating the accelerating time or torque, the author considers the application of these facts to step-by-step starters.

To obtain a clear idea of the action of a step-by-step starter, acceleration may be conveniently classified as natural regular acceleration, natural irregular acceleration, forced regular acceleration, or forced irregular acceleration. When rotation commences, the speed rises until the back E.M.F. cuts down the current to an amount which gives rise to a torque just sufficient to overcome the running friction or load at that speed. When the starter arm is moved to the next notch to cut out resistance there is a

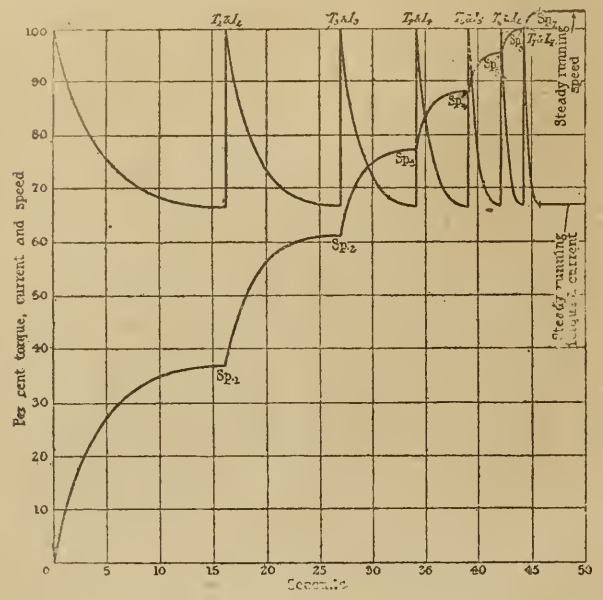

FIG. 1.—TORQUE/TIME AND SPEED/TIME CURVES FOR 7-NOTCH STARTER PASSING 100 PER CENT. CURRENT ON LAST NOTCH WITH MOTOR HAVING 66·6 PER CENT. LOAD. STORED ENERGY: 1 000 FT.-LB./B.H.P. MOTOR RESISTANCE: 8·8 PER CENT.

current-rush, the peak of which is determined by the ratio of the first resistance to the second, and which gradually dies away as the speed and back E.M.F. rise until balance is restored and the current corresponding to the running torque at the new speed is flowing.

If this is repeated on the third and subsequent notches and all the peaks and valleys are equal, the acceleration is called "natural regular."

Fig. 1 is drawn for a load of 66·6 per cent., the stored energy being 1 000 ft.-lb. per B.H.P., the motor resistance 8·8 per cent., ratio of resistance from notch to notch 1·5, and the current on the first notch and on subsequent peaks being 100 per cent.

Data for Correct Accelerating Time.

It is drawn for the correct accelerating time on each notch and these times are in proportion to the ratio of the resistances.

It is essential to know the motor resistance, that is, the resistance of field and armature for a series motor, and of armature only for a shunt motor. Armature resistance includes brush gear, commutator and connections. The starter maker, in the absence of this data, has to underestimate the motor resistance, and this frequently means the addition of another notch or two on the starter, with correspondingly increased selling price. There is no correct number of notches for a given horse power because, in general, the greater the number of notches the better the starter.

Fig. 2 shows a good example of natural irregular acceleration; it is drawn for a centrifugal pump load starting at 7½ per cent. and ending at 100 per cent.

A great deal has been written on the relative merits of current relays and pressure relays. In Fig. 3 the relays on notches 2, 3, and 4 must be set for 32·48, 69·18 and 87·03 per cent. pressure respectively to realise that diagram on full load. It would seem that there is no advantage in a pressure setting versus a current setting; on the contrary the relays must be more difficult to standardise, wind and adjust.

* Abstract of a Paper read before the Institution of Electrical Engineers.

Determination of Accelerating Torque.

Reverting to Fig. 1, it is necessary to indicate how the accelerating torque over the period is determined. If the running torque is 66 per cent. the excess torque in the time available for acceleration is represented by the area of the peaks. The average over the period works out at one-quarter of the excess of the peak over the valley, giving in this case 8·5 per cent.

It has been found that, as a working basis, the breaking capacity required from notch to notch is given by the maximum current at the maximum pressure. The law connecting amperes and volts for a given quick break switch and a given breaking distance in air is of the order of

$$\frac{(\text{Amperes})_2}{(\text{Amperes})_1} \propto \left[\frac{(\text{Volts})_1}{(\text{Volts})_2}\right]^{1\cdot5}$$

At the "off" position, two conditions have to be considered; first, making and breaking on the first notch, with the motor "stalled"; and second, breaking to "off" position when the starter arm is allowed to fly back from the full "on" position. In the first case, the power to be broken is the current on the first notch at line pressure. This is an onerous condition, particularly as the circuit is inductive, and no ordinary starter should be subjected to it. In the second case, practically no load is broken.

Form and Rating of Resistance Elements.

The next stage is to determine the form of the resistance elements, the method of support and cooling, and how the taps are to be taken off, &c. Then comes the real difficulty, that is, rating the element. Rating falls into two main divisions, continuous and intermittent. Continuous rating need scarcely be considered in the case of a pure starter, as it affects speed regulation only. But some starting conditions require a rating that is practically continuous.

The continuous rating of an element offers a fairly difficult

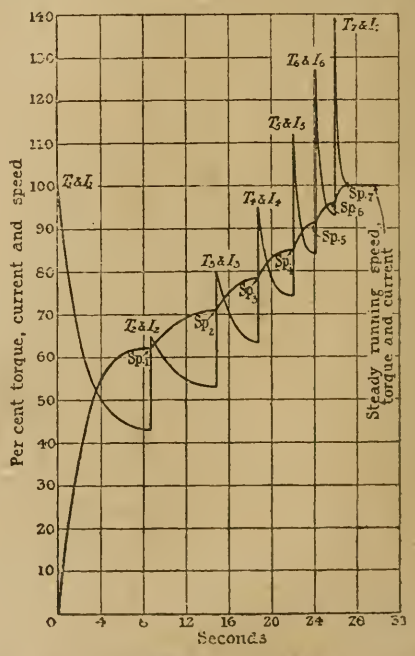

FIG. 2.—TORQUE/TIME AND SPEED/TIME CURVES FOR 7-NOTCH STARTER, PASSING 100 PER CENT. CURRENT ON FIRST NOTCH, WITH MOTOR HAVING CENTRIFUGAL-PUMP LOAD STARTING AT 7½ PER CENT. AND RISING TO 100 PER CENT. STORED ENERGY: 1 000 FT.-LB./B.H.P. MOTOR RESISTANCE: 8·8 PER CENT.

problem. The main requirement is ability to dissipate energy with a reasonable temperature-rise.

The temperature-rise, in continuous rating, obtained depends primarily on the watts dissipated per unit surface of the wire; the way the wire is shielded by the supports and frame; the proximity of one turn to another; the number of turns vertically above each other; the horizontal distance apart of the elements;

and the side draughts which are difficult to exclude while permitting free access of air. The slightest shielding or side draught causes the temperature to rise or fall erratically, yet the conditions existing in still air must be taken as the basis, for there is no alternative.

Curiously varying results are obtained with low and high final temperatures, owing to the different radiant components at the two temperatures, and quite different results are obtained if the element is horizontal instead of vertical, even when the total wire surface swept by the air is equal in both positions. The highest temperature-rise occurs at the middle of each element, whether

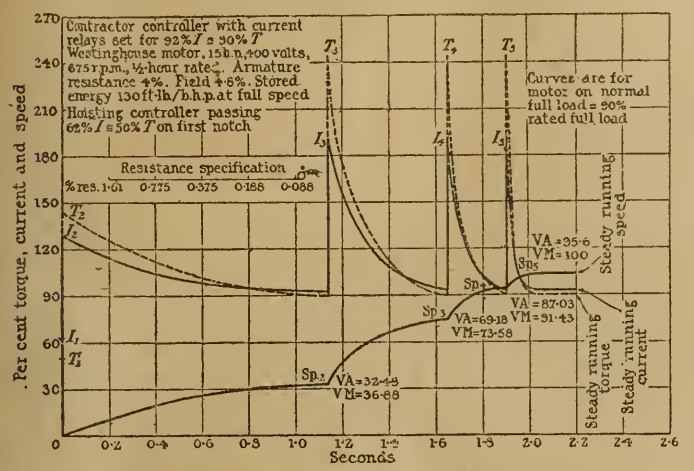

FIG. 3.

long or short. The temperature rise at the middle of the short element is roughly the same as that one-quarter the way up the longer one; the temperatures from element to element do not add up. The same sort of phenomenon occurs with elements immersed in oil. The temperature-rise observed at the top of the oil depends also on the head of oil above the elements.

Rating Difficulties.

There are thus numerous difficulties with continuous rating. Those with intermittent ratings are vastly greater, because if the heating is complex, the cooling is equally so, and heating for one short period with cooling for a different period makes the problem one of the most difficult that can be imagined.

It seems going rather far to have one type with low thermal capacity and high dissipating capacity for continuous rating, another with high thermal capacity and poor dissipating capacity for infrequent starting, and a third intermediate type for running on a consecutive cycle. The element already described is a satisfactory compromise; it dissipates heat readily because the spirals are scrubbed by the air or oil, yet it has a high thermal capacity because the spirals are in close contact with the stoneware.

One of the difficulties is that with shunt magnets the number of watts falls as the temperature rises, while with series windings the watts rise with the temperature.

The study of oil-immersed resistances is full of difficulties and perplexities, and yet starters are rated on the basis of watt-seconds, and the specific heat multiplied by the total weight of the oil. This might be correct if the whole of the oil were in intimate contact with the resistance element, but this is not possible in practical designs.

Fig. 4 shows a standard three-phase rotor starter with three elements, *i.e.*, one element per phase, and a series of brass pockets soldered into the side of the tank. Particulars are given of tests on such apparatus in the original Paper.

An interesting point to note is the lag of the temperature-rise after switching off.

Rating Resistances.

It seems best to rate resistances in the same way as motors and brake magnets, that is, by a definite temperature-rise in a definite time, and then to work out curves for cycles so that the capacity on any given cycle could be read off. The next step, after rating the resistances on a more or less rational basis, is to arrange the results in tabular form suitable for the salesman, and there again another difficulty arises. The currents corresponding to the standard d.c. motor horse-powers rarely agree with those which give the maximum permissible temperature-rise of the elements, so that, for the most part, the resistance units are running far below the maximum.

A table of horse-powers and resistance sizes correctly worked out presents the apparent paradox of the smaller horse-power frequently requiring the larger and more costly resistance; a correctly worked out table is practically impossible for alternating current slip-ring motors, because there are no standard full-load rotor currents. These currents vary enormously for the same horse-power from one motor maker to another, and from Continental to British practice.

One result of such low standard temperatures is that British gear is practically unsaleable on the Continent and in South America, and in pre-war days was very difficult to sell in the Overseas Dominions against German and American competition. The same remark applies to cable connections and switchgear generally. The waste of cable in connecting starters is sometimes grotesque; people apply the I.E.E. Wiring Rules, overlooking that these rules are based on an extremely conservative temperature-rise.

A.C. Starters.

The remarks on step-by-step starters apply generally to both alternating and direct current, but starters for alternating-current motors present certain problems peculiar to themselves. The resistances are generally connected in the rotors of slip-ring motors but they may be, and sometimes are, connected in both rotor and stator. They are connected in the stator of squirrel-cage motors. Resistances in the rotor may be cut out of each phase equally or unequally and may be either star or delta connected; the former is the more usual.

There is no correct number of notches for alternating-current starters, but the greater the number the better the performance of the starter or controller.

It is far more difficult for the user to appreciate the effect of increased notches and diminished out-of-balance rotor currents, because the rotor out-of-balance current is not shown as being out of balance on the stator ammeters, whether the stator is star or delta connected.

The rotor out-of-balance current may be so great that the motor is running as practically a single-phase rotor, but the stator currents are nearly balanced. This balancing transformer effect is so great

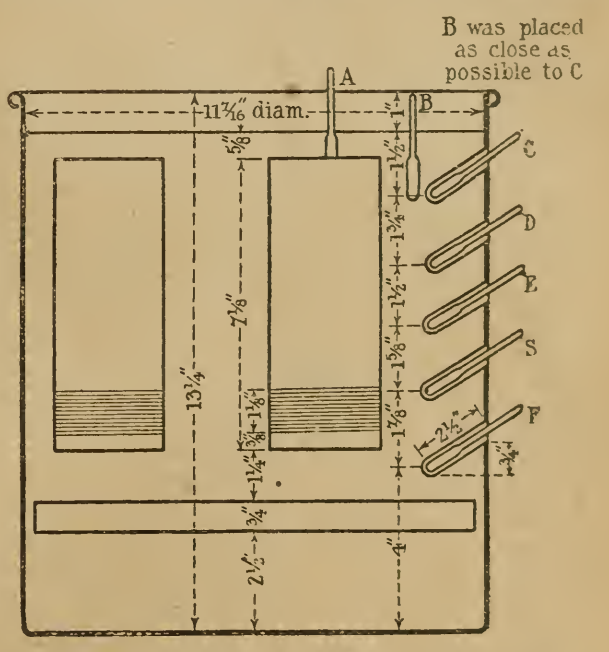

FIG. 4.—No. 1/1 OIL STARTER. 6 100 W PER PHASE. 30 SECS. "ON"; 7½ MINS. "OFF." 335 WATTS IN.² SURFACE OF WIRE. 1—68 TURN POT PER PHASE WOUND WITH TWELVE TURNS 16 S.W.G. "HECKRUM." TANK CAPACITY: 1 370 IN.³ GROSS, OR 103 IN. PER 1 IN. DEPTH. EACH POT 40·5 IN.³ (APPROX.), OR 5·69 IN.³ PER 1 IN. DEPTH.

Oil to top of pot ...	= 64·8 in.³	Oil E to S ...	= 140·0 in.³
,, Top of pot to C ...	= 75·1 in.³	,, S to F ...	= 169·5 in.³
C to D	= 150·2 in.³	Slate ...	= 77·5 in.³ (approx.)
D to E	= 129·0 in.³		

that even the rotor current-rushes on changing from notch to notch are averaged and represented in the stator by quite small swings.

There are probably many ways of calculating the notches and sections for unbalanced resistances, and the author has used several from time to time with more or less satisfactory results, but eventually an original method was developed, and this is described at length in the original Paper.

The Quebec Legislature have approved Bills promoted by the Montreal Tramways and Canadian Light and Power Company to purchase the power station of the National Hydro Electric Company at CARILLON (QUEBEC), with the right to sell electric power in 23 counties. The scheme will take four or five years to complete, and will cost between $30 000 000 and $40 000 000 for constructional work, plant, etc.

The Institution of Electrical Engineers.

At the meeting of the Institution on Thursday, March 2, Papers on "Electric Motor Starters," by Mr. J. Anderson, and on "Design of Liquid Rheostats," by Mr. W. Wilson, were read in abstract. Some notes on the "British Standard Specifications for Motor Starters," by Mr. C. H. Wordingham, were also read, and these specifications, together with the papers, were discussed conjointly. We publish, on another page, an abstract of Mr. Anderson's Paper. Mr. Wilson's Paper has already appeared in the Institution "Journal." Mr. Wordingham's notes are given in abstract below.

British Standard Specifications for Motor Starters.

By C. H. WORDINGHAM, C.B.E.

On the formation by the British Engineering Standards Association in 1914 of a committee under the chairmanship of the author, considerable difference of opinion was found to exist in regard to the distinction between a motor starter and a motor controller. It was finally agreed that the differentiation should be made on the basis of performance and not on construction, and the following definition of a motor starter was adopted:

The term "Motor Starter" denotes a device arranged for starting and accelerating a motor to normal speed, but not adapted for use in positions intermediate between the "off" position and the "full-on" position.

The term "starter" includes the following: (*a*) Rheostatic starters—(i) face-plate starters, (ii) drum starters, (iii) multiple switch starters, (iv) contactor starters, (v) liquid starters; (*b*) auto-transformer (compensator) starters; (*c*) switch starters for induction motors.

The corresponding definition of a motor controller is as follows:

A Controller is a device having several steps, contacts or positions, sometimes called notches, used with or without resistances, for regulating the speed of a motor or motors, and may or may not be used for starting. The term "Controller" does not include the resistances or other means of control employed therewith.

Simple shunt regulators are not included in this definition.

Face-Plate Rheostatic Starters.

A Specification for face-plate rheostatic starters was prepared and issued first. It was found necessary to discriminate between ordinary duty and heavy duty starters, the frequency of starting being the same in both, and the difference being in the starting periods. There was considerable discussion as to the starting periods before these points were settled, and the committee was greatly helped by Mr. G. H. Roberts, C.B.E., who dealt with the matter by the practical expedient of making trials on starters actually in use and known to behave satisfactorily under conditions of service. As a result of this investigation the objections which had been put forward were withdrawn.

Practically all specifications for motor starters prior to the work of the B.E.S.A. Committee included statements as to the number of contacts a starting switch should have, as well as the minimum resistance. Careful consideration, however, of the underlying theory of motor starting will show that the limitation of the current peaks as given in the specification provides all that is necessary in this respect.

Other Specifications.

On completion of the specification for face-plate starters the following specifications were commenced: Drum starters, liquid starters, switch starters, multiple switch starters, contactor starters, and auto-transformer (compensator) starters. These specifications are still in draft form.

Each draft specification is divided into four main parts, namely: (i) General definitions; (ii) rating, sizes and marking; (iii) design and construction; and (iv) tests. Mr. Scott Ram was consulted with regard to Home Office requirements, and he pointed out that as the degree of protection necessary for a motor starter to enable it to pass the requirements of the Home Office depended entirely upon the location of electrical apparatus, it was not possible to indicate in a specification whether a starter would or would not comply with the regulations of his Department.

The provision of an overload release on a standard starter has been made optional. It is recognised in the specification that motor circuits should be protected by independent fuses or overload safety devices, and that means should be provided, independent of the starter handle, for opening the main circuit of the motor.

DISCUSSION IN LONDON.

After the reading of the Papers, which occupied about an hour, the chairman, Mr. CAMPBELL SWINTON, asked a long list of speakers to be brief, and called up Major Gunton to open the discussion.

Major A. C. GUNTON said that Mr. Anderson's complaint of the scarcity of information available for the starter maker might possibly be met in future editions of the "British Standard Specifications." It had been found useful in other specifications to detail the information that should be supplied to the manufacturer, but care had to be taken not to encroach on the rights of the user nor to restrict the manufacturer in the evolution of new designs. In this particular series of specifications they were introducing clauses dealing with construction and testing and a way of making greater use of type tests was pointed out, though the principle of the type test could only be applied when the National Proving House was established. If the specifications were tried and made as full use of as possible, and the experience obtained embodied in representations to the B.E.S.A., the best way of improving the specifications would have been found.

Electrolyte Problems.

At the beginning of his remarks, Mr. J. M. L. SLATER dealt with the question of electrolytes. He had found washing soda to be the best, and though salt was useful when a low resistance was required it crept badly. Potash alum and potassium bichromate were also useful, colliery engineers preferring the former, as it gave steadier speeds during main and tail haulages. No allowance had been made in the rating calculations in the Paper for the variations in the form of starter; but in some the electrolyte was of different temperatures in different parts of the tank, and in others the whole of the liquid round the pots was heated uniformly. The only way of determining exactly what happened in large starters was to make a model and to discover the power absorbed per unit volume or weight of electrolyte.

No-Volt Release Troubles.

Mr. LLEWELYN FOSTER dealt mainly with the question of no-volt releases, saying it was not generally appreciated what troubles these gave on oil starters, whose operation depended on shunt coils which varied considerably with different makes of motors. When no-volt release coils failed the damage was not confined to the starter, but by causing inductive effects in the shunt coils it probably brought on a motor breakdown.

Ideals—Possible and Impossible.

Mr. J. T. MOULD said that the specification of standards for starters was obviously a compromise between the ideal and the practical. Before the panel started work each starter maker had his own standards with which it would have been unwise to interfere, so that what had to be done was not so much to evolve new standards as to co-ordinate those which existed in a form which would be accepted by everyone. The ideal of the user was often higher than that of the manufacturer, but it was not always possible to give the user all he wanted. In fact, it would not be good for him as the cost would be probably so tremendous that he would not be able to pay for it. A great point had been made of American standards, but some of the things the Americans allowed would hardly do over here, and, in fact, they had to choose between British reliability and American optimism. In the draft specification they claimed to have effected a reasonable compromise and to have laid a foundation on which others could build after apparatus produced according to the specification had been tried over a number of years.

Rating Methods Criticised.

Mr. T. CARTER made a number of criticisms of the rating methods followed in the specifications. If a motor to exert a 100 H.P. was required, a motor capable of giving 200 H.P. was not specified. Nor was it tested at half its rated output, but that was what clause 21 in specification No. 1.0 rather implied. A starter was capable of doing far more H.P.-min. than the specification permitted, and he suggested that there should be successive starts, but with long cooling periods between them. This would lead to the selection of a starter really suitable for the motor it was going to work with.

As it was, the B.E.S.A. tests set far too high a standard and would hinder development and restrict trade by making the starters too expensive. As regards temperature rise limits for conductor coils tests he had recently undertaken showed a wide difference in the temperature given when a thermometer and the rest of the resistance methods were used. The figures given in the specification were therefore confusing, and it would be better to be independent of the limit of 72 deg. and put in the correct figures from experiment. He did not think it was practical to give starting currents or full load currents for the motors, and there was also no need to mention efficiencies or power factors in the specification.

Electrostatics and Coils.

Mr. J. R. BLAIKIE said that the high peak shown in the middle of Mr. Anderson's curve probably had to do with the electrostatic state of the coils. In the case of series coils it was quite possible that the top one was nearer earth potential than the bottom one,

and the difference of temperature between the centre and the two ends was therefore considerably flattened out. The effect of dust on the flow of convection currents must also be taken into consideration, as this altered the rate of cooling. He would like to know whether Mr. Wilson was satisfied that the experiments on small apparatus, which he had conducted under a head of electrolyte, would be applicable to other types where a larger part of the action took place near the surface.

Mr. A. Dover called attention to the B.E.S.A. specifications in which the maximum peak of the current was specified. In that way, he said, with practical standards the whole of the resistance sections and the grading of a given rheostat could be expressed in terms of the percentage voltage drop in the motor at full load. Charts which he exhibited showed how the grading co-efficients for different conditions for given numbers of sections could be obtained.

Carbon as a Liquid.

Mr. H. Brazil said that Mr. Wilson's honesty with regard to the defects of liquid rheostats had led him to wonder whether it would not be better to use a material intermediate between solid and liquid, that was a solid broken up into powder. Experiments made on these lines had been perfectly successful, as the powder flowed as easily as liquid, and the resistance could be as easily regulated ; there was no trouble on direct current and the range of temperature possible was so much larger that a very much bigger rating could be allowed. While the space occupied by powder and liquid was practically the same it was possible to obtain 14·5 h.p. per lb. of powder as against 7 h.p. per lb. of liquid, the figure given by Mr. Wilson.

The Authors' Replies.

Mr. Anderson in reply, said that the conditions that starters and motors had to meet at starting were indefinite, and to attempt to set up standard rules to meet such indefinite conditions would be ridiculous. It would be better to give information to the starter maker so that he could intelligently supply a starter for the job. All that was needed in the standard specifications was an advance of the maximum temperature rise in certain classes of material. They could do the rest themselves.

Mr. Wilson, who also replied, said that his experience led him to consider ordinary washing soda as the best electrolyte. He had made no allowance for the variation of the temperature of the solution as it descended, but unless it was boiling he did not think it would interfere with the rating. He hoped that the specification was going to do a great deal of good, but if it did not go hand in hand with development it would mean stagnation. It was, therefore, a good thing that it was going to be revised every year. The rating formula was a very bad one and should be eliminated. He was aware of the discrepancy between his results and those in the text books, but he had repeated his tests and they came out the same every time. The difference seemed to be a matter of conditions. Mr. Brazil's suggestion with regard to the use of powder was well worth trying. His only doubt was as to contact, as there would be a possibility of arcing.

DISCUSSION AT NEWCASTLE.

Mr. Anderson's Paper was also discussed at Newcastle, and we give below an account of the various speakers' remarks.

Mr. J. Schuil pointed out that the practice of installing blow-out coils connected across the mains had the advantage of maintaining the field constant, and that further advantages could be obtained by the distributed effect of using several small blow-out coils instead of one large one. A series hold-on coil could also be utilised as a combined blow-out coil and no-volt release.

The Importance of Contact Design.

Mr. T. Carter considered that liquid starters were on the whole more useful for alternating than direct current working, but the development of the d.c. liquid starter was a matter of importance. Liquid starters he regarded as sound and satisfactory apparatus ; where troubles were encountered they were usually due to particularly bad treatment. An advantage of the liquid starter over the resistance starter was the ease with which it could be seen if anything was going wrong. In the case of resistance starters too much importance could not be attached to the type, condition and shape of the contacts, as the slight roughening which was likely to occur under operating conditions would rapidly upset all test bed data.

Mr. G. Mallinson said that the user frequently saw defects which the designers had never thought of, and mentioned that although a starter might give satisfaction in a power station, the same starter would probably be the cause of heavy maintenance charges if used in a plater's shop. For shipyard work starters required to be particularly robust. If cast-iron resistance grids were used it was necessary to employ the proper grade of cast iron. He advocated a definite stop in the off position for barrel controllers on d.c. cranes in order to prevent the operator moving his handle straight over to the reverse position. Enamelled wire resistances were variable, and he instanced a case of a wire resistance wound on a tube, covered with clay and subsequently baked, which gave a speed variation of 50 per cent. on inching, according to the day, the resistance being affected by the amount of moisture in the atmosphere.

Mr. J. Gibbins found the reluctance of motor manufacturers in giving the needful information to the starter makers to be increasing, and often the information could not be obtained until the motor was on the site. Starting switchgear was often regarded as a side-line, which was a great mistake. The importance of suitable switchgear could not be over-emphasised, as it was a sound investment and was a form of insurance.

Mr. A. P. Pyne emphasised the necessity for the development of push button control, as labour became continually more rough. He was confident that the use of contactors could solve all control problems if the contactors were properly designed for the job.

DISCUSSION AT BIRMINGHAM.

In the discussion on Mr. Wilson's Paper at Birmingham, Mr. J. Anderson said the liquid starter was ideal, theoretically, because the desired accelerating torque could be obtained with the minimum current from the line, but in practice the ideal was far from being realised. The author referred to the iniquities of the standard specifications, and rightly so. As regards temperature rise, "Why not let the stuff boil ?" generate and condense steam and work under pressure at temperatures of 300°F. to 400°F. It was a criminal waste of material to try to dissipate energy at 100°F. rise, and to throw away the possibility of utilising the latent heat of steam in short-rated starters.

Importance of Electrolytic Action.

Mr. H. C. Fox said that the tests did not establish that with alternating current of any periodicity electrolytic action was negligible. The point was of importance when the rheostat was in series with the rotor circuit of a lightly loaded induction motor. Here the frequency was of the order of 1 or 2 cycles per sec. unless the resistance value was very high, and in such circumstances a certain amount of electrolytic action might be anticipated as d.c. conditions are being approached.

Mr. C. Sutton said that a sound Paper on the design of liquid rheostats had been long overdue and this Paper would have served a very useful purpose if it convinced users that the liquid rheostat was a permanent article instead of only being of use in a test room.

Mr. B. A. M. Boyce asked whether there had been any difficulty with high voltage between electrodes just before they were short circuited.

Plain Water.

Prof. Cramp said that the deductions which the author made from his experiments would be rendered much more clear if he would add for each experiment the analysis of the electrolyte. He had referred to the use of "plain water." This was a very hazy term. Throughout the Paper the basis for the calculation of the surface densities was unsatisfactory, for the protection of the backs of the plates with insulation did not mean that there would be no current therefrom.

Islington's Electric Vehicles.

The cleansing superintendent of Islington Borough Council (Mr H. F. Wigfield) has published interesting figures of the comparative cost of collecting house refuse by electric vehicles and horse vans. The cost was 15s. 7d. and 17s. 4d. per ton for horse traction and electric vehicles respectively. The advisability of substituting motors for horse traction depended on local conditions, but there was no doubt that it was a forward movement to employ electric vehicles for dust collection, and this method would be pretty universal in the near future. He found that less outside supervision was required for this class of vehicle than for horse-drawn vehicles. Those who were seriously thinking of adopting electric traction should go fully into local conditions as to electricity supply. In the metropolitan area no two places were exactly alike in their charges, which ran between 1d. per unit at Woolwich to 2½d. in Islington. If direct current was not available large sums would be required for converting plant.

Mr. Wigfield states that allowance must also be made for the fact that the running of the plant would consume as much electricity as the vehicles themselves ; consequently there was a big initial outlay, and large sums were required for depreciation, interest on capital, and a bill for practically three units of electricity for every mile run. Manufacturers of electrical vehicles and users in some places would say that the usual consumption was about 1½ units per running mile, but that only applied when direct current was available. If local authorities and electrical engineers would only get a move on and provide a direct current supply, so that all electric vehicles could be supplied from a charging panel and plug only, without the need of converting plant, more than 50 per cent. of the present cost of charging vehicles would be saved, electric vehicles would be used more generally, and an enormous revenue would accrue to the electric supply undertakings.

Rotary Converters, with Special Reference to Railway Electrification.

We give below an account of the discussions which took place in London and Newcastle on the Paper recently read before the Institution of Electrical Engineers by Mr. F. P. Whitaker on "Rotary Converters, with Special Reference to Railway Electrification." An abstract of the Paper appeared on p. 258 of our issue of March 3.

DISCUSSION IN LONDON.

Mr. Roger T. Smith prefaced his remarks by saying that it was an opportune time to discuss rotary converters for railway purposes. Continuing, he remarked that short circuits would probably always occur in railway work, and it was therefore more important to secure converting apparatus that would withstand them without interfering with the traffic rather than to work for slightly better efficiencies. The d.c. part of the rotary converter was never intended as a generator, though on short circuit it became one and played its part very badly. With all its faults, the cheap cost and high efficiency of the rotary converter on low frequencies made it very attractive, but the space required by the transformers and by two machines in series necessary to get 1 500 V d.c. on a 50 cycle supply was a disadvantage. As nearly all the capital stations would be using a frequency of 50, the employment of motor converters, of synchronous motor generators, or of mercury arc rectifiers must therefore be considered. His own sixteen years' experience with 600 V motor converters had been entirely satisfactory, and he thought the machine would be equally satisfactory on 1 500 V with an a.c. supply at 11 000 V. In addition, such machines with 50 periods were much cheaper and as good as, if not better than, on 25 periods. They were stable on short circuit, and after short circuit came up excited in the right way. Their annual efficiency of output to input was as good as that of the rotary converter, although on isolated tests the latter might show figures 3 or 4 per cent. higher.

Criticism of the Rectifier.

Mr. J. R. Cowie supported the use of the synchronous machine or the La Cour converter in preference to the rotary, at any rate on 3 000 V circuits. He considered, however, that the mercury arc rectifier, in spite of its attractiveness in theory, required a good many mechanical improvements before it could be satisfactorily used on traction circuits. The maximum short-circuit current of 14 000 A given by the author could be kept down to 6 000 A by the use of high-speed diverter switchgear, and the maximum peak could be reached in less than half the time given by the author. One of the things omitted from the Paper were slip ring difficulties. Personally, he had not found a satisfactory a.c. slip ring brush. The dust from the wire brushes powdered the whole of the windings and this, when a short came on, rose up in a cloud.

Experiences with H.-T. Rotaries.

Col. H. E. O'Brien said that at first they had a good deal of trouble with the 1 250 V, 25 cycle rotary-converters used on the Lancashire and Yorkshire Railway, which were designed about 1915, but when they removed the compounding not much further trouble had been experienced. Were it not for the batteries installed, however, the interruptions to traffic would probably have been serious, and Mr. Whitaker therefore deserved a good deal of gratitude for indicating methods by which rotary troubles could be prevented. The flash-overs they had experienced were not very serious, being generally confined to a particular pair of brushes, and the brush gear, which had been working since 1916, was only now beginning to show signs of heavy wear. The suggested improvements in 1 500 V rotary converters would enable them to increase the load factor of the sub-stations. The rotary converter had a rival in the mercury arc rectifier, which functioned well on very fluctuating loads, though it had the grave disadvantage that it was no use for sudden increases in load, as it required from 20 to 25 min. for warming up.

Reliability Rather than Efficiency.

Mr. G. A. Juhlin said that reliability rather than efficiency should have taken first place in the author's schedule. The limit of 13 V per bar for 50-cycle machines was rather low, as there were hundreds of thousands of kilowatts of 50 and 60-cycle plant operating at 15 or 16 V per bar, and there were machines in London with bars not more than 0·14 in. in thickness. In regard to commutator speeds, Mr. Whitaker erred on the other side. He doubted whether there were any machines other than d.c. turbo-generators which ran at 8 000 ft. per min., though by the use of a radial commutator a higher speed than that could be safely obtained. Machines with radial commutators were already operating without difficulty at speeds up to 11 000 ft. per min. If, therefore, 15 V per bar with a speed of 9 000 ft. per min., and a thickness of commutator bar of 0·175 were taken as criteria there should be no difficulty in producing a 1 500 V 50-cycle rotary converter. For 3 000 V it would still be necessary to use two machines in series or to employ synchronous motor-generator sets. The direct-current side could be protected from flash-overs by short-circuiting the machines across three slip rings on the shaft. These slip rings were put in circuit by an automatic switch as soon as a heavy overload occurred. He showed a slide illustrating a set operating under these conditions and carrying seven-and-a-half times normal load, in which brush flashing was only just discernible. The time lag on the "suppressor" was 0·005 sec., and the current rose to about ten times the normal before it acted. With this method the voltage was taken off the machine, and, although the current rose rapidly, there was no flash-over on the machine itself.

Will History Repeat Itself?

Dr. S. P. Smith said that the author catalogued numerous difficulties, but did not indicate the way in which they could be overcome. Every designer tried to keep the pressure between the segments as low as possible, but they would have gradually to approach whatever the possible limit was, and it was no good trying to keep down to a figure of 13 V on the highest frequency, especially as satisfactory machines had been built with 20 V between the segments. The thickness of the mica was also an important point. Machines had been built with bars as narrow as 3 mm. with 1½ mm. of mica between them. Possibly when all these improvements had been made the same thing would happen to the rotary converter as had happened to the direct current generator, which, directly it could be satisfactorily built, had been ousted by the rotary converter. Now the rotary might in its turn be ousted by the mercury rectifier. Col. O'Brien said that his machines had been better since he had cut out the compound winding. They would probably have been equally successful had he reversed the compound winding, as the great thing was to bring down the voltage and keep the current from rising above the normal value.

Uneconomic Overload Ratings.

Mr. P. R. Wray said that with rotary converters the overload capacity was a most important consideration. Enormous sums were spent in providing overload ratings which were never used. Where a number of sub-stations fed into a common system, as was usual in railway working, there was no justification for sustained overload ratings.

Complications v. Simplicity.

Mr. W. E. Highfield said that it was extraordinary how many enemies the rotary converter had and yet how many of them were used. Two or three years ago the question of rotary design was fully ventilated in America, and the causes of the short-circuits were isolated, but the resulting design was decadent and retrograde, as the spaces between the brush arms were filled up with flash guards, wire netting, and other devices which defeated the object for which they were designed. Insulation used in this way carbonised after a time and damaged the commutator, while the machine was so completely masked that it could not be readily cleaned or inspected, Mr. Whitaker's design, though a great improvement in these respects, had the disadvantage that it was very conservative. He had built machines with air-insulated commutators which ran at an average pressure of 90 V per bar and showed no flash-overs. Commutator speed was a question of the design of the brush holder. He had seen brush holders that ran at 10 000 ft. per min., and others which would not run at 3 000 ft. per min.

A Single-Phase Advocate.

Major A. M. Taylor said that 1 500 V was by far too small a voltage for main-line electrification. Between Birmingham and London fifteen main-line trains ran each way during twelve hours. At 45 miles an hour that gave a 36-mile headway. Dividing the lines into three sections there would be in each section two trains, one going each way. With 6-mile sections, and with trains taking 1 000 h.p. each, eighteen rotary converter sub-stations would be required. This would necessitate a tremendous capital outlay which could be avoided with single-phase working, especially if the trolley voltage were raised to 15 000 V with transformers on the locomotives, for the sub-stations could then be 20 miles apart. With the eighteen rotary converter sub-stations there would be a large amount of running at zero efficiency unless automatic devices were used.

The Designer's Point of View.

Mr. R. Jakeman said, fitting a fan to blow out the arcs seemed rather primitive. He preferred a magnetic blow-out arrangement. A high-speed circuit-breaker described in an American paper some years ago was said to have a spring compressed to 8 000 lb. pressure, which was released by a plunger in 0·001 sec. This seemed hardly possible. While it was true, as the author said, that rotary converters were not much larger than motor generators the increased

amount of insulation with which the conductors were wrapped prevented the heat being got rid of so quickly, and the current densities had therefore to be kept lower. It was not necessary to supply the two rotaries in series as shown by the author with two separate secondaries on the transformer. Harm from tooth ripples could be decreased by keeping the number of slots as large as possible so that the tooth ripple was above the ordinary speed ripple on the telephone. The mean air gap should also be made large, but these two things resulted in a larger machine.

Rotaries and Telephones.

Mr. S. C. Bartholomew discussed the paper from the telephone engineer's point of view, and said that the old idea that direct current traction was not harmful to the telephone had had to be changed in recent years. He was, therefore, pleased to find that Mr. Whitaker could produce such insignificant ripples on direct current circuits. Unfortunately the rotary gave a ripple of between 900 and 1 100 per sec., a range which had the greatest effect on speech, while the fact that they were used on an unbalanced power circuit with an uninsulated return also had serious consequences. Those engaged in power supply often overlooked the fact that a telephone circuit was effected by a very few microwatts, and that the effect was cumulative If the ripples could be reduced to 1 or 2 per cent. there was little fear of interference with the Post-office circuits.

The Author's Reply.

Mr. F. P. Whitaker, in replying to the discussion, exhibited a slide of a 1 000 kW, 500 revs. per min., 1 500 V machine which was to be employed on the Victoria Railways. This would stand three times the full load for 20 sec., and when from seven to eight times full load current was thrown on the machine there was only a small amount of arcing if a high-speed circuit-breaker were employed. With a low-speed circuit-breaker there was rather more arcing. Turning to the discussion in detail, he said that for railway work rotaries were the most economical machines to employ, because any high-tension voltage could be handled without transformers. Whether electrification was accomplished by means of motor generators or rotary converters, the flashing problem had still to be solved. A good machine could not be made out of a bad one by the introduction of a high-speed breaker, but if the vapour present were reduced the flashover was also reduced, and that was what the high-speed circuit-breaker permitted. If the slip rings were well spaced there was no need for special protection. With regard to Col. O'Brien's remarks, the more heavily a machine was damped the more easily would it take the full field excitation. To obtain 1 500 V from a single armature meant encroaching on the margins of safety, and at present it had not been proved that there was the same factor of safety with a single as with a double armature. The same applied to the voltage per bar. In this connection spontaneous flashing was the most serious, and the higher the voltage between the bars the nearer the spontaneous flash point was approached. Mercury arc rectifiers eliminated many of the good properties of the rotary converter—a machine which already had practically unity power factor. There was, besides, no ready means of compounding rectifiers, and the train equipment, therefore, had to work over a bigger voltage range than it would if constant voltage could be maintained.

DISCUSSION IN NEWCASTLE

Prof. W. M. Thornton remarked that the cause of flashovers was originally thought to be a rise in voltage, but it was later ascertained that they were actually due to a fall in resistance. The question then arose as to whether the fall of resistance was due to the presence of copper vapour or carbon dust. It had since been traced and confirmed by experience that it was due to the presence of carbon dust, compared with which the conductivity of copper vapour was low. The presence of such dust would obviously lower the resistance of the surrounding air and render a flashover more likely. The practice of fitting wipers on the surface of the commutator immediately behind the brushes had invariably been found effective in preventing flashovers; this confirmed that flashovers were due to the presence of dust or solid particles, which could be collected, as such wipers would not be able to collect or remove vapour.

Rotaries for Automatic Sub-stations.

Mr. W. T. Dalton considered the improved designs of rotary converters, which after a flashover would be able to start up again without damage to the commutator or brush gear, would be eminently suitable for automatic sub-stations where no attendance was provided. Unless such machines were used there would be a danger of a machine being started up in a damaged condition. In order to provide for regenerative braking it would be necessary to reverse the series winding; on a rotary converter he thought it was improbable that this would be done. The question of telephone interference was very important, and although some telephone systems were more sensitive than others, railways were generally in a more favourable position than tramways in this respect due to the rails being insulated from earth.

The Author's Cautiousness.

Mr. F. T. Townend thought the limits of voltage per bar and peripheral speed given in the Paper to be on the safe side. To increase the d.c. voltage obtainable it was necessary to increase the peripheral speed, with an axial commutator it was not desirable to exceed 8 000 ft. per min., but if a radial type commutator be adopted the speed could be increased considerably and might be the means of obtaining 1 500 V on a single unit machine at 50 periods. In addition a radial commutator was much more simple. He also considered an air draught due to an axial fan to be far more effective than any magnetic blow-out for blowing the arc off the commutator. He gave a description of the "Storer" arc suppressor which had proved satisfactory in the prevention of flashovers. To intercept the short circuit on the d.c. breaker took time, and before the breaker could operate a flashover on the machine occurred. It took much less time to close a circuit than to open one and the suppressor, working on this principle, short circuited the slip rings in 0·006 sec., thereby killing the voltage on the armature before the d.c. flashover could occur. The field circuit was also interrupted. Slides were shown of a short circuit on a machine with and without the suppressor, from which it was obvious that when the suppressor was used no damage to the machine occurred. These suppressors were exceedingly useful on motor generators. But not to be used on rotary converters owing to the fact that they would pull the machine out and it would have to be started up afresh.

Mr. C. Sykes described some recent short circuit tests on a 1 500 kW rotary converter which he had witnessed, in conjunction with which high speed circuit breakers were used. He was impressed by the absence of any sign of burning on the commutator or brushes after thirty-seven short circuits had been applied.

Commutator Wear.

Mr. J. R. Beard gave some interesting figures regarding the wear of commutators. On railway machines the commutators frequently had to be cleaned up and considerable wear would be expected. It had been found that in seventeen years service only ¼ in. of wear had resulted, which was equivalent to sixty-eight years per in., a very reassuring figure. The Newport-Shildon rotary converters, operating on 1 200 kW were very satisfactory in clearing short circuits on the d.c. side, continuing to run and being ready to resume load when the d.c. breaker was again closed up.

Mr. H. B. Joynder added that only three times in the life of the machine referred to by Mr. Beard had the d.c. circuit breaker opened on short circuit and on each occasion this was due to the breaker being out of adjustment. Experience with the rotaries at Ayecliffe showed that all the flashovers were to the bedplate or to the pedestal, *i.e.* to earth. In this connection it was found that a coating of paint was quite a large deterrent, apparently due to the resistance being considerably increased. When a circuit breaker opened on overload a flashover frequently followed, and he thought that the requirements were not so much a high speed circuit breaker as a circuit breaker which had a high speed of opening, but finished its movement slowly.

The Use of Diverters.

Mr. H. W. Clothier suggested a high speed diverter switch should be utilised to protect a rotary converter where the conditions were severe, the diverter switch limiting the duration of the short circuit by inserting resistance in the circuit. When the current reached three times its normal value the diverter switch would operate and insert the resistance within 0·3 sec., so limiting the current until the ordinary circuit breaker of a deliberately slow break type had time to operate. It was undesirable to allow high tension switches to operate when a d.c. short circuit occurred, the duration of the short circuit should be limited without interfering with independent switches, thus leaving the machine ready to take up load again.

Mr. J. Rosen, said the flashover problems with rotary converters were similar to the problems encountered in the days of d.c. generators, where compensating windings were found very useful.

Mr. P. F. Allen believed that the experimental results with increased speed and radial ventilation of rotary converters had shown a reduction in the liability to flashover, and in the damage done to the machine.

The Author's Reply.

Mr. F. P. Whitaker in reply, emphasised that the important point was to get the flashover arc off the commutator. Rotary converters had been installed for regenerative breaking, being fitted with a special form of contactor gear to provide for the reversal of the series winding The addition of flash barriers to a machine was not desirable as they simply added to the maintenance. He agreed that the short circuit current should be limited as quickly as possible in order to reduce the quantity of conducting vapour produced, but the final break should not be rapid. The fastest circuit breaker he had seen limited the current in the circuit in 0·005 sec., but it was doubtful whether it would be possible to guarantee that the current would be limited on a 50 or 60 cycle circuit. To instal reactance in the d.c. circuit was not commercially feasible

The Home Idealised.

(*Continued from page* 321.)

"Sun"-ny Domesticity.

An excellent array of labour-saving appliances is to be found on the stand of the SUN ELECTRIC COMPANY, which is divided into two main portions, one of which is arranged as a modern kitchen, and the other as an imposing dining room. In the former are to be found in working order the A B C electric laundress, types of the "super-electric" washer and wringer, one of which is of aluminium

FIG. 7.—VIEW ON THE SUN ELECTRICAL COMPANY'S STAND.

with 12-in. rollers. These rollers swing in a complete circle round the base and automatically lock rigidly in any one of twenty positions. Then there is the oscillating electric washer and wringer in which the tub is given an effective oscillatory motion, so ensuring thoroughly clean work in the shortest time possible. While it may be said that the dolly electric washer and wringer, which is also on view, is pre-eminent because of the care taken in its construction and the high grade materials used. It is interesting to note that no gears or motors are attached to the tub, all of them being fitted to the underneath framing. The dolly is self-locking and takes up the correct position for washing irrespective of the clothes placed in the tub.

Dish Washing Revolutionised.

Next there is the Holiday electric dish washer—a piece of apparatus most aptly named. This is an automatic appliance which, we are told, will handle the average six-piece dinner-service comfortably at one loading, and really does wash the dirtiest dishes in three minutes, which is, after all, what a washer is for. Not only does it wash the dishes, but it also rinses them and dries them before ejecting them, so that the harassed housewife contemplating this piece of apparatus will almost be persuaded that the millennium has come.

Lastly in this section is to be found the "Reco" kitchen table unit, which is a kitchen table equipped with an electric motor, connected to a gear-box and couplings of patented construction. With this simple and ingenious piece of apparatus the housewife can make cakes, beat eggs, whip cream, mash potatoes, drive food choppers, sharpen cutlery, clean silver, and, in fact, do almost every domestic operation except dress and undress the baby.

"Sunco" Fires.

In the dining-room section are Sunshine electric cleaners and representative models of Sunco electric fires. Among the latter we specially noted one of Tudor design with an armoured bright finish, which is placed in a fire grate in the position usually occupied by coal fires, principally, so the Sun Company tell us, because a good many people in their conservatism still prefer to sit round a fire instead of on it. A view on this part of the Sun stand is given in Fig. 7

Wireless in the Ideal Home.

No home is ideal without its wireless equipment. At least, this is the opinion of the BRITISH THOMSON-HOUSTON COMPANY, who are showing in working order their portable wireless receiving set. This, though not actually designed for the purpose, is admirably adapted for home use, as it is simple and by means of three easy adjustments can be employed to pick up signals from all sorts of interesting stations. We gave some details of this equipment in our account of the Shipping and Machinery Exhibition last autumn, but it may be added that the equipment is contained in a highly-finished cabinet which is as artistic a piece of drawing-room furniture as any gramophone. The set requires no aerial or earth wires, and has a range of reception from 300 to 20 000 metres. It can be used as a direction finder, and wave meter, and, becoming more technical for the moment, can also be employed to locate an earth on a.c. or d.c. cables. If, moreover, an aerial can be begged, borrowed or stolen and connected to the terminals fitted on the set wireless concerts and wireless telephone conversations can be excellently received.

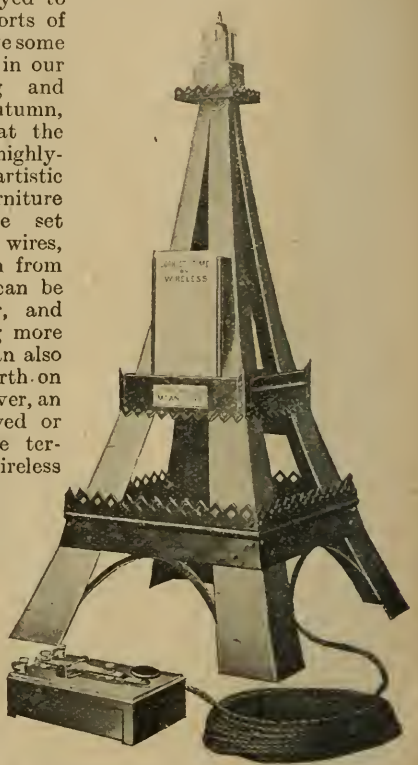

FIG. 8.—B. T.-H. WIRELESS TIME INDICATOR.

In these days when time is money a wireless flashing device which is also exhibited is of interest. This allows the wireless time check from the Eiffel Tower or other stations to be flashed in plain figures to the public four times daily. This time is guaranteed to 1/100th of a second. For spectacular purposes in the shop window this device may be made up in the form of a small Eiffel Tower, as shown in Fig. 8, while more suited for outdoor indications is the large box-form illustrated in Fig. 9.

Another exhibit is a small motor generator with a range of output from 50 to 150 W. This can be connected to a lighting circuit or driven separately by a belt for wireless transmission purposes or for charging accumulators, while, as it is readily portable, it can be put to a variety of other uses which need not be detailed.

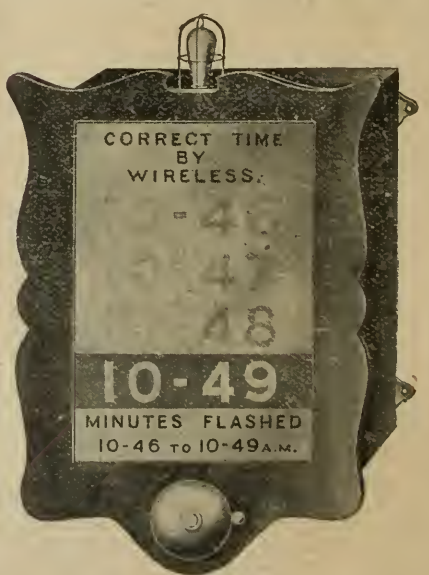

FIG. 9.—ANOTHER TIME INDICATOR FOR OUTDOOR WORK.

It may be pointed out that a successful demonstration of wireless telephony and music which are being given by the British Thomson-Houston Company at the exhibition has not been achieved without difficulty, as Olympia is be-sprinkled with steel structures whose screening effect is pretty noticeable.

"Universal" Labour Saving.

The stand of L. G. HAWKINS COMPANY is crowded with Universal domestic labour-saving appliances, ranging from washing machines to electric kettles through a variety of stages. The various features of these appliances are so well known as not to require any further description, though special attention may be called to the lighting standards shown. These include a Georgian

pedestal candle fitting and canopy shade in one, which carries two metal filament lamps, and by the colouring provided gives a soft mellow light which is most pleasing and comforting. The same idea is applied to pendants. In all cases the lamps are controlled by switches in the lamp-holders, which are operated by positively pulling a chain. A view of one of these lamps is given in Fig. 10.

Needless to say the "Universal" electric washer also finds a place in full working order, and it will be remembered with some interest that the motor of this is so arranged to cut out on overload. A reciprocating motion is given to the drum containing the clothes by means of a cam device. A modification in the "Universal" toasters consists of a special carrier for the piece of bread undergoing the operation. This works on a reciprocating-reversible principle, so that the toast can be turned round without being touched by the hand. This is not only an advantage from hygienic reasons, but prevents burnt fingers, loss of temper, and deposition of the toast on the floor.

We were also shown a new iron whose special feature is its round heels, which prevent the material rucking up when the iron is brought back. The Wallis adjustable bed rail lamp, too, is an exceedingly compact piece of apparatus, which should not only

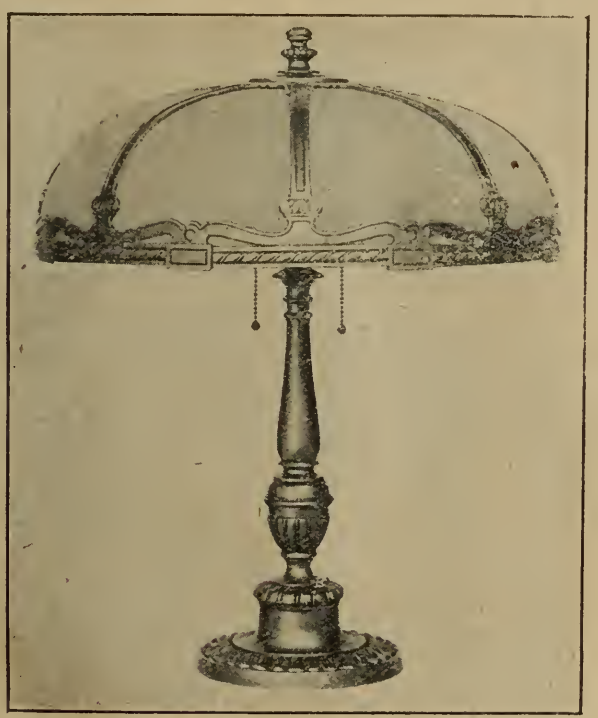

Fig. 10.—A Tasteful Fitting on L. G. Hawkins & Company's Stand.

be in the possession of all those who follow the pernicious habit of reading in bed, but is equally useful for placing on the piano, for excursions by night into the wine cellar, if any, or for employment in any place where it is necessary to have a portable light and at the same time desirable to put it down when both hands are required for some other operation. This lamp will stand and hang anywhere, has the further advantage that it takes to pieces very easily and packs up into a very small space. Then there is the 40 W bed warmer, which contains three heats operated by a most ingenious push switch with an indicator, all so small as to be almost a watchmaker's job. The plunger, which is operated by the thumb, is cut with spiral grooves, which give it a rotary motion round the various contacts when pressed. In decorating the stand considerable use has been made of Hawkins' colours of yellow and gold, and the general effect is very pleasing.

The Olipel Heater.

Mr. Herbert Hogg is showing the Olipel water-heater, which is an electrical means of obtaining hot water without any further difficulty than connecting an adaptor or a wall plug to the electricity supply main. The heater itself is constructed of nickel-plated copper heavily tinned on the inside and weighs 6½ lb. It has no complications to get out of order, and it consumes only 0·75 kW h in twenty-four hours.

The Birmingham Guild, Ltd., have an artistic display of all types of metal fittings for the home. These of course include electric light fittings, of many pleasing designs and efficient execution.

(To be concluded.)

Correspondence.

MECHANICAL AND ELECTRICAL EFFECTS OF LARGE CURRENTS ON H.T. SWITCHGEAR.

To the Editor of THE ELECTRICIAN.

Sir.—In your issue of February 17th there appeared a letter from the Metropolitan Vickers Electrical Company, commenting upon my notes on the above subject contained in your January 20th number. Absence abroad has prevented my giving attention to this before. The switch mechanism illustrated by the Metropolitan Vickers Company contains many excellent features, although I assume, seeing that it embodies a wooden operating rod, which is a type of design now abandoned by modern designers, it is shown mainly for its historical interest. The shape of the brushes, however, is certainly in accordance with the principles laid down by Mr. Torchio as a result of his experiments.

In my opinion, however, nothing can compare for efficiency in oil switch contacts with the controller finger form. For one thing such contacts are very much easier and cheaper to renew than are brushes. I do not think any designer would use a brush form of contact for high tension oil switches unless he is forced to do so by reasons of lack of space to accommodate the finger type.

Many American designs of oil switches in the past have utilised relatively very small oil tanks and it is easy to see why brush contacts have been used with these tanks to such a large extent. The British practice, however, of using very much larger oil tanks is, in my judgment, the better one.

With reference to the statement that the finger contacts shown in my Fig. 3B can "freeze" together, this is quite impossible. "Freezing" only occurs between contacts when an electric arc plays between the contacts. As the two fingers in Fig. 3B however, are always at the same potential there is no possibility of an arc occurring between them.

I quite agree as to the desirability of keeping the resistance of the arcing path as low as possible as compared with that of the main contact path.—I am, &c.

Sutton Coldfield, March 20, 1922. Charles C. Garrard.

The Silvanus Thompson Memorial Lecture.

The fifth Silvanus Thompson Memorial Lecture was delivered before the Rontgen Society on Tuesday, March 21, by Sir Oliver Lodge, the subject being "Magnetism—and the Ether." The first part of the lecture was devoted to an appreciation of the late Prof. Silvanus Thompson, who was first President of the Rontgen Society. Sir Oliver referred at some length to the high qualities of Prof. Thompson, and summed him up by the remark that he was a good friend in every sense of the word.

The Nature of Magnetism.

After mentioning the work of pioneers in radio-activity and its application to medicine, Sir Oliver considered the problem of magnetism and the ether. We could not generate magnetism, or electricity, or matter; but could only set it in motion or re-arrange it. Many still thought that they could generate magnetism, and certainly they could make any number of magnets, but always by the aid of an initial magnet; the specific germ of life had to pre-exist. He admitted that an electric current could be generated by the process of setting an electron in motion, but the evidence went to show that the magnetism which accompanied an electric current was something pre-existing in the ether, and was not called into being out of nothing. Heat, light and sound were forms of energy, but magnetism was no more a form of energy than was electricity or life.

Magnetism and Current Inseparable.

Dealing with the ether, Sir Oliver said that matter was not necessary for a magnetic field. Iron and other magnetic substances had a large number of magnetic loops in their own constitution, so that when these were opened out they added themselves to the loops which existed independently of matter and thus produced a stronger field for a given magneto-motive force. But such extra loops were not essential, for nothing had yet shown that an equally strong magnetic field could not be produced in empty space, that is, in the ether, if a sufficiently strong current were available. Sir Oliver then went on to discuss the prodigious intensity of the circular fields surrounding the equator of a rapidly moving electron, besides which there were the loops which could be opened out in the process of magnetisation, but even when opened out the loops remained perfectly closed curves, passing through the core of the magnet and never terminating on its surface. An electric current was also continuous and circuital, but when the current stopped, the portion inside a conductor ceased to be. Magnetic lines were always closed complete curves. A magnetic loop and a current loop were always linked together, and one seemed to be just like the other, but the difference was that the current circuit could be cut, and when the current stopped the circulation stopped dead.

leaving, if any residue at all, an electrostatic field between the cut ends. But the magnetic loop behaved differently. When the generating current strengthened it expanded, when it weakened it contracted, and when it stopped the magnetic loop shrank so that it enclosed only an infinitesimal area. The amperian circuits remained, and though they existed in matter, they existed also in empty space, so that magnetism was an affair of the ether.

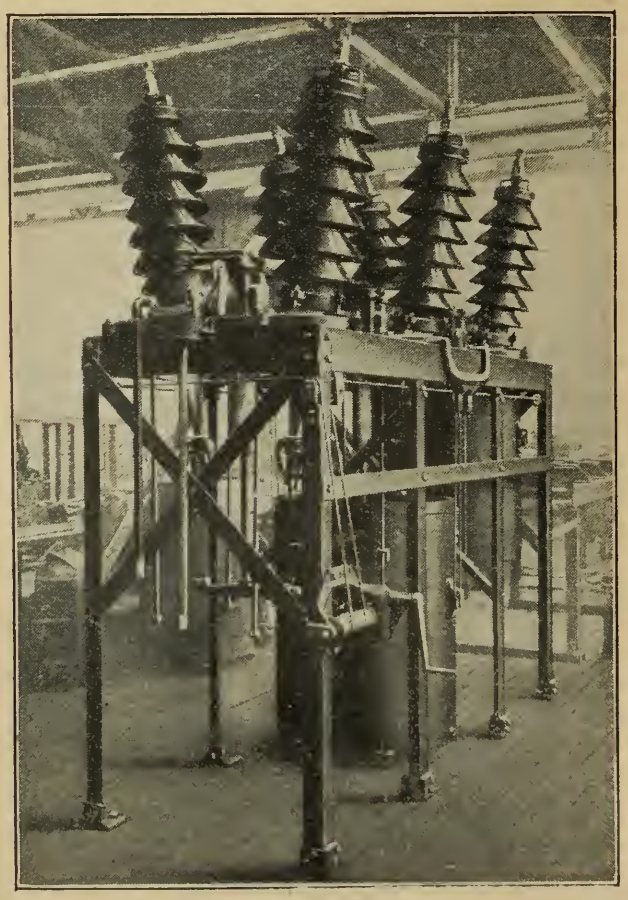
Magnetic Circulation.

As to possible circulation, there was an obvious possibility that something was circulating round a circuit always closed. The working hypothesis was that there was a slow etherical circulation or flow along the lines in a magnetic field, the flow being in orbits of considerable size, so that a beam of light might be sent along against the flow, and a measurement made to see whether the light was accelerated or retarded. It was becoming customary in a few quarters to doubt the existence of the ether of space, and to suppose that Einstein had exploded it. That was contrary to the truth, and, so far as Sir Oliver knew, no great authority on relativity really supposed that. Certainly Einstein himself did not. On the contrary, his discovery, linking gravitation with light for the first time, strengthened the position of the ether.

High Voltage Outdoor Switchgear.

The Metropolitan-Vickers Electrical Company have shown their belief in the need for switchgear for high voltages, and particularly for outdoor gear, in the most practical manner by laying themselves out to build it in their works at Trafford Park. In the accompanying illustration is shown a 73 000 V oil switch in course of construction in their shops. The line of high voltage outdoor switchgear which they are constructing is practically identical with that built by the Westinghouse Electric & Manufacturing Company in America. It is thus in no sense an experiment, but a series of thoroughly tried-out engineering designs.

The particular switch illustrated is intended for outdoor use, and has an assigned breaking capacity of 300 000 kVA. Duplicate butt



A 300 000 kVA Switch for Outdoor Work.

contacts are employed, these being housed in metal castings of smooth profile to avoid corona trouble. For the purpose of the photograph these shields have been omitted in one case, as have also the porcelain sleeves which are fitted to protect from damage by the arc the lower ends of the condenser terminals. On the bench to the right of the switch will be seen the magnet frame and coil for the electrical operating mechanism. When assembled this stands on the floor at the near end of the switch. The long lever shown on the mechanism bracket is removable, and is mainly used for setting up the contacts during assembly.

Industrial Conditions in Norway in 1921.

The year 1921 for Norway, as for most other countries, was a time of crises. In his annual review of the industrial and economic conditions, Mr. C. L. Paus, H.M. Commercial Secretary at Christiania, states: "The readjustment of values has proceeded apace, and many persons have succumbed to the resulting losses, while the fate of others still hangs in the balance. The national finances are also severely strained, and the sources of taxation have begun to fail, at a time when extraordinary funds are urgently required for the payment of debts and the relief of unemployment. Although the excess of imports over exports is much less than in 1920, the balance of trade remains very unfavourable and Norwegian currency is at a heavy discount, but the general feeling is, whether justifiably or not, more hopeful than it was a year ago."

Requirements of Manufacturers.

The requirements of manufacturers in respect of raw materials and instruments of production fell very far short of the normal owing to acute industrial depression, and the capacity of merchants to absorb further quantities of imported manufactures similarly maintained an unusually low level, owing to the existence within the country of large stocks of such commodities, the abnormal condition of the International exchanges and diminished purchasing power on the part of the public. Currency questions played a most important part in determining the sources from which the small demand for new imports should be satisfied. In this respect German exporters enjoyed a very great advantage, and they were, therefore, in a position to book most of the business in current commodities, although, at the same time, buyers hesitated to place in Germany special orders for large machinery, &c., which involved late delivery and advance payments. British traders, on the other hand, found themselves in a most unfortunate situation, since the high value of sterling as compared with that of Norwegian kroner rendered trading exceedingly difficult, if not altogether impossible.

Slow British Deliveries.

The demand for British goods is stated to have fallen off very greatly owing to slow delivery and the abnormal rate of exchange, so that only specialities, such as particular kinds of steel and patent machines, which cannot be procured elsewhere, are now purchased in the United Kingdom. German exporters appear, by virtue of their low prices, not only to have regained their former position in the market, but to have excluded all competition, although, during the earlier part of the year, a good trade was done from Austria. A large importer considers that, when the sterling exchange returns to a more normal level, British manufacturers will have little difficulty in recovering their old trade in such commodities as drills, files, screw-cutting tools, wrenches, &c., which have a good name in Norway, but that they have little prospect of doing business in machinery unless they have improved upon pre-war patterns.

Electrical Machinery and Insulated Cables.

Owing to the depreciation of the mark, German manufacturers dominated the market for all kinds of electrical machinery and cables. British, American, Swedish and Swiss firms, therefore, experienced great difficulty in doing business. For the same reason Norwegian factories secured a very small portion of the trade: they worked at only about half their capacity and sold at prices which probably entailed a loss.

Owing to the prevailing general depression, and particularly that of the electro-chemical industry, the demand for new supplies for industrial purposes was very small. It is anticipated, however, that 1922 will see a fair demand for small transformers and motors and for cooking and heating apparatus in connection with the realisation of municipal power schemes. It has not hitherto been found that the fall in the price of coal has affected the demand for electrical cooking and heating appliances.

At the present moment German manufacturers are doing a good trade, and it is expected that they will continue to secure the bulk of the business unless the mark recovers in value.

Both the electro-chemical industry and the electro-metallurgical industry have suffered severely. The production of carbide is practically at a standstill, as demand is small and it is found impossible to compete with German prices, particularly in overseas markets. The nitrate factories controlled by Norsk Hydro Elektrisk Kvaelstof Aktieselskab have maintained a good level of production, but have suffered from the German competition. The prospects for the engineering industries are described as poor, but it is hoped that an improvement will result from a reduction of wages this spring, when the rates fixed by compulsory arbitration in 1920 lapse.

Water Power.

The Commission appointed by the Storthing in 1918 to enquire into the question of a national plan for the supply of electricity over the whole of Norway has concluded its preparatory work, and draft proposals will shortly be submitted for satisfying the requirements of practically the whole country in respect of energy for lighting and domestic purposes, and for the use of farmers, craftsmen and small industries, on the basis of 250 W per individual. It is estimated that, without including the cost of supplies already available, it will be necessary to expend a further sum of Kr. 300 000 000 to this end. It is apparently intended, the report states, to suggest that the public authorities of each county shall in the main be made responsible for, and shall be given the necessary powers to undertake, the provision and distribution of electrical

energy within the country in so far as the smaller towns and country municipalities are concerned, while the larger towns will be required to organise their own supply, as, in fact, they have already done.

During and immediately after the war a large number of schemes were initiated by various municipalities with a view to providing electrical energy for domestic and agricultural consumption and for the use of minor industrial concerns, and many waterfalls were harnessed to this end. Arrangements for the distribution of the power which has thus become available are now being made. In view of the prevailing industrial depression and the fact that new supplies of energy are required only for domestic service, it is generally felt that power already harnessed will satisfy the demand for the next few years, unless the electro-chemical and electro-metallurgical industry should receive some at present unforeseen impetus.

Government Power Schemes.

It has been arranged that the municipalities of Christiania and Drammen shall receive from the Rjukan Power Station 12 500 kW and 2 500 kW respectively, while the Buskerud county is to receive 4 000 kW from the same source. The scheme for extending the Labro power station with a view to the delivery of an additional 3 600 kW to the Drammen municipality has been suspended for the present. The Norwegian Government will undertake the construction of the transmission line from Rjukan to Kongsberg, while the Buskerud county and the municipalities of Christiania and Drammen will undertake the transmission for the remaining distances. The construction of this transmission line was commenced in the spring of 1921, and it is expected that the power will become available for use in October this year.

Operations are being continued in connection with the power scheme at Nore, where the tunnel and catchment basin are in process of construction and the site for the pipe line is under preparation. A grant of Kr. 4 500 000 has this year been made to the scheme. Work is also proceeding on the railway from Kongsberg to Nore, upon which Kr. 4 500 000 has now been expended.

Work upon the Hakavik installation, which is to supply power to the Christiania-Drammen railway, is nearing completion, and it is now hoped that electric traffic may commence between Christiania and Sandviken or Asker early this year. It will be necessary, however, to construct a new bridge over the Drammen River before the whole journey can be made by electric train, as the existing bridge is not strong enough to carry the heavy electric locomotives.

At Glomfjord, in the Nordland county, 50 000 H.P. has been installed and the installation of an extra pipe line for 27 000 H.P., together with the necessary electrical equipment, is nearing completion. The State is prepared to consider proposals for the application of this power. A zinc-smelting works controlled by Swedish interests, which has rented 50 000 H.P. from this source, has experienced difficulty in fulfilling its contract, and the State has hitherto received no return for the large capital invested in the power station.

The harnessing of Solbergfos, on the River Glommen, has been continued, and is expected to be completed in 1924. Of the power obtained from this scheme, which has been estimated at 50 000 H.P., one-third will be taken by the municipality of Christiania, two-thirds by the State.

Municipal Power Schemes.

The harnessing of the Raanaasfos on the River Glommen is nearing completion, and it is expected that the Christiania Municipality will shortly take delivery of 12 000 kW from this source.

The offer of power to Christiania from Tysse has not been accepted.

The Bergen Peninsula Power Company, an amalgamation of the Bergen Municipality and a number of small municipalities in the Bergen district, is considering the construction of a 100 000 H.P. station at Dale with a view to the delivery of energy to the members of the company. The scheme of the Bergen Municipality to procure 6 000 kW from Herlandsfos has, therefore, been suspended.

The harnessing of the Höge waterfalls, owned by the Aust Agder county, has now been completed.

Work has continued on the following schemes :

That of Nord Tröndelag county for harnessing the Folla watercourse. It is expected that the delivery of power will commence in about a year's time.

The scheme for the harnessing of the Tafjord watercourse in the Romsdal county.

The scheme of the town of Kristiansand S. for the harnessing of the Nomeland fall.

That of the town of Fredrikshald for power stations on the Brekke and Krappeto waterfalls.

The Troms county has initiated a scheme to procure 2 000 H.P. from the Bardo waterfall.

The scheme of the Aalfot Power Company for harnessing the Aalfot waterfall is still in suspense owing to financial difficulties.

Private Power Schemes.

No new private power schemes have been initiated.

As regards old schemes, the position is as follows :

The carbide factories for which the power from the Saude Falls was intended have not yet been put into operation, but several thousand kilowatts form this source are now delivered to local municipalities.

A/S Bremanger Kraftselskap have completed their power station at Svaelgen, and the Nordre Bergenhus county have nearly finished the construction of the transmission net.

A/S Björkaasen Mining Company have completed the harnessing of 7 000 H.P. for their own use.

State Aid to Municipal Power Schemes.

On February 23, 1921, the Norwegian Ministry of Finance concluded with a syndicate of Norwegian banks a loan of Kr.50 000 000 to be devoted to assisting various municipalities in completing power schemes which had been interrupted owing to financial difficulties. From this fund advances have been made of Kr.6 000 000 to the Aust Agder Municipality, Kr.14 000 000 to the Tafjord Power Company and Kr.9 000 000 to the Nord Tröndelag County in aid of schemes mentioned above. A number of other municipalities have also received assistance.

Export of Hydro-Electrical Power.

The commission consisting of members appointed by the Norwegian, Swedish and Danish Governments to consider the possibility of transmitting electrical power from Norway to Denmark has continued its deliberations during the present year. Norwegian experts are of opinion that the scheme will eventually be realised, although financial and technical difficulties have first to be overcome. It is expected that by the end of 1924, which is considered the earliest date at which the transmission line could be completed, Norway will be in possession of a considerable surplus of power available for export. The question whether the power should be carried overland through Sweden or by a submarine cable direct to Denmark remains unsettled, but the former alternative seems to be regarded with most favour.

Railway Electrification.

The electrification of the railway line from Christiania to Drammen is nearing completion, and it is hoped that it will be possible to open the section Christiania-Asker (about 26 kilometres) for electric traffic early this year.

Work is proceeding upon the electrification of the Ofot Railway (from Narvik to the Swedish border).

The question of the electrification of other sections of railway is still under consideration.

Theoretical and Practical Engineering.

Engineer Vice-Admiral Sir George Goodwin Engineer-in-Chief of the Fleet, delivered an address on Saturday night as honorary president of the Engineering Society of the University College of Southampton. Mr. John Smith, of Thornycrofts, the retiring honorary president, was in the chair.

Sir George Goodwin said that college societies in engineering centres where practical work could be associated with study and research must be productive of a great deal of good—both to the students and to the experienced engineer. Perhaps the connection between the school and the shop had not been sufficiently thorough. In many cases the effect had been to produce two different types of engineers, one regarding himself as highly accomplished in theoretical engineering and being somewhat disdainful of operative and manipulative skill; the other equally proud of his practical proficiency, and especially of the fact that no one could possibly accuse him of being an "x chaser." The differences sometimes became acute, and the result was very unfortunate. As an example of the advantage of a student combining theoretical and practical knowledge, Sir George Goodwin referred to turbine reduction gearing. The idea of it emanated from theoretical considerations alone, but it would never have materialised except through the skill of the workman. The responsibility that engineering education and training proceeded on proper lines rested with the university authorities and other bodies who controlled the respective syllabuses. He did not find much fault with their syllabuses, but he did wish that those who drew them up would include just sufficient to ensure due appreciation of the interdependence of theory and practice.

Ball Bearings in Electrical Machinery.

At the Birmingham and District Electric Club on March 11 a paper on "Ball Bearings, with Special Reference to Electrical Machinery," was read by Mr. C. Allen, of the Skefko Ball Bearing Company. The lecturer gave an account of the physical, mechanical and mathematical considerations which govern the design and construction of ball and roller bearings, with special reference to the investigations of Hertz, Striebeck and Goodman. Single row and double row self-aligning bearings were explained, with the thrust capacity of each type. A number of figures were given, bearing upon transmission efficiency of plain and ball bearings, the co-efficient of friction of ball bearings being given at 0·001, and of plain bearings, under good conditions, of at least ten times this figure, thereby making possible an economy of power loss of 90 per cent. In electric motors ball bearings were extensively used in small powers, but in shafts over 2½in. diameter trouble had been experienced. Some of the causes of the trouble were analysed, and an account was given of recent experience and practice on the Continent and in America, where large motors and rotary converters were being constructed with ball bearings with very satisfactory results, and the larger British manufacturers were now making serious investigations into the subject.

Bringing Victorian Economics Up-to-Date.

By ERNEST J. P. BENN.

Since the War everybody is talking of economics and the interest in the dry-as-dust science has spread to every part of the community. Politicians, industrial leaders, and students of economic questions generally have, under war pressure, rushed at the writings of the mid-Victorian era and accepted the sayings of Adam Smith, Karl Marx, and their contemporaries almost as if they were revealed truth, and based their arguments and actions upon them almost without further enquiry. But surely a science of economics which was formulated before the days of electricity may be as useless as a science of medicine which overlooked the discovery of the circulation of the blood. Karl Marx told us that wealth arises from land and labour, Sidney Webb has widened the meaning of the term "labour" to include forms of toil which do not soil the hands, and that is really about as far as many of us have got in the science of economics. It is indeed questionable whether we have begun on economics, properly so called, at all, and whether such thoughts as we employ in this direction would not be more correctly described as "Sidney Webbics." So little has the science of economics advanced with the times and taken cognisance of human development, that Professor Ramsey Muir is at this moment busy saying in the language of 1920 almost exactly what Karl Marx said in 1860 and Sidney Webb in 1890. England is becoming a mass of Socialism, and unless we realise that fact the present process of universal limitation will continue, the standard of living will get lower and lower, and the glorious era of wealth production which is really England's contribution to humanity may be said to be drawing to a close.

A Fresh Start.

We must start again, and there could not be a better time to start. The first big fact which must be accepted from the house-tops, and written in capital letters in the front of our minds, is that we live by exchange. If only we would digest that one big truth we should be able to get the others into true perspective. Capital and labour would cease to occupy the whole of the stage as they have hitherto done, and we should realise that the prime factor in the creation of wealth is neither capital nor labour, but exchange. The War has given us our first real chance to grasp and understand this. Commodities are not in themselves wealth. They may be the raw materials of wealth, but they only become the real thing when they are exchanged. If the Isle of Wight were heaped up sky-high with pianos there would be a good deal of labour and a good deal of capital involved in the process, but there would be nothing which could be recognised as wealth. Capital and labour would in that case both have performed their functions, and both, no doubt, would be engaged in arguing as to their respective proportions of the property; the argument would be the only music arising from this wonderful plethora of pianos.

We talk of the laws of supply and demand, but we forget that both supply and demand require making, and demand often requires more making than supply. The man who can bring supply and demand together is performing a higher function than he who can make supply or he who possesses demand.

The Land of Practical Economics.

America is the land of practical economics. They seem to be gifted over there with an understanding of the science of wealth creation. They spend a far higher percentage of the price of an article upon the selling of it than is usual in any other country of the world. That does not mean that American prices are high; their successful competition in foreign markets proves the contrary. By providing adequate remuneration for the sellers or exchangers the Americans succeed in exchanging goods at a quicker rate than the rest of us, which is the whole secret of mass production with its high wages, high profits, and low prices.

The new economics which cannot now be long delayed will classify us in a more scientific manner and correct our sense of proportion. Instead of a Labour Party we shall have an Exchange Party, into which will congregate all the people who really carry the bulk of the responsibility for wealth creation. The Exchange Party membership will consist of merchants, shopkeepers, travellers, salesmen, advertisers, and demand-creators generally. It will embrace all those brains which Mr. Sidney Webb has made such frantic efforts to secure for Labour. Everyone who is engaged in doing anything to facilitate exchange, which means everyone who takes an interest in his job and really does his duty, will be an enthusiastic member of the Exchange Party. Behind this front rank of the industrial army will range themselves side by side the old-fashioned Capital and Labour, each recognising that they are necessary, but subsidiary, functionaries.

In some such way as this we shall be able to support our populations in ever increasing comfort, and provide for larger populations yet to come; but unless we do take some such steps, unless we learn in time the lesson of Russia, then we shall assuredly have to face a steady reduction in the standard of living, and the corresponding necessary reduction in the numbers of the human race.

The Acting British Consul-General at SAN FRANCISCO reports that a local firm of dealers in china, glassware and household appliances are desirous of buying household electric appliances direct from United Kingdom manufacturers. Further particulars can be obtained from the Department of Overseas Trade. (Ref. D.O.T. 14 359/F.W./S.C. 2.)

Telephone Developments in the North.

Mr. J. R. M. Elliott, Superintendent Engineer at Newcastle Post Office, delivered an address on "Telephones" to the NEWCASTLE ROTARY CLUB last week, dealing particularly with developments in the northern district. In Newcastle, he said, the necessity for a new exchange, to take the place of the existing City and Central Exchanges, had for some time past been under consideration. A site was available for the erection of a new building, and investigations were proceeding with a view to determining whether the system to be adopted should be manual or automatic. In the event of the decision being in favour of automatics, it would be necessary to convert all the exchanges within a radius of a few miles of Newcastle to automatic also.

In this connection it might be of interest to know that the private branch exchange system of one of the largest engineering works on Tyneside had been converted by the department to automatic working.

Extensive Programme.

The programme of new underground cables which was in hand was extensive. At Gateshead eleven miles of new cable were being laid, comprising 1 100 miles of wire, and on completion 600 miles of open wire on congested pole routes would be taken down.

In Newcastle twenty-seven miles of cable, comprising 5 000 miles of wire, were being added in seven different areas to the existing plant, and the work was nearing completion.

For Wallsend and Walker area the work of laying seven miles of cable, comprising 650 miles of wire, was also progressing; and at Jarrow and Hebburn work of a similar character was nearing completion, whilst at North Shields, Tynemouth, and Whitley Bay the existing cables were being augmented.

Since the war new cable plant had been provided or was in course of provision for local development purposes at forty-two different centres throughout the district. The cables reached an aggregate of ninety-three miles, and comprised 11 000 miles of wire, the total cost having been £150 000.

In addition to these local development works, a main cable route was at the moment being constructed between Newcastle and Durham, and thence to West Hartlepool, a distance of thirty-two miles, and, when finished, would increase the trunk facilities to the Durham and Hartlepool areas. The cables would contain over 5 000 miles of wire, and the cost of the work would be about £142 000.

The open line trunk facilities of the district had been increased during the past two years by eighty-four new circuits, involving the erection of 1 300 miles of wire, at a cost of £47 500.

A new cable route between London and Glasgow had been decided upon, having repeater stations at sixty-mile intervals. The route would pass through Catterick, Darlington, Durham, Newcastle, Otterburn and Jedburgh. When this cable was completed, the local long-distance trunk facilities, now available, would be greatly augmented, as the new route would provide for the industrial centres of the North-East Coast. The cost of this particular work would be about £500 000, a development in which Newcastle directly participated.

Low-grade Coals for Electric Power.

In a paper read before the Society of Arts recently, Professor W. A. Bone discussed the UTILISATION OF BROWN COALS AND LIGNITES, and the steps which are being taken in Australia towards the production of cheap electric power by this means. In the Latrobe Valley, Victoria, there is an area which is estimated to contain, within 1 000 ft. of the surface, over 31 000 000 tons of brown coals and lignites. These are low-grade fuels, which contain something like 50 per cent. of water in the raw state, but by a drying process the water content can be considerably reduced.

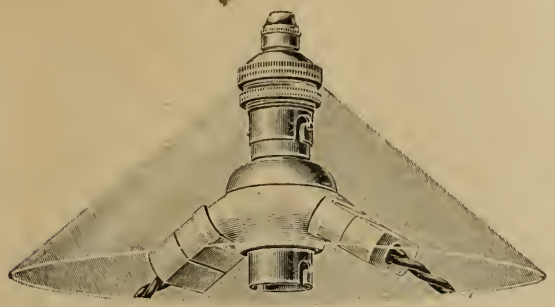
Researches have been carried out by Prof. Bone in the direction of the heat treatment of these fuels below 400° C. as a possible method of enhancing their fuel values, and it has been found that such treatment affords a ready means of up-grading such coals, and of improving their fuel values generally. The Underfeed Stoker Company have designed and patented an apparatus for both drying and up-grading the fuel continuously in one operation, using only the sensible heat in the burnt gases passing away from a boiler.

One of these specially fitted mechanical stokers has been installed at Morwell, and is now undergoing systematic trials there under the supervision of Mr. H. R. Harper, their Chief Engineer. One of the principal advantages of such a fuel provider in connection with big power-station boiler installations, such as at Morwell, where low-grade brown coal must be used, is that by so drying and up-grading the fuel before burning in the boiler grate, it will give a much hotter and more radiant fire than it would otherwise do, with consequent increase in both the steam output per boiler and the thermal efficiency of the system as a whole. The Underfeed Company guaranteed that nine boilers fitted with their new fuel improver attachment would give the same steam output as twelve boilers fired with the untreated fuel, and with a greater thermal efficiency.

During the discussion which followed the reading of the paper, Mr. John McWhae, Agent-General for Victoria, said it was anticipated that early in 1924 electrical energy would be supplied from Morwell throughout the whole State. It was calculated that they would be able to supply electrical energy to manufacturers at £4 8s. per H.P. year, and at the mine mouth at £2 17s. 6d. per H.P. year.

Eastick Lampholder Adapter.

This lampholder adapter, which is marketed by J. J. Eastick & Sons, 4, Belfast-road, Stoke Newington Station, London, N.16, is becoming popular with users of electric lighting appliances, because



The Eastick Lampholder Adapter.

the plugs are at an angle, and they can be easily attached without removing the lampshade. Wiring contractors and supplies dealers can obtain further particulars, including trade terms, of this device from the makers.

Co-Operative Non-Ferrous Research.

At the second annual meeting of the British Non-Ferrous Metals Research Association at Birmingham, the chairman, Mr. T. Bolton, detailed the progress of the association during the year, and referred particularly to the organisation of the body, the work in progress, and to the proposed establishment of research fellowships at the Universities. The association was one of the very few which admitted users or consumers to membership on the same terms as manufacturers or producers, and they hoped to obtain support from the engineering and other great industries. The majority of the work in hand referred to copper, as most of the support came from that section of the trade.

Dr. W. Rosenhain, of the National Physical Laboratory, stressed the fact that many non-ferrous troubles could not be solved because there was insufficient fundamental knowledge, to secure which men and money were necessary. He thought the Research Association an ideal channel through which such research could be arranged, because it provided the means whereby research could be applied in industry after having been carried out in the laboratory. He also instanced recent advances in the ferrous industries, which would necessitate non-ferrous manufacturers making efforts to regain their position.

Sir Frank Heath, Secretary of the Scientific and Industrial Research Dept., congratulated the association on the extraordinary expansion which had taken place during the past year in its membership and activities, and illustrated the way in which the user and producer could aid each other by proper co-operation. He considered the establishment of an intelligence service one of the most valuable things an association could do, and offered the aid of his department in working out a scheme of research fellowships. It was significant of the view now taken by business men that the Geddes Committee had not recommended any cuts in his department, but he hinted that manufacturers should use the million pound fund for research as expeditiously as possible.

Other speakers included Vice-Admiral Sir George Goodwin, Engineer-in-Chief to the Admiralty and President of the Institute of Metals; Sir Henry Fowler, Chief Mechanical Engineer to the Midland Railway; Sir Gerard Muntz and Sir Richard Threlfall.

I.E.E. Summer Meeting.

The summer meeting of the Institution of Electrical Engineers will take place in Scotland from May 30 to June 2. The programme is substantially the same as that of the meeting arranged for last year, which was abandoned on account of the coal strike.

On the first day a visit will be paid to Dalmarnock generating station. This will be preceded by a Paper by Mr. R. B. Mitchell on the station, and subsequently a lunch will be held at the Municipal Building by invitation of the Corporation of Glasgow. In the afternoon visits will be paid to the works of John Brown & Company, the Clyde's Mill power station of the Clyde Valley Electrical Power Company, and some of the Glasgow Corporation reservoirs. In the evening a reception will be held at the Municipal Buildings by the Corporation of Glasgow.

On the morning of May 31 a Paper will be read at the Glasgow University by Prof. Magnus Maclean on "The Hydro-Electric Resources of the Scottish Highlands." In the afternoon a visit will be paid to the works of Babcock & Wilcox at Renfrew, which will be followed by a steamer excursion on the Firth of Clyde by the invitation of the firm.

On Thursday, June 1, the party will leave Glasgow, breaking their journey at Tulloch to inspect the sources of supply of the Lochaber water power scheme, and arriving at Fort William in the evening. On Friday a steamer excursion will be made to Kinlochleven, where the works of the British Aluminium Company will be inspected, and the party will afterwards proceed to Oban.

E

High Electric Ordnance Crane.

The Cleveland Crane and Engineering Company, Wickliffe, Ohio, have recently built a 75-ton electric travelling crane for handling naval guns of the larger sizes during heat-treatment operations at the U.S. naval ordnance plant at Charleston, W. Va. The run-way, states the "Times Trade Supplement," is 165 ft. above the ground, and the lift is believed to be the highest ever arranged for in a crane of this type. An exceptionally high lift is required, because the guns, which, with their test piece, are 87 ft. long, have to be handled in a vertical position. The guns are brought to the plant on railway trucks, placed in a vertical position in a heat-treating furnace, and after being heated are lifted from the furnace and placed vertically in a tempering tank, 108 ft. deep. These tanks extend into a pit 60 ft. below the floor and project 48 ft. above the floor level, so that the upper end of the gun must be raised at least 135 ft. to permit the lower end to clear the top of the tank.

The crane run-way, being the height of an average 15-storey office structure, a building of unusually massive construction is required to carry the load. A locomotive crane with a 250 ft. boom was used in handling the steel during the construction period. In addition to the height of lift, the outstanding features of the crane include a high speed of lift and a span which is exceptionally long, 104 ft., for the capacity. The hoisting speed is 50 ft. a minute and the lowering speed double that figure, both these rates being with a full load. In this way the guns can be handled between the furnace and the quenching tank very rapidly. Another interesting feature is that when lowering the rated full load at the maximum speed the braking equipment provided will stop the load within 1 ft. The crane has an automatic limit switch that stops the load 110 ft. below the crane rail. Should it be necessary to lower the gun farther, the operation is continued by the use of a push button.

The trolley and the bridge each travel at the rate of 50 ft. a minute, rapid bridge travel not being required, as the crane run-way is comparatively short and only of sufficient length to cover the furnaces and the tempering tanks. The crane is operated from a pulpit, and magnetic control is provided throughout. Five motors aggregating 550 h.p. are used in its operation—two 200 h.p. motors on the main hoist, a 50 h.p. motor for the trolley travel and two 50 h.p. motors for the bridge travel, there being one motor on each bridge girder. The hoist has brakes on each motor and on the second reduction shaft. On account of the high lift the hoist requires 2 600 ft. of $1\frac{1}{8}$ in. rope.

The Newspaper Press Fund.

The announcement that Lord Leverhulme is to preside at the fifty-ninth Annual Dinner of the Newspaper Press Fund on April 27 draws attention to an organisation of which the outside world knows but little. By the very conditions of his occupation the journalist is, for the most part, anonymous. Consequently, dependent though we are all upon him for news of the happenings of the day, it is inevitable that, if in the stress and competition of modern life he "goes under," very few beyond his immediate circle and those dependent on him are aware of his distress.

It was to help the journalist who has fallen on evil days, and the widow and children he may leave behind him unprovided for, that the Newspaper Press Fund was founded in 1864, and for nearly sixty years it has done splendid work in relieving sickness and want among the journalistic profession. Last year, owing to the general depression, the claims were exceptionally heavy, and the fund distributed in grants and pensions the record sum of over £10 000.

The regular income of the fund, from members' subscriptions and interest on investments, covers less than half this sum, and if it is to meet the calls upon it, to say nothing of extending its beneficent operations, a large amount of money has to be found from outside sources every year.

It is undoubtedly merely lack of knowledge which has prevented the public in the past from coming more generously to the support of the men, who not only in their ordinary vocation render valuable service alike to the business and the social world, but who are themselves always among the first to give their services freely in any worthy charitable cause.

Cheques should be made payable to the Secretary, Newspaper Press Fund, 11, Garrick-street, W.C. 2.

The extension of electricity supply to the communes and rural districts of Belgium is attracting much attention at present, and in the case of East Flanders the Provincial Governor (Count Kerchove) has put forward a scheme under which the Provincial Council and the communes would provide the necessary capital for the distributing companies. Of the 297 communes in the province, 101 of the most populous have electricity supply, and a credit of five million francs has been voted for the proposed extensions of mains, &c. Most of the other provinces have taken somewhat similar steps to provide a supply of electrical energy. The communes of Houdeng-Gœgnies, Houdeng-Aimeries and Strépy-Bracquegnies have just decided to provide a supply of electricity for lighting and power. They will lay the distributing network and purchase high-tension three-phase current (50 periods) in bulk. It is proposed to enter into a thirty years' contract, and at the outset 250 kW will be required. The town of Dinant is also inviting tenders for a supply.

Legal Intelligence.

The Lodge Tuned Wireless Patent.

The Royal Commission on Awards to Inventors continued on Monday the hearing of the claims of Marconi's Wireless Telegraph Company and Lodge Muirhead Wireless and General Telegraphy Syndicate in respect of the infringement by the Admiralty of Patent No. 11 575 of 1897.

The Attorney-General said that the Admiralty had paid the Marconi Company £257 000, of which £77 000 was for thirteen strategic stations. He submitted that the balance, £180 000, sufficed to liquidate the claims.

Mr. J. Hunter Gray, K.C., said that if the Commission meant to take into account the amount already paid the company would not submit to arbitration. They were only prepared to discuss the question of what was due on installations for which no royalty had been paid.

The Chairman said what had been referred to them for decision was the amount to be paid by the Admiralty for the use of the patent in the whole of the installations, whether royalty had been paid in respect of them or not. That would be a preliminary step to ascertaining what was the amount finally due.

An adjournment to permit of consideration of the legal position was granted on the application of Mr. Gray, who said in the event of an agreement he would call Mr. Marconi as a witness.

Theft of Electric Lamps.

Two young men, James Young, a porter, and John Sheldrake, painter's mate, were charged on remand at the Mansion House on Tuesday with being concerned in stealing 3 100 electric lamps, value £490, the property of the B.T.T. Lamp and Accessories Company. On Feb. 9 the padlock staple was removed from the door of the company's premises and the lamps were taken away. Both prisoners pleaded guilty to the theft and made statements. They alleged that they sold the lamps for £85 to an engineer named Kelly.

Mr. Reader, the contractor whose horse and van were used, denied that he had received £5 from the accused, and Mr. Kelly said he dealt principally in sewing machines and motor-cars; he did not sell many lamps. He did not buy any from the accused, and he had no warehouse in Old Montague-street, where they were alleged to have been taken. Counsel for Kelly said the latter had a recollection that some time since Sheldrake asked him to buy some lamps at a very low price. He communicated with the police, and that perhaps was the ground of this wicked suggestion of prisoners.

The Lord Mayor sentenced Young to six and Sheldrake to two months, each in the second division. With regard to Reader, he could not help thinking he knew more about the matter than had come out, but he did not believe the accusation against Kelly.

A. E. Wall v. Falcke.

On Tuesday Mr. Justice Branson heard this action, brought by the plaintiff to recover £250 from Mr. Cecil D. Falcke, secretary of the B. E. Company (of London and Birmingham), Ltd., manufacturing electricians.

It appeared that plaintiff took over the business of Witehall & Company (electric switch manufacturers) after the war, and he came to an arrangement with defendant to have the use of his company's selling organisation. Plaintiff said part of the arrangement was that he should take £250 worth of shares from one of the defendant company's shareholders, a Mr. Baylis. He alleged that though he had paid his £250 he had not received the shares, and therefore he asked for the return of his money.

The defence was that it was never proposed that plaintiff should have 250 shares, but that his payment was an instalment in part payment for £750 worth of shares. In his evidence defendant said he did not stand to make or lose anything out of the transaction, and Mr. Baylis knew that witness was selling the shares to plaintiff.

His Lordship accepted plaintiff's version, and gave judgment for plaintiff for the amount claimed and costs. The counter-claim for £500, the alleged balance for the 750 shares, was dismissed.

A Disputed Settlement.

On Tuesday Mr. Justice Swift heard an action by the Christian Bergh Electric Company, Ltd., against the E. C. Brooks-Voss & Company, of Birmingham, to recover £16 12s. 8d., the amount of two bills of exchange, dated Dec. 1 and Jan. 7 last. It was stated that the bills were part of a series of ten given in settlement of an action brought by plaintiffs against the defendants in May last. Defendants agreed to pay £36 on account and the balance by ten monthly bills of £80 each.

For defendants it was stated that they desired to raise a counter-claim to set aside the agreement of settlement.

His Lordship said he must give judgment for plaintiffs for the amount claimed with costs, but defendants could bring another action to set aside the agreement.

Patent Cases.

An interesting amendment of Patent No. 142 934, relating to electrodes for soldering and depositing metals by an electric arc wound with asbestos yarn, subsequently coated, was recently authorised by the High Court. An application for the revocation of the patent was made, but we learn from "Engineering" that the judge allowed the cancellation of two claims and the deletion of parts of the specification, so as to make the amended document cover only the original invention claimed. According to the modified claims, the electrodes are wound with asbestos yarn in open spirals, coated with a silicious compound, and a fluid slag-forming mixture containing lime is afterwards added, with or without a suitable proportion of powdered aluminium.

Another interesting case which raised the question of what is a patentable invention came before the Solicitor-General on appeal from the decision of the Comptroller-General of Patents that an application disclosed no "manner of new manufacture." The specification described the use in a high-compression internal-combustion engine of a hydrocarbon fuel having a high heat value and a high critical compression, namely, a cyclic compound of the naphthene group, for example, cyclohexane. The claim was for the method of using the fuel, and it was argued for appellants that, although cyclohexane was a known compound, it had formerly been known only as a laboratory substance, and that they were the first to discover its advantages as a fuel.

The Solicitor-General held that it was a well-established principle of patent law that once a substance is known, its methods of production ascertained and its characteristics well defined, a patent cannot be granted for its mere application to an unknown purpose. The specification gave no indication of any special feature of novelty in the engine in which the fuel was to be used, beyond that it was a "super-duty" engine. The use of such a known substance in a known type of engine might be a useful discovery and have valuable results, but it was not invention within its statutory meaning.

Parliamentary Intelligence.

Special Orders.

The House of Commons have approved the Special Orders made by the Electricity Commissioners and confirmed by the Minister of Transport in respect of part of the parish or township of Wye, in Kent; the urban district of Wigston Magna; parts of the rural districts of Blaby, Hinckley and Lutterworth, in the county of Leicester; the urban district of Cheadle and Gatley, in the county of Chester; the urban districts of Haywards Heath and Cuckfield, and parts of the rural districts of Cuckfield and Chailey, in East Sussex; the burgh of Johnstone, in the county of Renfrew; the burgh of Milngavie and part of the parish of New Kilpatrick, in the county of Dunbarton; the urban districts of Bromyard and Kington and the rural districts of Bredwardine, Bromyard, Dore, Hereford, Kington, Leominster, Ross, Weobley, Whitchurch and Wigmore, and part of the rural district of Ledbury, all in the county of Hereford, and for the amendment of the Hereford Electric Lighting Order, 1898; the county borough of Preston, the urban district of Fulwood, and the townships of Broughton Lea Ashton Ingol and Cottam Woodplumpton Barton and Penwortham, in the rural district of Preston. They have also approved the Special Order amending certain Provisional Orders granted to the Electrical Distribution of Yorkshire, Ltd.

French Telephone Service.

Mr. Pike Pease (Assistant Postmaster-General), in reply to Sir J. D. Rees (House of Commons, March 20), who asked whether he had information to the effect that a Bill had been introduced into the French Chamber to transfer the national telephone back to a private company, said, so far as he was aware, the answer was in the negative. A Bill was introduced by the Minister of Public Works and the Minister of Finance on Jan. 12 this year to abolish the flat rates and substitute a general message rate on the grounds that a more equitable basis of charge, by which subscribers paid according to the use made of the service, would tend to develop the system, enable an improvement in the service to be effected, and at the same time restore the balance of expenditure and receipts.

Water-Power Developments.

In the House of Commons last week, in reply to Mr. Perkins, Mr. Baldwin stated that the Government did not see their way at present to introduce legislation dealing with the control of water-power developments or constituting a Water Commission, as proposed by the Water-Power Resources Committee, but the Minister of Health had taken certain administrative measures, and was setting up an Inter-Departmental Committee, as recommended by the Committee, to co-ordinate the work of the several Departments responsible for the different water interests.

Marconi Bonds (China).

In reply to Colonel Wedgwood (House of Commons, March 17), Mr. Harmsworth stated that H.M. Minister at Peking had been and was continuing to press the Chinese Government for the payment of the interest due on these bonds.

The Toll Exchange.

In the House of Commons last week Mr. Pease stated that there was no intention at present to extend the toll area for telephone calls.

The Education Estimates for the coming financial year show decreased grants for scientific investigation and industrial research. Scientific and industrial research salaries are £9 945 lower; the Fuel Research Board salaries are £1 393 lower, and the grant for experimental plant is reduced by £8 000. Expenses of research boards and committees are £26 880 and development grants £39 500 lower than in 1921-22. The National Physical Laboratory salaries are down by £21 035, and the sum for new researches is reduced by £10 156. Grants in aid for universities and colleges are also £247 000 less.

Electricity Supply.

At SALFORD Council meeting on Wednesday morning last week's decision was reversed on the Electricity Committee's recommendation, and the question of Mr. J. A. Robertson's appointment as consulting engineer was referred to a special committee of the Council.

The Finance and General Purposes Committee of HAMMERSMITH Borough Council recommend that £7 300, part of the estimated net surplus on the electricity undertaking for the current year, be carried to the credit of the Borough General Rate for the ensuing half year. This is equal to a 2d. rate.

The Minister of Transport proposes to confirm the Special Order made by the Electricity Commissioners authorising HULL CORPORATION to supply electricity in Sculcoates Rural District. Any objections must be sent to the Secretary, Ministry of Transport, 6, Whitehall-gardens, London, S.W. 1, by April 10.

BECKENHAM Electricity Undertaking, which has been run at a loss for several years, and last year made a loss of £3 156, has this year made a gross profit of over £19 000. In announcing the fact at the last meeting of the Council, Councillor Oliver said that the success was chiefly due to the new machinery which had been installed and which enabled them to save 56 per cent. in the consumption of coal. In addition, the cost of labour and materials both showed a decided reduction.

The appointment of an expert to report on HULL electricity undertaking, as recommended by the Inquiry Committee and confirmed by the City Council, was considered by the newly-formed Electricity Committee last week, when it was decided that the chairman (Councillor T. McLeod), deputy-chairman, Lord Mayor, and the Town Clerk should be empowered to make a selection from four experts nominated by Mr. J. S. Highfield, president of the Institution of Electrical Engineers.

A committee of representatives of electric supply undertakers in the WEST OF SCOTLAND ELECTRICITY DISTRICT has been formed in order to prepare a scheme of reorganisation. The committee consists of one representative each from the counties of Renfrew, Ayr, Dumbarton, Lanark and Stirling; Glasgow Corporation Electricity and Tramways Departments; the burghs of Paisley, Greenock, Ayr, Kilmarnock, Hamilton, Motherwell and Wishaw, and each of the authorised electrical companies in the district. The engineers and town clerks are to prepare a draft scheme or schemes for the committee.

New Schemes and Mains Extensions.

The Norchard Syndicate, Ltd., LYDNEY, have applied to the Electricity Commissioners for permission to erect an electricity generating station adjoining the Norchard Colliery.

TAUNTON Town Council has applied to the Electricity Commissioners for a loan of £1 500 to meet extras on contract for the installation of a new turbine plant. The estimated cost was £12 000 and the actual outlay £13 497 11s. 1d.

ESTON Urban Council has agreed upon a scheme of electricity supply for the town. Since the scheme was first proposed the contract price of the plant and mains is £14 000 below the original estimate.

CRIEFF Town Council have asked Mr. J. E. Sayers, of Glasgow, to act as consulting electrical engineer for their electricity supply scheme. The Burgh Special Order has been granted by the Electricity Commissioners and now awaits the formal approval of Parliament.

Alteration of Charges.

The increased charges for electricity which were made at COVENTRY to meet the additional expenditure incurred by the coal strike last year are to be withdrawn as from Jan. 1 last, to both bulk and private consumers.

RAMSGATE and District Electric Supply Co. has reduced the price of electricity for power, heating and cooking by ½d. per unit. The charges now are: Power, first 100 units per quarter, 7d.; next 3 000, 4d.; beyond, 3d.; heating and cooking, first 100 units, 4d.; beyond, 3d.

A further reduction in the price of electricity in SHEFFIELD is notified. This latest concession dates from the present quarter's reading, and, together with the reductions made in June and September last, means that about one-half of the maximum increase imposed as a result of the war has now been swept away. A year ago the increases on the pre-war rate were: 50 per cent. on all units over 2d. and 150 on units of 2d. and under. These rates are now reduced to: 30 per cent. on all units over 2d. and 75 on units of 2d. and under

Reduced scales of charges for electricity supply have been adopted by HACKNEY Borough Council. In future every lighting consumer will make a minimum payment of 10s. a quarter, and he can pay either £3 15s. per quarter per kilowatt demanded, plus 1d. a unit, or a flat rate of 6d. or if by prepayment meter 8d. per unit. For power the charge will be £1 12s. 6d. per kW demanded, plus ½d., or a flat rate of 6d., or if by prepayment meter 8d. per unit for June and September quarters and 2d. in December and March quarters. For domestic supply, where the premises are wired throughout, the tariff will be a fixed charge of 2s. per quarter per 60 W lamp equivalent, plus 1d. a unit. For charging batteries of electric vehicles the standard scale will be 1d. a unit, but the Council reserve the right to cut off supply between 4 and 6 p.m. from October to February, and for charging batteries at 90 to 110 V the charge will be 2d. per unit.

Electric Traction.

BURNLEY Town Council have set aside £10 020 to provide the amount expended by the Tramways Committee in relaying the permanent way.

SIR WILLIAM MARWOOD and COLONEL PRINGLE, on behalf of the Ministry of Transport, will conduct the inquiry into the system of traction to be used in Princes-street, Edinburgh.

CARDIFF City Council have given full powers to the Electricity and Tramways Committee in connection with the proposed purchase of the Llandaff North and Whitchurch motor omnibus undertaking.

Since the reintroduction of penny fares on the BRIGHTON tramways there has been a large increase in the number of passengers carried, and the falling off in revenue is also stated to be less than a month ago.

The Minister of Transport has extended until August 7 next the period allowed by the SWANSEA CORPORATION ACT, 1912, for the completion of the tramways authorised by that Act, and for the compulsory purchase of lands for Part IV. (Electricity) of the said Act.

Traffic on the whole of the Underground railway system (except the Central London Railway, which has its own power plant) was "held up" for twenty minutes last Thursday afternoon owing to the FUSING OF A HIGH-TENSION SWITCH AT THE LOTS-ROAD POWER STATION, CHELSEA.

The Minister of Transport has extended until May 31, 1923, the period allowed by the CHESTERFIELD CORPORATION ACT, 1914, for the completion of tramways, and that allowed by the CHESTERFIELD CORPORATION RAILLESS TRACTION ACT, 1913, for the completion of overhead equipment, and other apparatus for working trolley vehicles.

At the annual meeting of GLASGOW SUBWAY RAILWAY COMPANY last week the chairman said that the Corporation had offered to purchase the subway, but at such a price that the directors did not feel they could even put it before the shareholders. It was probable, however, that further negotiations would take place both with the Corporation and with other parties. The directors recently had a report on electrifying the subway, and it was estimated that the cost would be £100 000.

Acting on the advice of Mr. E. W. Cockerlyne, highways and permanent way engineer of Leeds, KEIGHLEY Tramways Committee recommend the Council to apply to the Ministry of Transport for power to borrow £40 000 for the purpose of reconstructing about two and a half miles of single track. The Committee also recommend that as from April 1 the ordinary fare on each stage be increased from 1d. to 1½d., provided that the fares for children and workmen, and the hours of the issue of workmen's tickets, shall remain as at present.

NEWCASTLE-ON-TYNE Tramway men, after a twenty-two days' strike, decided on Sunday to accept the employers' terms, which included the working of a 48-hour week and full observance of the national agreement. A ballot was taken on Saturday, which resulted in 887 votes for and 185 against the offer. But the question arose as to how the men of the other unions out on strike would be affected by this decision. At a meeting on Sunday, however, the following resolutions were put, and the former was carried by a fairly large majority: (1) "That we accept the ballot vote as taken on Saturday, and return to work to-morrow. In the event of any of our members being instructed to do the work of the men on strike, they shall be instructed to refuse to blackleg." (2) "That this mass meeting decides to remain out on strike in conjunction with the members of other unions in order to assist them to get a satisfactory settlement to their claims."

EDINBURGH Corporation give notice of intention to apply to the Secretary for Scotland on or before April 18 for a Provisional Order authorising the Corporation to construct certain new tramways in the City of Edinburgh; to run coupled and trailer cars on the new and existing tramways; to acquire certain lands and to carry out specified works; to authorise the local authorities of Musselburgh, Prestonpans, and Cockenzie and Port Seton respectively, and the local authority of the County of East Lothian, or any of them who possesses the right of purchase of any of the undertakings of the Musselburgh and District Electric Light and Traction Company to transfer to the Corporation such undertakings, upon exercise of their purchase rights; to authorise the Corporation to suspend the sinking fund in connection with the money borrowed for the Portobello station and sub-stations and mains in connection therewith; to borrow money for the conversion of the Corporation tramways to electric traction, &c.

The ELECTRIC VEHICLE is steadily increasing in popularity, and is being used in a wider field for transport purposes. A London firm of brewers have decided, after tests of steam, petrol and electric vehicles, that horse traction is too expensive to be maintained, and to dispose of the steam lorries, of which several five-tonners have been in service. For the longer journeys 40 H.P. petrol-driven four-ton vehicles will be employed, but electric battery vehicles will be used for London deliveries within a radius of eight miles, as these have proved themselves to be eminently suitable. The operating costs, including depreciation, maintenance and other charges, but excluding interest on capital, were 10d. per vehicle mile cheaper than the petrol or steam vehicle. The firm have provided a well-equipped garage for repair work, &c. In the loading of the lorries electric elevators and other mechanical devices are employed, and it has been found possible to finish the daily deliveries over a considerable area in an eight-hour day.

Personal and Appointments.

Mr. T. J. Aitkin has been appointed electrical representative of Dalgleish & Baird, electrical engineers, Riccarton, Kilmarnock.

The engagement is announced of Mr. Trevor F. D. Rose (late R.F.A.) and Miss Irene Hirst, younger daughter of Mr. Hugo Hirst, chairman of the General Electric Company.

Mr. H. T. Kerr is now no longer connected with the City of Hereford Electricity Department, and for the next few weeks his address will be Netherwood, Tupsley, Hereford, where all communications in regard to the West Gloucestershire power scheme should be addressed.

Middlesbrough Electricity Committee has decided to place on record its high appreciation of the services of Mr. R. H. Scotson, the engineer, in connection with the taking over of the electricity supply to the tramways. The chairman (Ald. Calvert) said the work had been carried out with ability and ingenuity. The transference had resulted in Mr. Scotson effecting a saving of a large capital outlay, and an annual saving of at least £600 to the Tramways Department.

The retirement, in May, is announced of Sir William Noble, Engineer-in-Chief to the General Post Office, who succeeded Sir William Slingo in May, 1919. Sir William, who is 61, has passed the retiring age of 60, but is remaining at the Post Office in order to complete three years as Engineer-in-Chief. Sir William Noble entered the service of the Post Office in 1877, and acted as a telegraphist in the Aberdeen office for some years. He was early attracted by the technical side of his work, and, having won medals for telegraphy and telephony, lectured for some years in Aberdeen on those subjects as well as on magnetism and electricity. In 1901 he was made an assistant superintending engineer in the Central Metropolitan District, and, as second in command, he was responsible for a large share of the work of the "telephoning of London." In 1905 he was promoted to a first-class staff engineership, and had charge of the telegraph section at headquarters. In 1907 he became superintending engineer of the Central Metropolitan District, and in 1912 Assistant Engineer-in-Chief. Sir William, who rendered very valuable services on many technical committees, was knighted in 1920. He is a member of the Council of the Institution of Electrical Engineers.

Business Items, &c.

The Electrical Specialities Company are opening a branch at 67, Briggate, Leeds. Mr. Sherwood will be in charge.

Mr. F. G. Titchmarsh, 23, Soho-road, Handsworth, Birmingham, is now representing the Jeary Electrical Company in Birmingham and the Midlands.

The British Thomson-Houston Company have removed from their offices at 83, Cannon-street, to Crown House, Aldwych, London, W.C. 2. Telephone, Regent 8 040.

With a view to increasing the efficiency of their organisation, the Premier Electric Welding Company have decided to concentrate a number of their departments in the London area. Arrangements are being made to transfer the head office, technical and research laboratories, and electrode factory to Abbey Wood, London, S.E. 2, to which address all communications should in future be sent. The telephone is Woolwich 866, and the telegraphic address, "Premelwel, Abwood, London."

Electric Control, Ltd., announce that after April 1 their London office address will be Hastings House, Norfolk-street, Strand, W.C. 2. Telephone, City 2 487; telegrams, "Elecontrol Estrand, London." Information regarding "Empire" automatic control gear for both alternating and direct current, and "Empire" S/C high-tension fuses, may be obtained immediately by communicating with this address. The firm are now acting entirely independently of any other manufacturers of switch gear or control gear.

Exhibition Notes.

Kingston-on-Thames Corporation have arranged to hold an electrical exhibition at the Baths Hall, Wood-street from April 3 to 18 inclusive.

It is hoped that British manufacturers will visit the sixth Swiss Industries Fair, which is to be held at Basle from April 22 to May 2. The following are among the groups of exhibits:—(4) Lighting and heating; (6) inventions and patents; (8) advertising; (18) delicate mechanical instruments and apparatus; (19) electrical industry.

Among the exhibitors of electrical appliances at the National Trades Exhibition, which was opened at Birmingham on Monday, are the City of Birmingham Electric Supply Department, the British Thomson-Houston Company, Callender's Cable & Construction Company, the General Electric Company, Metropolitan-Vickers Electrical Company, and W. S. Vaughan, Ltd.

The Milan correspondent of the "Times Trade Supplement" states that at the International Sample Fair, which will open in Milan early next month, a section will be applied to the display of unregistered inventions, and the space let at a nominal charge. Exhibits will be safeguarded by the Italian law, which gives temporary protection to unregistered ideas. This section will be devoted particularly to improvements in industrial machinery, labour-saving devices, internal-combustion engines, factory equipment, &c. The committee hope that scientific instruments especially will be shown by English manufacturers.

Telegraph and Telephone Notes.

A new telephone call office has been opened at Old Marston, near Oxford.

Guernsey State Telephone Department made a net profit of £811 last year.

Work has at last been begun on Sheffield's new telephone exchange.

An automatic telephone exchange was brought into operation at Devonport Dockyard on Monday.

The report of the Select Committee of the House of Commons on Telephones was laid on the table of the House of Commons on Monday. It is understood that the principal recommendations are: (1) The message rate of charging to be continued, but with an elasticity of application where such would help telephone development, particularly in rural areas; (2) appointment of a director-general and a general administrative board on the Swedish model; (3) telephone administration to be separated from that of mails; (4) improved business methods.

It is hoped that the London-Manchester underground telephone cable will be in operation next month. The cable, which is 183 miles long and contains 160 pairs of wires, is the first trunk cable to be equipped with telephone repeaters, and on that account it has been possible to reduce the weight of the copper conductors to 40lb. per mile. At the outset there will be one temporary repeater station at Leicester. Later two permanent repeater stations will be introduced, at Derby and Fenny Stratford, and when they are working it will be possible to switch right through from London to Liverpool, Leeds, and other places farther north. Under the present system a call between London and Liverpool has to pass through fifty-seven circuits; with the repeater system it is expected that this will be done on one circuit.

Wireless Notes.

Reuter's Paris correspondent states that a wireless telegraph station is being established on the summit of Mont Blanc.

Mr. Wm. Le Queux has consented to become President of the newly-organised Wireless Scientific Society for Reading and District.

It is stated that in order to avoid the erection of competitive wireless stations in Argentina the German Telefunken Company, whose share capital is held half by the Berlin A.E.G. and half by the Siemens and Halske Company, is transferring a portion of its hitherto dominating holding in the Transradio Argentina to the Radio Corporation of America, Marconi's Wireless Telegraph Company, of London, and the Société Générale pour Telegraphie sans Fil. The Transradio Argentina is erecting a large wireless station in the vicinity of Buenos Aires, which it is expected will be brought into service in 1923.

Dealing with the Question of Wireless messages in a lecture on Monday to the students of journalism at King's College, London, on "The Function of the Press in Empire Building," Mr. Percy Hurd said we seemed to be entering upon a fresh clash of nations in the matter of words. It was not a very happy future to contemplate when nations were sending out into the air their own version of current events, to be contradicted, also in the air, by other nations. It would be far better if, when news was carried over the world by the wireless system, it should be scattered by journalists and not by Government officials. Mr. Hurd added, "We want to establish a free wireless."

The council of the Empire Press Union, at a meeting on Tuesday, presided over by Mr. Robert Donald, and attended by many representatives of newspapers at home and overseas, including the president, Viscount Burnham, unanimously adopted the following resolution:—"That this meeting views with anxiety the continued lack of adequate telegraphic communications within the Empire, and records, on behalf of the newspaper Press of the Empire, its deep concern at the prolonged delay in securing the full advantages of inter-Imperial wireless telegraphy; further, it understands that the Post Office scheme does not meet with the approval of the Dominions overseas, and presses H.M. Government, as a matter of urgent importance, immediately to carry out or support such a scheme for establishing an Imperial wireless chain as will obtain general approval throughout the Empire."

Institution Notes.

The Thirteenth Kelvin Lecture will be delivered by Prof. Sir Ernest Rutherford, K.B.E., F.R.S., before the Institution of Electrical Engineers on May 18, instead of on May 11 as previously announced. The subject is "Electricity and Matter."

The North-East Coast Institution of Engineers and Shipbuilders invite all members to communicate suggestions of papers for next session. They are specially invited to offer papers themselves. Those who feel unable to do so are asked to suggest (1) subjects for papers; (2) suitable authors. Replies should be made as early as possible, and before April 30.

The second annual dinner of the North of Ireland Section of the Electrical Power Engineers' Association was held in Thompson's Restaurant, Belfast, on Saturday, when, under the presidency of Mr. J. S. Graham, the members of the section entertained various local gentlemen connected with the electrical industry and representatives from the South of Ireland Section. A varied and excellent musical programme, interspersed with toasts, was thoroughly enjoyed by all present.

Social Notes.

The third social gathering of the season of the SOUTHPORT Electricity Mains Department was held last Thursday, when after a hot-pot supper various members of the staff contributed to a musical programme. Mr. E. Moxon, the borough electrical engineer, who responded to the toast "Our New Chief," spoke of the need of co-operation if the department was to be made a success.

The landowners and farmers in the Amman Valley, over whose land Swansea Electricity Department's new overhead transmission line to the Amman Valley has been erected, were entertained to dinner at the Hotel Metropole, Swansea, on Friday, by CALLENDER'S CABLE & CONSTRUCTION Co., who carried out the work. Mr. G. W. Burr, Swansea Borough Electrical Engineer, presided. The line extends 16½ miles from the sub-station at Manselton, Swansea, to the sub-station at Gelliceidrin Colliery, Brynamman, and there are three transmission lines and an earth line carried on 158 poles. Contracts have already been entered into with three collieries for the consumption of about four million units, and negotiations are proceeding with other collieries. The bulk of the requirements of the Gorseinon Electric Lighting Company will also be supplied by means of this extension.

The BATTI-WALLAH'S SOCIETY, which, in common with other societies and recreative organisations, has met with the prevalent difficulties since the War, held its annual general meeting at the Holborn Restaurant on Monday. A goodly gathering, representing all the different personalities that this lively society includes, was presided over by Mr. W. F. Ireland, the retiring president. Mr. Pooley, who has been the hon. secretary for the past twelve years, and Mr. A. J. Greenly, the hon. entertainment secretary, both very busy men, who have wished to retire, but felt unable to do so while the society's affairs languished, now relinquish their posts. They are succeeded by Mr. M. Whitgift as hon. secretary and Mr. F. G. Batt as hon. entertainment secretary. Mr. Edgar Barralet is the new president, with a strong committee, and it has been resolved that the meetings shall now be recommenced, and an active season is in contemplation.

The CHELMSFORD ENGINEERING SOCIETY held its annual conversazione at the Hoffmann Manufacturing Company's Works on Saturday. The president, Mr. G. F. Barrett, and Mrs. Barrett welcomed the large company of guests, including the Mayor and Mayoress. The society, which has concluded a most successful season of lectures, held for the encouragement of students for whom a competition was arranged. The president's prize was won by Mr. P. Matthams, and Mr. G. H. Johnson's prize by Mr. E. L. Tomalin. The secretary, Mr. Wise, reported a membership of 181, and thanked the Marconi Wireless Telegraph Company, Crompton & Company, and the Hoffmann Manufacturing Company for the use of apparatus and for lectures. A capital musical programme was carried out; experiments and demonstrations were made showing some of the principal processes of the three firms referred to, and in another room there was a cinematograph display illustrating the developments in wireless telegraphy and telephony.

C. and G. Examinations.

In a communication, dated the 17th inst., Mr. Gus. C. Lundberg points out that during the past three years he has in various quarters drawn attention to the fact that after nearly forty years' successful and progressive work, the CITY AND GUILDS EXAMINATIONS in all electrical subjects, Grades I. and II., were cancelled at the instigation of the Board of Education. For some unknown reason the Board felt that such a course was good for the general public, but considered that certain Government employees should not participate in this decision for the common good, and therefore permitted them to carry on as before. Although practically everyone realised the retrograde step the Board had taken, no decided protest was made by either education authorities or the electrical Press. However, it is proposed to reinstate the examination in "electrical installation work," which is to be held on May 2 and 6 next. This is a very satisfactory beginning, and Mr. Lundberg hopes that it will soon be followed by the reinstatement of all the remaining examinations in electrical subjects. The best thanks of the industry must be accorded to the Electrical Contractors' Association for their personal efforts in this matter.

Railway Electrification Proposals.

The scheme for the ELECTRIFICATION of the SUBURBAN LINES of the SOUTH-EASTERN & CHATHAM RAILWAYS has been advanced a stage during the week. As our readers are aware, the S.-E. Company contemplate an expenditure of £5 800 000 on electric traction. The first stage will cover 210 track miles and extends to Orpington, Hayes and Addiscombe-road (Croydon). The second stage will extend to Gillingham, Tonbridge and Dorking, and the third will be mainly sidings in the same areas. The London, Brighton & South Coast Company propose to extend the electrification of suburban lines north of Coulsdon and Cheam, thus adding 300 track miles to the 111 miles already electrified. The full cost of converting the main and suburban lines will be £10 000 000. It is announced that the L. & S.W. Company have withdrawn their objection to the technical scheme of the South-Eastern Company, and the Ministry of Transport have forwarded the electrification proposals to the Trade Advisory Committee, whose early consent is anticipated.

Imperial Notes.

RENMARK (South Australia) Council have decided to invite estimates of the cost of extending their electrical generating plant.

Melbourne Electric Supply Company have applied for an Order authorising them to supply electricity in portions of the shire of BELLARINE (Victoria).

MUSWELLBROOK (N.S.W.) Council are using the accumulated profit on the gas undertaking (£3 000) to meet the cost of establishing electricity supply works.

TINTENBAR (N.S.W.) Shire Council have been compelled to defer consideration of the question of establishing electricity works owing to the present high price of money.

It is stated that on nearly nine thousand farms in NEW ZEALAND the cows are milked by electricity at an annual cost for current of between £25 and £30 per farm.

The erection of the power house at the WANGARATTA (VICTORIA) woollen mills, which will also supply current to the municipal council, has been commenced.

The transmission line being erected by the TASMANIAN GOVERNMENT HYDRO-ELECTRIC DEPARTMENT from Waddamana to Launceston is expected to be completed before next August, and several new factories at Launceston will be ready to take power from the line by the time it is available.

Works at Launceston (Tasmania) have been reopened by Australian White Lead, Ltd., who propose to manufacture a NON-POISONOUS WHITE LEAD by means of the Gitsham-Evershed process, in which an electric furnace is used to vaporise the metallic compounds, atmospheric oxygen is added, and the resulting acids produce the pure white lead. Mr. Gitsham is to be retained as managing director for at least three years.

Machinery and appliances of iron or steel, of a class or kind not made in CANADA, and elevators and machinery, and machinery of floating dredges for use in alluvial gold mining, may be imported free of duty. On electric motors and electrical apparatus, and all machinery not otherwise provided for, and iron or steel integral parts of all machinery specified in this item, there is a British preferential tariff of 15 per cent. and a general tariff of 27½ per cent. *ad valorem*. A sales tax is also levied on the duty-paid value as follows :—2½ per cent. on importations by manufacurers or wholesalers, and 4 per cent. on importations by users or retailers.

Foreign Notes.

It is reported that the Czecho-Slovak Government intends founding a RADIUM INSTITUTE AT PRAGUE.

Efforts are being made to arrange for the development of WATER POWER IN THE DUTCH EAST INDIES in order to provide cheap electric power for industrial purposes. Already plans of some schemes have been prepared, but they are being held up for financial reasons.

There has been an increase in the TAX ON PATENTS IN FRANCE, and in place of 100 frs. a year, 125 frs. must be paid for each of the first five years, 200 frs. for each of the succeeding five, with a fee of 300 frs. for each of the remaining five years of the life of a patent.

THE AMALGAMATION of the Spanish company, Aceros Electro Rapidos, of San Sebastian, with a German (Cologne) combine is announced. The Spanish company owns metallurgical and machinery works, while the German group is engaged in railway wagon and material construction.

Two additional 30 000 kW generating sets are to be installed at the WINDSOR (W. VA.) electricity works of the West Penn Power Company, which also owns stations at Springdale (4 200 kW) and Connellsville (56 500 kW). The new units will bring the total rating of the company's plant to over 180 000 kW.

As the result of a questionnaire recently sent out by the German Metallurgical Society to electricity undertakings using ALUMINIUM as OVERHEAD CONDUCTORS, it is announced that out of fifty-nine replies only eighteen reported deterioration due to corrosion at points where the aluminium was in contact with other metals. In general, aluminium conductors have given satisfaction, though special precautions against atmospheric influences are required at joints. Insulating tape or varnish is usually employed for this purpose.

The Bureau of Standards, Washington, is endeavouring to STANDARDISE AMERICAN DRY-CELL SPECIFICATIONS. At a recent conference of manufacturers and users of batteries, 17 sizes of the larger cells were considered, and 7 were recommended as standard; of 30 different sizes of flashlight batteries 8 were adopted as standard, and 2 sizes were selected for radio apparatus. It is stated that 150 000 000 dry cells are sold each year, and it is considered that the elimination of many of the little-used sizes will result in a considerable saving in the cost of manufacture and a reduction of prices.

The American Railway Express Company, which claims to be the largest user of ELECTRIC TRUCKS in the world, and has at present more than 1 200 of these vehicles in service, has recently given an order for an additional 104 trucks for NEW YORK, PHILADELPHIA, and BUFFALO. Twenty of the trucks are of 5-ton size, for New York; 50 2-ton, for Philadelphia; and 34 of 2- and 3-ton sizes, for Buffalo. For New York the trucks are (according to the "Electrical World") to be on a 24-hour basis, and standardised interchangeable batteries are to be used. Each truck is provided with two storage batteries, and at the end of the first shift the exhausted battery will be removed and a freshly charged one put in its place.

Obituary.

We regret to announce the death of Dr. Geo. B. Mathews, F.R.S., Professor of Mathematics at the University College of North Wales, Bangor, from 1884 to 1896. Dr. Mathews was the author of works on the theory of numbers, algebraic equations and projective geometry, and with Prof. A. Gray he wrote a treatise on Bessel Functions.

The death is announced of Mr. Richard Rice, manager of the Lynn plant of the American General Electric Company. Deceased, who was 59 years of age, joined the company in 1903 as a consultant on steam engineering, and was in charge of the steam turbine department of the works until 1918, when he became manager of the plant.

The death occurred at Newcastle-upon-Tyne on March 21 of Dr. J. T. Merz, vice-chairman of the Newcastle-upon-Tyne Electric Supply Company. Dr. Merz, who was born at Manchester in 1840, at first devoted himself to chemistry, although he was also a mathematician of a high order. But in addition to his other extensive scientific and philosophical work, he was from an early date interested in the development of electrical supply. He was one of the founders of the Newcastle-upon-Tyne Electric Supply Company, established in 1889, of which he was for many years chairman. Dr. Merz was closely connected with and took the deepest interest in the expansion of this company from an electric lighting company into one of the most important power undertakings in the country. He was also, in 1881, a director of the Swan Electric Light Company, the first electric lamp manufacturers in this country. In addition to all his business interests, he also took a close interest in the question of technical education, and was for many years closely associated with the work of the Armstrong College, Newcastle. Among his numerous important literary works, the most notable were "A History of European Thought in the Nineteenth Century," "Religion and Science," and "A Fragment on the Human Mind."

Miscellaneous.

It is proposed to employ the electrolytic process for the production of zinc out of the huge dumps of material at the inactive zinc and lead mines in North Cardiganshire.

A deputation from Edinburgh Electricity Committee visited Glasgow last week and inspected the mechanical soot-cleaning appliances in operation at Dalmarnock Electricity Works.

A disastrous fire broke out in the Galway Electrical Lighting Company's premises in Galway last week. The fire started in the power station machine room, and the building soon became a mass of flame. The damage is estimated at £15 000.

The most imposing architectural feature of the new Waterloo Station, which was opened by the Queen on Tuesday, in the absence, through indisposition, of the King, is the new Victory Arch, in the centre of which is an electrically driven clock, supplied by the Synchronome Company. Over 200 electric dials have been supplied by this company for the station and the adjacent offices.

An examination for first and second class certificates of competency as Manager and Under Manager of Mines will be held on May 24 and 25, 1922, at Edinburgh, Newcastle-on-Tyne, Sheffield, Wigan, Cardiff and Birmingham. The written part of an examination for certificates of qualification as Surveyor of Mines will be held at the same places on May 25. Candidates must, on or before April 2, send their names, stating also the district in which they are employed, to the Secretary, at the Mines Department, 46, Victoria-street, London, S.W. 1, from whom all particulars can be obtained.

A meeting of the British Organising Committee formed in connection with the International Navigation Congress is to be held at the Institution of Civil Engineers this week, when the following, among other subjects, will be considered:—The location and construction of lighthouses and of marks at sea; illuminating apparatus, fog signals; working through the air, under water, or by Hertzian rays; advances made and new principles; the utilisation of tides for the production of power for the working and lighting of ports and for maritime work (working of lock gates, &c.); the improvement of rivers for navigation and the production of power; new types of dame for canalised rivers.

Licenses of right have been granted to Norsk Alkali A/S for patent No. 121 460 (18 135/18) for "apparatus and process for the electrolysis of chlorides and of alkaline metals"; to Peter Ford & Sons, Ltd., and another for Patents Nos. 3 030/15 and 4 289/15 for "a new or improved process and composition for moulding or forming articles such as light reflectors or shades, vases, or the like, or decorative slabs for partitions, wall or ceiling covering or the like"; to C. D. Ehret for Patent No. 123 081 (2 585/19) for "improvements in or relating to apparatus for electric wave transmission, particularly applicable to telephony"; to Splitdorf Electrical Company for patent No. 131 899 (21 067/19) "for operating mechanism for electrical generators and magnetos."

Recent Wills.

Mr. James Copland Glegg, a director of the Aberdeen Electrical Engineering Co., has left, in addition to real estate, personal estate in the United Kingdom valued at £50 840.

Dr. Edward Hopkinson, vice-chairman of the Chloride Electrical Storage Company, a director of Mather & Platt, and past-president of the Institution of Mechanical Engineers, has left estate valued at £141 675 (net personalty £137 904).

Companies' Meetings, Reports, &c.

Newcastle-upon-Tyne Electric Supply.

The report of the Newcastle-upon-Tyne Electric Supply Company for the year to December 31 last shows a profit of £347 219, against £392 643 in 1920. From this has to be deducted £10 000 for "Reserve for plant renewals," leaving £337 219. After adding £13 091, the balance brought in, there is a total available profit of £350 310 (£372 241), against which has been charged interest on debenture stocks, loans, &c., amounting to £106 442, transfer to "reserve for special depreciation and contingencies, other than equalisation of dividends," £50 000, leaving a balance of £193 868, which the directors recommend should be appropriated as follows: In the payment of a dividend of 3½ per cent. on the 7 per cent. cumulative preference shares, making, with the interim dividend of 3½ per cent. paid on September 30 last, 7 per cent. for the year (subject to income tax), £105 000; in the payment of a dividend of 5 per cent. on the 5 per cent. preference shares for the year (subject to income tax), £74 885. The sum of £13 982 10s. remains to be carried forward, against £13 091 last year. The expenditure on plant renewals and improvements during the year amounted to £9 441. The three months' stoppage of the coal mines and the general depression in trade caused a serious reduction in the Company's output, and this, together with a continuance of high labour costs, has materially affected its profits. As a result, the directors are unable to recommend the payment of a dividend on the ordinary shares. The additional capital expenditure on works for the year amounted to £801 862 10s.., and represents power station extensions and addition to the Company's transmission and distribution system. During the year £1 383 109 of first and £850 000 of second mortgage debenture stocks were issued.

Chelsea Electricity Supply.

Comparing the present position of this company with its position in 1913, the chairman, Mr. W. R. Davies, who presided last week at the annual meeting of the Chelsea Electricity Supply Company, said that an immense improvement was shown. The profits had not increased very largely, but the intrinsic position of the company was bettered out of all knowledge. The gross receipts had risen from £72 500 to £120 400, but the costs had gone up from £35 000 to £77 000. The balance of profit, after providing for depreciation, had risen from £17 900 to £24 600, and this notwithstanding that rates, to mention only one item, had risen from £5 874 to £11 196. The improvement in the capital position was even more striking. Nine years ago the debenture stock outstanding was £175 000, but this had been reduced to £89 670. The depreciation fund, notwithstanding they had withdrawn heavy amounts for plant which had been scrapped, had risen from £124 000 to £205 000. In 1920 they dismantled and sold a considerable amount of uneconomical generating machinery, and an agreement had been entered into with the Central Electric Supply Company for a bulk supply to meet all the company's requirements in excess of that provided by the Diesel Plant, which it was intended to continue to use. They had found this plant both economical and reliable, and it was useful to have an oil plant to set off against coal-using plant, so that, whichever form of fuel was the cheaper, they could make use of the plant accordingly. The capital commitments consequent on this bulk supply would amount ultimately to between £35 000 and £40 000, for which they had plenty of funds in hand available. An abstract of the accounts was given in our issue of March 10.

Brompton and Kensington Electricity Supply.

Addressing the shareholders at the annual meeting of the Brompton and Kensington Electricity Supply Company last week the chairman, Mr. H. R. Beeton, who presided, stated that the company had connected more consumers than in any previous twelve months, excepting only last year and the year before. They sold more current per lamp installed than in the previous year, and although the average price was somewhat lower, the gross receipts showed an increase of 7½ per cent. over the record year of 1920. This continued progress was due mainly to the conversion of the larger houses in their area into flats and maisonettes and to the growing use of electrically-operated labour-saving devices, and partly to the reasonable rates at which the company supply electricity for heating and cooking, as well as for lighting. Their new 1 500 kW turbine alternator was installed during the year, but, owing to delay in delivery, they only enjoyed the benefit of it for less than a month By its installation they had provided all the plant likely to be required for a long time. The cost of this and other developments (£39 000) the Company intended to provide entirely out of profits. With regard to the Brompton and Kensington Accessories Company, he could only repeat what he said last year, namely, that its assets continued to be worth their book value, that it constituted one of their best customers, and that its work contributes effectively to the business of supply in their area. Our issue of March 3 contained an abstract of the accounts.

City of London Electric Lighting.

In moving the adoption of the report and accounts at the annual meeting of the City of London Electric Lighting Company last week, Mr. J. B. Braithwaite (the chairman), who presided, said that the receipts from the sale of current and from other sources amounted to £676 455, compared with £649 390 in 1920. The total generating costs were £270 885 (271 604), the distribution costs £303 685 (£311 785). There was, however, an increase of £12 675 in rates and taxes, and also an increase in rents and wayleaves, making an increase of £7 010 in the total expenses and a net

increase of £27 065 in revenue. The reserves now stood at £412 664, showing an increase of £41 000. They naturally hoped last year that they would have a record output this year, but owing to the prolonged coal strike and other factors their actual output was about three-quarters of a million units less. But owing to the economies introduced into the generating station and in other ways, although the output had been less, the profit had been increased, and they hoped that, now that costs of coal and other things were inclined to come down, there would be increased economy this year, which would enable them to do something for their consumers. The new plant was now installed, and they hoped to have it in operation within the next week or two.

British Insulated and Helsby Cables.

The report of the BRITISH INSULATED AND HELSBY CABLES, LTD., for the year ended December 31, 1921, shows a profit for the year (after making provision for estimated liability for Corporation Profits Tax to date) of £502 524. to which has to be added £116 854 brought in, making a total of £619 388. From this sum have to be deducted directors' and debenture trustees' fees and remuneration to works' committee (£9 665), interest on first debenture stock (£22 500), interest on second debenture stock (£10 000), dividend on preference shares to December 31, 1921 (£30 000), interim dividend on ordinary shares to June 30, 1921 (£37 500), which leaves a disposable balance of £509 723, of which the directors have appropriated £30 000 to depreciation and £5 000 to first mortgage debenture stock redemption account, leaving available for dividend a balance of £474 723. The directors recommend the payment of a further dividend of 6¼ per cent. on the ordinary shares, together with a bonus of 5 per cent., making, with the interim dividend already paid, a total distribution of 15 per cent. for the year ended December 31, 1921, which will absorb £112 500 and leave £362 223 to be carried forward. The directors report that, though fully employed during the first half of the year, the factories were not so busy during the second half, and there had recently been a decided diminution in the value of orders received.

Para Electric Railways and Lighting.

The gross receipts of the PARA ELECTRIC RAILWAYS AND LIGHTING COMPANY for the year ended Nov. 30 decreased from £296 898 to £267 310, and operating expenses from £175 032 to £163 891; the difference in exchange rose from £9 741 to £58 796, on account of heavy fall in exchange from the average remitting rate of 14·93d. in the previous year to 8·39d. this year, leaving net revenue at £44 623, compared with £112 124. Adding interest and transfer fees £37, against £5 347, deducting London expenses £4 604, provision for income-tax £11 000, loss on investments £3 322, Debenture interest and sinking fund £38 500, and adding £18 157 brought in, the balance was £5 391, against £81 057, transferred to depreciation and renewals reserve. A further factor which seriously affected the net revenue was the inability of the municipality to pay accounts for public lighting. Interest on sterling Treasury bills held by the company in respect of lighting accounts of previous years remains unpaid, consequently bills have been written down to present market value from reserve created against this contingency. The directors regret that dividends on preference and ordinary shares cannot be paid this year. As preference shares are cumulative, accrued dividends will be paid when possible out of future earnings.

Llanelly and District Electric Lighting and Traction.

The report of the LLANELLY AND DISTRICT ELECTRIC LIGHTING AND TRACTION COMPANY for the year to December 31, 1921, shows available profit, including the balance (£1 341) brought in, of £25 895. Loan and debenture interest, less tax, absorbed £8 326, and after allowing for debenture stock redemption (£1 216) and general reserve (£4 500) there is an available balance of £11 853. Out of this sum dividends amounting to £5 931 have been paid, and the directors further recommend the payment of a dividend on the ordinary shares of 7 per cent. for the year to December 31 last, less tax (£5 449), leaving £473 to be carried forward. Although adversely affected by the coal strike and industrial depression, which was severely felt in the South Wales district, the result of the year's working shows improvement as compared with former years. The power business continues to develop satisfactorily, and the new plant recently intalled is being used to its full capacity. During the year £125 000 7½ debenture stock, 19 760 preference shares and 46 830 ordinary shares were issued to provide funds for capital expenditure incurred to the end of 1921.

Kensington and Knightsbridge Electric Lighting.

The report of the KENSINGTON AND KNIGHTSBRIDGE ELECTRIC LIGHTING COMPANY for the year 1921 shows net profit available for dividend of £18 147, to which £1 857 is brought in from previous year, making a total of £20 014. From this sum has to be deducted £9 700 for dividends already paid during the year, and the directors recommend payment of a further dividend at the rate of 12 per cent. per annum for the last half-year, which will absorb £6 300, making 10 per cent. for the year on the ordinary shares, and leaving £4 014 to be carried forward. The balance of the renewal and reserve fund now stands at £176 525, of which sum £102 540 is the amount expended in excess of capital received, the balance being represented by working capital, investments and cash balances.

The directors of METROPOLITAN-VICKERS ELECTRICAL COMPANY recommend the payment of a dividend on the ordinary shares of 12½ per cent., less income tax, for the year ended December 31, 1921.

RANSOMES, SIMMS & JEFFRIES have passed the dividend on the preference shares.

PHILIPS' LAMPS WORKS, of Amsterdam, announce a dividend of 11 per cent. for 1921.

The WESTERN UNION TELEGRAPH COMPANY have declared a quarterly dividend of 1¾ per cent.

HADFIELDS, LTD., have declared a final dividend of 6d. per share, making 5 per cent. for the year, free of tax.

THE JUTLAND TELEPHONE CO. offered for public subscription this week £500 000 5½ per cent. sterling bonds at £93. The issue was over-subscribed.

HALIFAX & BERMUDAS CABLE COMPANY announce an interim dividend at the rate of 6 per cent. per annum, tax free, for the half-year ending Dec. 31 last.

The STOCK EXCHANGE Committee have ordered 20 000 £1 fully paid ordinary shares of Marconi's Wireless Telegraph Company and 75 571 £1 fully paid ordinary shares of the Cordoba Light, Power & Traction Company to be quoted in the Official List.

THE VICTORIA FALLS AND TRANSVAAL POWER COMPANY'S net earnings for the quarter ended Dec. 31 last, including those of the Rand Mines Power Supply Company, amounted to £205 682, before providing for taxation in South Africa and the United Kingdom.

The profit of the COUNTY OF DURHAM ELECTRICAL POWER DISTRIBUTION COMPANY for 1921 was £60 952, plus £1 274 brought in, making £62 227. A dividend of 11½ per cent. is announced on the ordinary shares for the year, leaving £842 to be carried forward.

In regard to the issue of £1 500 000 7 per cent. debenture stock of the BRITISH THOMSON-HOUSTON COMPANY, allotment letters and scrip certificates should be forwarded to the Company's office, Crown House, Aldwych, W.C. 2, for exchange for definitive certificates.

PRITCHETT & GOLD & E.P.S. COMPANY have declared a dividend of 10 per cent. on the ordinary shares. The sum of £2 000 has been added to the workmen's compensation reserve, and £10 000 to the general reserve, leaving £29 063 to be carried forward, subject to taxes.

The NATIONAL ELECTRIC SUPPLY COMPANY have declared dividends at the rate of 4 per cent. for the year on the preference and 6s. 6d. per share on the ordinary shares for the half-year, making with the interim dividend paid in July, 9s. for the year, and £5 8s. 6d. on the founders' shares.

BIDEFORD AND DISTRICT ELECTRIC SUPPLY COMPANY are offering for public subscription 7 500 7 per cent. preference shares of £1 each and 17 500 ordinary shares of £1 each. The company has not yet been registered, but will be incorporated on the necessary capital being obtained. The issue closes on March 31.

The net earnings of the BELL TELEPHONE OF CANADA for 1921 were $2 276 421, after providing $2 549 715 for depreciation and $595 000 for taxes. Interest charges absorbed $1 168 800, and after providing for a dividend of 8 per cent. a deficiency remains of $776 009. Surplus and reserves stand at $22 501 399.

The accounts for 1921 of the CARMARTHEN ELECTRICITY SUPPLY COMPANY show a profit of £886, to which is added £644 brought forward. The half-year's preference dividends absorbed £252 10s., and the directors recommend that £545 be transferred to the depreciation fund, leaving a balance of £753. Out of this sum they recommend a dividend of 5 per cent. (less income tax) on the ordinary shares, leaving £497 to be carried to next account.

The net profit of BROWETT LINDLEY & COMPANY for 1921, after charging debenture and bank interest, writing off £6 244 for depreciation of buildings, machinery and patterns, and making provision for income tax, corporation tax and contingencies, was £14 059, plus £9 178 brought in, making £23 237. The directors propose a further dividend of 11½ per cent., less tax, on the preference shares (disposing of all arrears), a dividend of 10 per cent., less tax, on the ordinary shares, carrying forward £10 737.

Presiding over the meeting of the HASTINGS AND DISTRICT ELECTRIC TRAMWAYS COMPANY, LTD., Mr. Geo. Kitchin said that the traffic receipts for 1921 had increased by £1 855 and the expenses were £950 less, but power was up by £950 owing to the conversion of two boilers for oil fuel burning. After meeting debenture interest they were able to pay the preference dividend for the year and to wipe out the arrears of 1½ per cent. on those shares. The overhead equipment on the front line had been working very satisfactorily. The company was successful in the appeal against the decision of the arbitrator on the question of the new lamps and cables on the front, and the threatened further appeal by the Corporation had been abandoned.

The Report of the URBAN ELECTRIC SUPPLY COMPANY for the year ended Dec. 31, 1921, states that the balance carried to net profit and loss account amounts to £95 563, as compared with £86 685 in 1920, and after deducting the amounts required for interest, debenture stock, redemption and income tax amounting to £60 856, there is, with £2 163 brought forward from last year, an available balance of £35 869, which the directors recommend should be applied as follows: To reserve for depreciation, £25 000; to dividend for one half-year on the cumulative preference shares, £6 250; to balance to be carried forward, £5 619. The total load connected to the thirteen undertakings of the company is 48 120 kW, compared with 46 882 kW in 1920.

It is stated that a company is being formed at Nairobi, Kenya Colony, called the EAST AFRICAN POWER AND LIGHTING CO., to acquire the undertaking of the Nairobi Electric Power and Lighting Co., Ltd, and other electrical interests in the Colony.

County Court Judgments.

[Note.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

BURGE, Mr. H. J., 8, Fernhead-road, Paddington, master electrician. £10 4s. 11d. Jan. 10.

MITHAM, Mr. D., Terrace-road, Walton-on-Thames, electrical contractor. £23 1s. 3d. Jan. 6.

REYNOLDS, Mr. W. A., 2, Aldgate East-chambers, Aldgate, electrical engineer. £33 1s. Jan. 13.

THURLOW WHOLESALE ELECTRIC SUPPLIES, LTD., (trading as Herberts), registered office, 337, Norwood-road, S.E. £16 6s. 11d. Jan. 14.

Deeds of Arrangement.

CARTER, William Henry, trading at Manchester and Salford, and residing at 30, Thomas-street, Cheetham Hill, electrical engineer. Trustee, L. Taylor, 4, St. Ann's-square, Manchester. Liabilities unsecured, £639; assets, less secured claims, £67.

KNIGHT, Wilfred Lempriere, trading as W. L. KNIGHT & SONS, 6, Oak-end-waye, Gerrard's Cross, electrical engineer and contractor. Trustee, W. A. J. Osborne, 119, Finsbury-pavement, E.C. Liabilities unsecured, £850; assets, less secured claims, £525.

Mortgages and Charges on Limited Companies.

[Note.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

B. E. MANUFACTURING COMPANY, LTD., London, E.C., electrical apparatus manufacturers. Registered March 7, £3 000 debentures, present issue £2 350; general charge. *——. June 29, 1920.

WOKING ELECTRIC SUPPLY COMPANY, LTD. Registered March 7, £110 debentures, part of amount already registered. *£64 170. June 25, 1921.

Satisfaction.

DUBILIER CONDENSER COMPANY, LTD. (late DUBILIER ELECTRICAL SYNDICATE LTD.), London, W. Satisfaction registered March 9, £20 000, registered Feb. 23, 1920.

Private Meetings.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

PITKIN, JAMES, & COMPANY, LTD., 28, Hatton-garden, E.C., scientific instrument makers. A meeting of creditors was held at 28, Hatton-garden, E.C., to consider a scheme of arrangement proposed between the company and the unsecured creditors. An informal conference of the principal creditors was held in January last, and the creditors had been requested to agree to a scheme by signing a form accepting immediate part payment. The great majority of the creditors had accepted, but the present meeting had become necessary in order to get formal approval. The necessity for the scheme had arisen entirely through the Aladdin Renew Electric Lamp Corporation, Ltd., having failed to pay a large sum of money owing to the company. The Aladdin Company, it was alleged, ordered a number of machines involving thousands of pounds, and refused to take delivery and pay for more than a small proportion. The protection of the court was sought, but by the time the final judgment in Pitkin's favour was obtained the Aladdin Company went into liquidation. The verdict was for £3 400 and costs, totalling over £4 000, and of this sum only £1 100 was obtained. Under the scheme now proposed at least 5s. in the £ would be paid promptly, and it was confidently hoped that a further sum would be paid, assuming the company could carry on business and dispose of its stock and assets.

SEMCO, LTD. (in voluntary liquidation), electrical engineers, 19, High-street, Shoreditch, London, E. At a meeting of creditors held last week Mr. F. B. Darke, the liquidator of the company, submitted a statement of affairs which showed liabilities of £5 952. After allowing £155 for preferential claims, the assets were estimated to realise £2 583, or a deficiency as regarded the creditors of £3 369. Mr. Darke reported that the company was registered on Sept. 10, 1919, to acquire a business from the Standard Electrical and Maintenance Company. The goodwill was valued at £2 000. In the twelve months to Aug. 31, 1920, there was a loss on the trading of £870, the turnover being approximately £19 000. In the following year the turnover was £19 555, and there was a loss on the trading of £4 780 accounted for chiefly through unremunerative contracts and the electrical strike. In addition the company opened a foundry at Forest Gate, on which money was lost, and it had since been closed down. The company also lost on the manufacture of the Semco Sparking Plugs. In answer to questions, it was stated that the issued capital of the company was £6 200, of which £2 200 was issued for cash. The company had carried out a substantial contract for the Islington Borough Council, and work to the extent of about £2 000 remained to be completed. It was a profitable contract to complete. A resolution in favour of the voluntary liquidation of the company being continued with Mr. Darke as liquidator was carried unanimously, and an informal committee was appointed consisting of the representatives of the General Electric Company, Phœnix-Tester, Ltd., and the Cable Accessories Company. The principal creditors are: B. T.-H. Electric Lamp Company, £327; Metallic Electrical Engineering Company, £115; General Electric Company, £104; Metropolitan-Vickers Electric Company, £64; Vulcan Electric Company, £81; Phœnix-Tester, Ltd., £82; Cable Accessories Company, £99; Wholesale Fittings Company, £75.

London Gazette.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

Companies Winding-up Voluntarily.

BRITISH SWITCHGEAR, LTD. T. D. Marshall, of 10, Bush-lane, Cannon-street, London, appointed liquidator.

ELECTRIC BRASS WARES, LTD. T. Edgar A. Killip appointed liquidator. Meeting of creditors at 21, Tempest Hey, Liverpool, on Tuesday, March 28, at 3 p.m.

MIDLAND ELECTRIC COMPANY (SOUTHPORT), LTD. W. F. Brown, of Southport, and J. A. Bond, of Southport, appointed joint liquidators. Meeting of creditors on Monday, March 27, at 3 p.m., at the offices of Davies & Crane, Hoghton Chambers, Hoghton-street, Southport. Particulars of claims by April 30 to the liquidators.

Notice of Dividend.

BAKER, Reginald Percival, and STUBBS, Frederick Clarence, trading together in co-partnership as the SHEFFIELD ELECTRIC CONSTRUCTION COMPANY, at 124, Pond-street, Sheffield. Amount per £, 4s. 10½d. First and final. Payable, March 22, 14, Figtree-lane, Sheffield.

Notices of Intended Dividends.

MATHERS, Ernest Edward, 10c, High-street, Doncaster, electrical engineer. Last day for receiving proofs, April 5. Trustee, L. J. Clegg, 14, Figtree-lane, Sheffield.

WILLCOX, Albert John, The Garage, Farnham Common, Bucks, electrical, &c., engineer. Last day for receiving proofs, April 5. Trustee, F. W. Davis, 28, Theobald's-road, Bedford-row, London, W.C. 1.

WOLLMAN, Harry Michael, late 9, Greasbro'-road, Parkgate, near Rotherham, Co. York, electrical factor. Last day for receiving proofs, April 3. Trustee, L. J. Clegg, 14, Figtree-lane, Sheffield.

Partnerships Dissolved.

BARCHAM, Constance Wormald, and EDWARDS, Christophe, manufacturers and repairers of electrical accessories, &c., at 29, Portman-mews South, London, under the style of EDWARDS & BARCHAM, by mutual consent as and from Feb. 3, 1922.

ROLLINSON, Joseph Ernest, and GREENSMITH, Ernest Joseph, electrical engineers, at Tavistock Chambers, Beastmarket Hill, Nottingham, under the style of ROLLINSON & GREENSMITH, by mutual consent as from Feb. 12, 1922. Debts received and paid by J. E. Rollinson.

Bankruptcy Proceedings.

BARRETT, Bernard, electrical engineer, 104, Whitechapel-road, E. A general meeting under the receiving order made against this debtor was held last week to enable the creditors to appoint a trustee. A statement of the debtor's affairs showed gross liabilities £2 203, of which £1 475 was expected to rank for dividend, against assets valued at £1 146. The debtor began business in 1911, and in May, 1920, after spending £800 on plant and machinery, he began to manufacture electric switchboards. Owing to foreign competition this venture proved a failure, and in January last he sold the whole of the plant and machinery for £400, which he applied in payment of certain debts. He continued as an electrical engineer, and in March last was joined by two partners, who each provided £250 capital. A branch shop was opened at 17, Maddox-street, W., under the style of the Regent Electrical Installation Company, but in July last the partnership was dissolved and a receiver was appointed at the instance of his partners. He afterwards traded on his own account as an electrical engineer at 104, Whitechapel-road, until September last, when he sold the business to a company of which he became managing director. Debtor valued his interest in the late partnership at £781, and had returned it as an asset to realise that amount. The creditors appointed Mr. William Osborne, of Balfour House, Finsbury-pavement, as trutee of the estate.

HALLETT, Graham Moore, 7, King-street, Frome, Somerset, electrical engineer. The receiving order in this matter was made on March 7, on debtor's own petition. The statement of affairs shows liabilities of £881, while net assets are estimated to realise £358, a deficiency of £523. Debtor attributes his failure to loss on contracts through lack of experience in estimating, depreciation of stock through falling market, and bad trade. He commenced business at 7, Alexandra-road, Frome, in April, 1919, with £65 capital. In November, 1920, the business was removed to his present address. Debtor became aware of his position in December last. A fair set of books has been kept.

LIDDELL, Robert Henry (trading as LIDDELL & McINNES), 4, The Crescent, Carlisle, electrical engineer. The receiving order in this matter was made on Feb. 21 on debtor's own petition. The statement of affairs shows gross liabilities of £359, of which £333 is expected to rank for dividend, and there is a deficiency of £181. Debtor attributes his failure to bad trade ever since the coal strike, and tendering for contracts at too low a price, partly to keep on his workmen. It appears that he commenced business shortly after the armistice, going into partnership with another. This partnership was dissolved in April, 1919, debtor receiving £125 as his share. Later in the same year he started at his present address in partnership with a relation, but this was dissolved in February or March, 1921. Debtor had no capital on starting the last partnership, but his partner brought in £370, of which only £231 had been repaid. Debtor became aware of his position in April last year.

New Companies.

Dalgetti Electric.

DALGETTI ELECTRIC, LTD. (180 308). Private company. Reg. March 14. Capital, £500 in £1 shares. Electrical engineers for dealing in all contracts and sales of electrical fittings and materials pertaining thereto, &c. First directors: W. E. L. Bury, R. H. Limming and J. G. White. Registered office, 10, Conduit-street, W.

Elite Electricians.

ELITE ELECTRICIANS, LTD. (180 386). Private company. Reg. March 17. Capital, £2 000 in £1 shares. To carry on business as indicated by the title. Subscribers: E. H. Lewis and F. S. Munn. Solicitor: C. Crowther, 23, Abingdon-street, Westminster.

London Lamps.

LONDON LAMPS, LTD. (180 314). Private company. Reg. March 14. Capital, £500 in £5 shares. Manufacturers of and dealers in electrical and other lamps and apparatus, &c. Subscribers: G. C. Walsh and J. Mackay. Secretary: J. Mackay. Registered office: 69, Hatton-garden, E.C. 1.

London Radio College.

LONDON RADIO COLLEGE, LTD. Private company. Nominal capital, £2 000 in £1 shares. To establish schools for instruction in radio telegraphy or telephony or other methods of inter-communication, &c. Subscribers: A. E. Fournier and J. Ball. Solicitors: Amery-Parkes & Co., 12, Fleet-street, E.C. File number, 120 296.

Lelios Lamp Co.

LELIOS LAMP CO., LTD. (180 339). Private company. Reg. March 15. Capital, £2 500 in £1 shares. To acquire the business of A. de Jong carried on at St. Andrew's House, 32-4, Holborn-viaduct, E.C. 1, and to carry on the business of electricians, electrical engineers, manufacturers of, dealers in and agents for all kinds of electric lamps, &c. Subscribers: W. J. Woodhouse and S. Groves. Registered office: 32-4, Holbornviaduct, E.C.

Perfecta Electric.

PERFECTA ELECTRIC, LTD. (180 298). Private company. Reg. March 13. Capital, £1 000 in £1 shares. To acquire "The Perfecta Cinema Shutter" from the patentee, J. H. Greenfield, and to carry on the business of cinema, theatrical and general maintenance work, electricians, mechanical engineers, &c. Permanent directors: J. T. Hall, J. H. Greenfield and A. G. Hides. Solicitor: J. Baker, 29, Bank-street, Sheffield.

Ride & Bell.

RIDE & BELL, LTD. (180 401). Private company. Reg. March 17. Capital, £10 000 in £1 shares (9 000 ordinary and 100 founders'). Electrical and water engineers, &c., and to adopt an agreement with Ernest Newell & Co., Ltd. First directors: J. A. Ride, G. Bell and E. Newell. Registered office: Misterton, Notts.

Serck Tubes.

SERCK TUBES, LTD. (180 353). Private company. Reg. March 15. Capital, £1 000 in £1 shares. Tube makers, general, mechanical, electrical and water supply engineers, &c. Subscribers: P. O. Serck and H. Ashford. Solicitors: Speechly, Mumford & Craig, 10, New-square, Lincoln's Inn, W.C. 2.

Welsteads, Ltd.

WELSTEADS, LTD. (180 359). Private company. Reg. March. 15. Capital, £1 000 in £1 shares. Motor, electrical and general engineers, &c. Subscribers: C. F. Welstead and F. T. Shearcroft. Directors: C. F. Welstead and Agnes Welstead. Registered office: 27, New-road, Richmond, Surrey.

Workington Electric Power.

WORKINGTON ELECTRIC POWER CO., LTD. (180 361). Private company. Reg. March 15. Capital, £25 000 in £1 shares. Manufacturers and suppliers of electrical energy, &c. First directors: S. Kelly, Mrs. M. Kelly, S. Moss and T. S. Durham. Secretary: W. Addison. Solicitor: O. F. Ormrod, Whitehaven, Cumberland.

York Shipley.

YORK SHIPLEY, LTD. (180 377). Private company. Reg. March 16. Capital, £10 000 in £10 shares. Mechanical, electrical and general engineers and contractors, &c. Provisional directors: J. B. Farish and R. C. Bolton. Solicitors: Bristows, Cooke & Carpmael, 1, Copthall-buildings, E.C.

PROSPECTUS.

Bideford and District Electric Supply.

BIDEFORD AND DISTRICT ELECTRIC SUPPLY COMPANY, LTD. Prospectus of a company to be formed to acquire the benefit of two agreements entered into by S. I. Knill, of Barnstaple, sanctioning the construction of work for the supply of electricity in Bideford and Northam, &c. Capital, £25 000 in £1 shares (7 500 7 per cent. preference and 17 500 ordinary). Proposed directors: Major W. Ascott; E. W. S. Bartlesse, J. U. Fulford, J. N. A. Houblon, Sir Robert M. Hyslop, H. N. G. Stuceley and G. C. Smyth-Richards. Engineers and contractors: Crompton & Co., Ltd., London and Chelmsford. Solicitors: Hole, Seldon & Ward, Bideford. Secretaries and office (*pro tem*): Robert and Richard Blackmore, Alexandra House, The Quay, Bideford.

Damage to the extent of about £700 has been caused by a fire at the premises of SMITH & GILL, electrical engineers, of Nelson, Lancs. The outbreak was caused by the fusing of an electric wire and the subsequent ignition of a number of accumulators. The stock was destroyed before the arrival of the fire brigade.

Tenders Invited and Accepted.

UNITED KINGDOM.

West Derby Guardians. March 27.—Electric supplies, engine packings, &c., for three months. Particulars from the Clerk, Brougham-terrace, Liverpool.

Belfast District Asylum, Purdysburn. March 27.—Three or six months' supply of electrical fittings, oils, &c. Forms of tender from the Clerk to the Committee, Saintfield-road, Belfast.

London County Council. March 27.—Wiring and fitting Stamford Hill Stores Depot, Portland-avenue, N. 16. Specification from the Chief Engineer, 19, Charing Cross-road, W.C. 2.

Kettering Electricity Committee. March 27.—Two-feeder cables. Specification, &c., from the Engineer and Manager, Electricity Works, Kettering.

Belfast Guardians. March 28.—Renewal of wiring in Nurses' Home and other works. Form of tender, &c., from the Clerk, at the Workhouse.

Hove Corporation. March 31.—Low-tension feeder switchboard. Specification, &c., from the Engineer and Manager, Electricity Works, Davigdor-road, Hove.

Wigan Corporation. April 3.—Circulating water conduit, engine foundations, &c. Particulars from Mr. R. B. Donald, Municipal-buildings, Library-street, Wigan.

Bedford Corporation. April 5.—Supply of e.h.t., h.t., and l.t. underground cables for one year. Specification from the Borough Electrical Engineer.

Corporation of Douglas (Isle of Man). April 10.—Six miles l.t. three-core lead-covered and armoured cable. Particulars from Handcock & Dykes, 11, Victoria-street, London, S.W. 1.

Loughborough Electricity Department. April 14.—Extra high-pressure switchgear and extensions to d.c. switchgear. Particulars from Mr. C. H. Wordingham, 7, Victoria-street, Westminster, London, S.W.; or 11, Mosley-street Manchester.

Hull Guardians.—Extension of wiring at Anlaby-road Institution. Specification, &c., from the Clerk, 182, Anlaby-road, Hull.

INDIA.

High Commissioner for India. March 31.—Electric cable. Particulars from the Director-General, India Store Department, Belvedere-road, Lambeth, London, S.E. 1.

High Commissioner for India. April 7.—(*a*) Cells, electric, inert; (*b*) cells, Leclanche, and spare parts. Particulars from the Director-General, India Store Department, Belvedere-road, Lambeth, S.E. 1.

SOUTH AFRICA.

Municipal Council of Johannesburg. April 12.—*Supply and delivery of six (or more) h.t. metal cubicles suitable for 3 000-3 300 V two phase, 50 cycles, 200 A normal working load, and for, alternatively, similar equipment for 500 A. (Contract 887.) Fifteen miles 0 000 S.W.G. (0·4 in. diameter) round section hard-drawn trolley wire of a conductivity not less than 98 per cent. Mathieson's standard on stout wooden drums, each containing half-mile of wire. The drums are to have a hole 3 in. in diameter through centre for mounting on bar for rolling off. Tenders are to be based on electrolytic copper at £69 per 2 240 lb.

Rand Water Board. May 5.—*Two-ton overhead travelling crane, machine tools, electric motors, &c., for the Board's Vereeniging and other pumping stations; also two portable electric grinders and four electric drills. All the power-driven plant is to be equipped with individual electric motor drives. The electricity available for driving the machine tools, &c., will be 3-phase current at 500-550 V, 50 cycles per second. (Reference D.O.T. 8148/E.D./P.N.)

Dover Town Council has accepted the tender of Mr. J. Martin for electric wiring at the Isolation Hospital at £103 3s.

Warrington Corporation have accepted the tender of the British Thomson-Houston Company for main e.h.t. switchboard extension.

Bradford Corporation have accepted the tender of the Kirkstall Forge Company for front and rear axles for railless electric vehicles.

Berkshire County Mental Hospital Committee has accepted the tender of Mr. Wheeler for the reinstatement of the electric wiring at the hospital at £5 862 6s. 10d.

Metropolitan Asylums Board have accepted the tender of the Chloride Electrical Storage Company for a battery for an electric vehicle at Queen Mary's Hospital, at £219.

The French Thomson-Houston Co. is reported to have obtained an order for 1 000 dynamos for the French State Railway, these being required in connection with the lighting arrangement of local trains.

Burton-on-Trent Corporation have accepted tenders for electricity works extension amounting in the aggregate to £78 726. The largest tender was that of Babcock & Wilcox, Ltd., for boilers, at £40 180.

Glasgow Corporation has been recommended to accept the tenders of the British Thomson-Houston Company for five sets of rotary converters and transformers, £36 283; Ferguson, Pailin, Ltd., for switchboards, £2 422; and British Insulators & Helsby Cables for insulated bolts for tramway purposes.

---

* *Particulars from the Department of Overseas Trade.*

Arrangements for the Week.

FRIDAY, March 24th (to-day).

Physical Society of London.

5 p.m. At the Imperial College of Science, South Kensington, S.W. Guthrie Lecture, "The Effect of Electric and Magnetic Fields on Spectral Lines," by Prof. N. Bohr, of the University of Copenhagen.

Electrical Power Engineers' Association.

7 p.m. At the Institution of Electrical Engineers, Savoy-place, London, W.C. Lecture on "Electric Control of Large Amounts of Power," by Dr. C. C. Garrard.

North-East Coast Institution of Engineers and Shipbuilders.

7.30 p.m. In the Lecture Theatre of the Library and Philosophical Society, Westgate-road, Newcastle-on-Tyne. Paper on "Standardisation: Its Fundamental Importance to the Prosperity of our Trade," by Mr. C. le Maistre. The nomination of candidates for the Council will also take place.

SATURDAY, March 25th.

Royal Institution of Great Britain.

3 p.m. At the Institution, Albemarle-street, Piccadilly, W. 1. Lecture IV., "Radioactivity," by Sir Ernest Rutherford.

MONDAY, March 27th.

Institution of Electrical Engineers.
North-Eastern Territorial Centre.

7.15 p.m. At Armstrong College, Newcastle-on-Tyne. Paper on "Protective Apparatus for Turbo-Alternators," by Mr. J. A. Kuyser.

Royal Society of Arts.

8 p.m. At John-Street, London, W.C. Lecture on "The Constituents of Essential Oils," by Mr. G. Radcliffe.

TUESDAY, March 28th.

Institution of Electrical Engineers.
East Midland Sub-Centre.

6.45 p.m. At the College, Loughborough. Paper on "The Future Aspect of Power Generation," by Mr. A. H. Seabrook.

Institution of Electrical Engineers.
North Midland Centre.

7 p.m. At the Metropole, Leeds. Paper on "Protective Apparatus for Turbo-Alternators," by Mr. J. A. Kuyser.

Junior Institution of Engineers.
North-Eastern Section.

7 p.m. At Armstrong College, Newcastle-on-Tyne. Paper on "Utilisation of Waste Heat," by Mr. G. H. Martin.

Institution of Electrical Engineers.
North-Western Students' Centre.

7.30 p.m. Houldsworth Hall, Deansgate, Manchester. Address by Mr. W. Walker, the Chairman of the Centre.

Illuminating Engineering Society.

8 p.m. At the Royal Society of Arts, John-street, London, W.C. Discussion on "The Lighting of Public Buildings; Scientific Methods and Architectural Requirements."

THURSDAY, March 30th.

Institution of Electrical Engineers.

6 p.m. At Savoy-place, London, W.C. Paper on "Applications of Electricity to Agriculture," by Mr. R. Borlase Matthews.

FRIDAY, March 31st.

Institution of Mechanical Engineers.

6 p.m. At the Institution, Storey's-gate, St. James's Park, S.W. Extra General Meeting. Paper on "The Milling of Screws, and other Problems in the Theory of Screw-Threads," by Prof. H. H. Jeffcott.

Institution of Electrical Engineers.
London Students' Section.

7 p.m. At Savoy-place, London, W.C. Address by the President, Mr. J. S. Highfield.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, Westminster, S.W. Lecturette on "The Steel-melting Shop," by Mr. D. P. Dickinson.

Dictionary of Applied Physics.

Macmillan & Company announce that the first volume of "The Dictionary of Applied Physics," edited by Sir Richard Glazebrook, will be published this month. Succeeding volumes will appear at intervals of from two to three months, it being expected that the publication of the work will be completed before the end of the year. The work is arranged in five volumes, as follows:—Vol. I., Mechanics—Engineering and Heat; Vol. II., Electricity; Vol. III., Meteorology, Metrology and Measuring Apparatus; Vol. IV., Optics, Sound and Radiology; Vol. V., Metallurgy and Aeronautics. Produced under the editorship of Sir Richard Glazebrook and written throughout by experts, it would be difficult to over-estimate the importance of "The Dictionary of Applied Physics." It is the first attempt which has been made to bring within the compass of a single work the latest results of research and the most approved methods in all branches of the subject. It constitutes, therefore, a unique work of reference, containing a mine of information which must prove invaluable, not only to those engaged in educational work, but also to all manufacturers who are vitally concerned with the question of physics as applied to industry. The price of each volume is 63s. net, but orders for the complete set of five volumes will be accepted through a bookseller at the price of £14 14s. net, payable in advance.

Patent Record.

SPECIFICATIONS PUBLISHED.

The following abstract from some of the specifications recently published have been specially compiled by MESSRS. MEWBURN, ELLIS & Co., *Chartered Patent Agents, 70 and 72, Chancery-lane, London, W.C.*

COMPLETE SPECIFICATIONS.

144 305 GUINET, L. Vacuum tubes. (26/12/18.)
144 720 BREISIG, F. System fo the conversion of continuous or direct currents into alternating currents. (11/3/19.)
145 030 SIEMENS-SCHUCKERTWERKE. Metal vapour elcctric discharge apparatus. (18/6/18.)
146 122 SIEMENS & HALSKE AKT.-GES. Telegraphic reception. (27/9/18.)
146 991 WESTERN ELECTRIC Co., LTD. Telegraphic ciphering and deciphering mechanism. (9/12/18.) (Addition to 146 520.)
147 555 TELEGRAPHON GES. Telephonographs. (17/7/19.)
168 925 MACRORIE, A K., AIREY, H., & MORRIS-LONG, S. H. Wireless reception, and particularly methods and means whereby the direction of the incoming waves can be determined. (16/3/20.)
168 935 BRITISH THOMSON-HOUSTON Co., LTD., & SHUTTLEWORTH, N. Electric motor control. (15/4/20.)
168 936 COPE, H. A. (Haefely et Cie., Akt.-Ges., E.). Dynamo-electric machines. (20/4/20.)
168 944 HOUSTON, R. C. Secondary or storage batteries. (10/5/20.)
168 947 BRITISH THOMSON-HOUSTON Co., LTD. (General Electric Co.). Methods of and means for producing alternating currents. (10/5/20.)
168 954 MARCEL'S PERMANENT, LTD., & KERKA, F. Electric heating apparatus for waving or curling the hair. (13/5/20.)
168 955 WATKINSON, J., FRANCIS, N. C., & QUENNELL, A. E. Resistance switches for controlling the intensity of electric currents. (13/5/20.)
168 964 SCHOLES, G. H., & CLAREMONT, E. A. Tool for electric cable stripping. (3/6/20.) (Addition to 149 739.)
168 965 BERRY, F. E. Reactance or choke coils. (4/6/20.)
168 966 NOTTAGE, W. H. Land line and wireless telephony. (5/6/20.)
168 967 WESTERN ELECTRIC Co., LTD. (Western Electric Co. Inc.). Method of signalling in systems generating high-frequency oscillations. (7/6/20.)
168 989 DOOLEY, J. Handle for electric arc welding. (11/6/20.)

APPLICATIONS FOR PATENTS

January 12, 1922.

1 002 A. E. KNOWLES. Electrolyic cells.
1 004 R. AMBERTON. Electricity meters.
1 026 B. T.-H. Co. (G. E. Co.). High-frequency signalling systems.
1 027 METROPOLITAN-VICKERS ELECTRICAL Co., R. BROOKS & N. E. NORTH. Electric railway motor equipments.
1 029 A. BUCK. Connector for electric wires.
1 046 AUTOMATIC TELEPHONE MANUFACTURING Co. & HUDD. Indicating devices for electric signalling systems.
1 050 F. H. LARNDER. Grapnels for submarine cables.
1 065 and 1 066 W. A. TESTER & S. THOMPSON. Power supply controlling means of a.c. motors.
1 067 GES. FÜR DRAHTLOSE TELEGRAPHIC. Wireless telephone transmitters. (13/1/21, Germany.)
1 070 J. E. POLLAK (Siemens & Halske Akt. Ges.). Telephone systems.

January 13, 1922.

1 093 H. LOMATH. Electric conduit box.
1 110 A. HICKMAN. Electric lamp for police lanterns.
1 152 F. G. PARKS. Electric lighting device.
1 126 R. BOSCH AKT. GES. Electric starters for heavy oil engines. (17/1/21, Germany.)
1 129 R. BOSCH AKT. GES. Electric ignition apparatus. (14/2/21, Germany.)
1 137 RANSOMES & RAPIER & P. D. IONIDES. Electric vehicles.
1 149 L. G. DE KERMOR. Regulation of heat generated by electricity.
1 151 L. G. DE KERMOR. Self-regulating electric-steam generators.
1 158 H. ZANGERS. Electro-magnetic releasing device. (24/1/21, Germany.)
1 167 E. GRANAT. Electric distant control apparatus. (14/1/21, France.)
1 170 R. H. BARBOUR. Electricity meters.
1 171 B. T.-H. Co. (G. E. Co.). Switches.
1 190 C. BOURGEOIS. Electric warp stop motion.
1 203 J. W. HALL. Magnetic clutches.
1 207 J. T. ROBIN. Incandescent lamps.
1 208 T. N. WHITEHEAD. Electro-magnetic compasses.
1 209 T. N. WHITEHEAD. Electric relays.
1 212 BRITISH ELECTRIC TRANSFORMER Co., HUBER & ROOTHAAN. Transformers.
1 215 AUTOMATIC TELEPHONE MANUFACTURING Co. Telephone systems. (23/2/21, U.S.)

January 14, 1922.

1 216 A. M. TAYLOR. Electric power transmission systems.
1 218 H. W. SULLIVAN. Submarine telegraph cables.
1 230 R. AMBERTON & R. H. BARBOUR. Electricity meters.
1 235 E. POLLOCK. High-frequency telephone systems.
1 239 A. J. CHEYNE. Electric terminal.
1 253 O. FRICK. Electric induction furnaces. (15/1/21, Sweden.)
1 270 W. S. SMITH. Electric conductors.
1 279 METROPOLITAN-VICKERS ELECTRICAL Co. & D. R. DAVIES. Switches.
1 281 CHAMBERLAIN & HOOKHAM, LTD. & JAMES. Electric current meters.

January 16, 1922.

1 326 G. P. GRENFELL & J. ROBINSON. Wireless navigation apparatus.
1 327 C. B. WARDMAN. Telephone apparatus and installations.
1 339 F. W. HAMPSHIRE. Means for audibly signalling upon sounds being reproduced in a telephone receiver.
1 345 C. SAUNDERS, L. EBELMAN, & F. E. PRATT. Electric rheumatic spring foot support.
1 356 METROPOLITAN-VICKERS ELECTRICAL Co. Insulating sheet materials. (26/1/21, U.S.)
1 360 T. LENAGHAN. Automatic telephone systems.
1 363 NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABR. Gasfilled electric discharge tubes. (10/2/21, Holland.)
1 364 J. H. RUNBAKEN & W. TORRANCE. Commutators or current distributors of electric ignition systems.
1 381 A. H. HUNT. Combined electric lamp holder and switch for vehicle lamps.

January 17, 1922.

1 392 V. A. KELLER. Automatic switches for control of current.
1 394 W. M. EDWARDS. Portable electric apparatus for attachment to domestic baths.
1 432 DRAKE & GORHAM & A. H. ST. C. WATSON. Combination of dynamo-electric machines to maintain constant loads on water wheels, turbines, &c.
1 435 J. W. HALL. Electro-magnetic clutches.
1 442 V. J. HINKLEY. Variable electric condensers.
1 458 METROPOLITAN-VICKERS ELECTRICAL Co. & E. A. BINNEY. Control of electric motors.
1 459 METROPOLITAN-VICKERS ELECTRICAL Co. & J. P. CAMPBELL. Air connections for electro-magnetically actuated valves.
1 460 & 1461 METROPOLITAN-VICKERS ELECTRICAL Co. & W. A. COATES. Switchgear.
1 463 R. HANSEN. Wireless signalling systems.
1 476 G. & J. OLDHAM. Portable electric lamps.
1 481 T. S. & T. H. S. JONES. Electric organ actions.
1 488 SIEMENS-SCHUCKERTWERKE. Electrical commutator machines. (17/1/21, Germany.)
1 500 J. R. WEST. Electric alarm signals, &c.
1 503 J. B. BOWER. Joints or couplings for electric conduits.
1 504 O. T. BANKS. Electric candle lamps.
1 506 S. L. PRICE. Incandescent lamps.

January 18, 1922.

1 509 A. M. TAYLOR. Elimination of currents in lead sheathings of cables.
1 512 G. S. HYNES. Device for preventing theft of electric vehicles.
1 568 RADIO COMMUNICATION Co. & J. SCOTT-TAGGART. Wireless telegraphy, &c.
1 574 H. G. MATTHEWS. Photographic sound recording and light telephony.
1 583 GES FÜR DRAHTLOSE TELEGRAPHIE. High frequency telephony. (11/2/21, Germany.)
1 599 V. MARTINETTO. Automatic maximum and minimum current circuit breakers. (15/3/21, Italy.)

January 19, 1922.

1 609 VERITYS, LTD. & F. W. THORPE. Bulb and reflector fittings of electric lanterns, &c.
1 610 E. A. CLAREMONT & G. H. SCHOLES. Electric fuse box.
1 611 F. H. EELES. Thermal switches or automatic cut-outs for incandescent lamps.
1 621 F. C. TIPPING. Electric signalling devices.
1 628 E. J. QUINN. Signal transmitting device for wireless, flashlight, and land line telegraphy.
1 648 A. C. SMITH. Spring contacts for electric switches, fuse holders, &c.
1 651 SIEMENS BROS. & Co. & H. G. WOOD. Electric fuses, cut-outs, &c.
1 655 R. TILLEY & W. T. WILKINSON. Electric lighting on motor vehicles.
1 661 METROPOLITAN-VICKERS ELECTRICAL Co. & J. P. CAMPBELL. Electric ship propulsion systems.
1 666 W. S. GRAFF-BAKER. Electric relays, &c.
1 677 W. SECK. Electric horns, &c.
1 700 A. T. PADMORE. Dimming switches.

January 20, 1922.

1 704 D. MACADIE. Coil winding machines.
1 707 H. J. CAREY. Electrically operated trucks.
1 714 CALLENDER'S CABLE & CONSTRUCTION Co. & C. W. KAY. Fault localisation for underground cables.
1 717 BROOKES, WARD, & Co. & G. BROOKES. Suspension chains for electric light fittings.
1 730 BUCKLOW & MONTAGUE. Electric projector lamps for advertising, &c.
1 739 A. WILSON. Electric heaters for incubators, &c.
1 756 J. W. HALL. Electro-magnetic clutches.
1 762 A. E. & K. S. MILLS. Electro-mechanical relays.
1 763 W. S. JEAL & M. PAYNE. Accumulators, &c.
1 769 METROPOLITAN-VICKERS ELECTRICAL Co., W. A. COATES, & D. R. Davies. Potential transformers and fuses used therewith.
1 770 METROPOLITAN-VICKERS ELECTRICAL Co. Protective relay apparatus. (20/1/21, U.S.)
1 774 SACHSENWERK LICHT UND KRAFT A. G. Three-pole oil switches. (21/4/21, Germany.)
1 784 SIEMENS-SCHUCKERTWERKE. Mounting commutators of electric machines. (20/1/21, Germany.)
1 785 J. F. MONNOT. Electric switching devices.
1 790 B. T.-H. Co. Systems for producing oscillating currents. (18/15/21, U.S.)
1 791 B. T.-H. Co. (G. E. Co.). Leading in wires.
1 792 B. T.-H. Co. Electron devices. (29/8/21, U.S.)
1 793 B. T.-H. Co. Electron discharge devices. (1/7/21, U.S.)

January 21, 1922.

1 834 J. F. SUTTON. Machines for making coils of insulated wire, &c.
1 838 J. F. SUTTON. Inductance coils for wireless telegraphy, &c.
1 840 A. E. J. BALL & I. H. PARSONS. Electro-magnetic hammers for bells, &c.
1 847 H. W. RUSH. Incandescent lampholder.
1 848 E. POLLOCK. Radio telegraphy, &c.
1 862 SIEMENS & HALSKE AKT. GES. Telephone systems. (21/1/21, Germany.)
1 864 H. LEITNES. Accumulators.
1 865 J. H. COMPTON.—Electro-pneumatic relays and sustaining devices therefor.
1 875 GENERAL ELECTRIC Co., A. E. ANGOLD, & F. L. CASTLE. Electromotive apparatus for track circuit relays or electricity meters.
1 878 E. G. HARCOURT. Electric switches.
1 880 CHAMBERLAIN & HOOKHAM & S. JAMES. Power factor measuring or indicating instruments for alternating currents.
1 891 O. S. CORBETT. Electric control switch.

January 23, 1922.

1 910 J. L. GURNEY. Ampere-hour meter.
1 925 H. WOLFE, G. GRIFFITHS, & W. SLACK. Insulators for aerial lines.
1 936 R. TULL. Aerials for wireless signalling on steamships.
1 938 H. LEITNER. Systems of electric supply.
1 979 G. C. & G. C. N. BEALL. Regulating telephone calls.
1 981 WESTINGHOUSE BRAKE & SAXBY SIGNAL Co. Electric lamps for signalling, &c. (24/8/21, U.S.)
1 988 NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFIBR. Gasfilled glow discharge devices for amplifying current variations. (9/2/21, Holland.)
2 003 J. V. FOLL. Submarine telegraph, &c., signalling apparatus.
2 008 AUTOMATIC TELEPHONE MFG. Co. Train control systems.

January 24, 1922.

2 020 T. P. HOWARD. Telephone mouthpiece dust-proof cover.
2 033 W. L. SPENCE. Electro-magnetic friction brakes.
2 035 W. WILSON, C. C. GARRARD, & A. H. RAILING. Electric motor controlling apparatus.
2 068 REFARDT & NAGLE ELEKTRIZITÄTS GES. Automatic guard for three-phase asynchronous motors, &c.
2 069 REFARDT & NAGLE ELEKTRIZITÄTS GES & A. NAGLE. Direct acting magneto-electric driving mechanism for pumps.
2 081 J. WILSON. Filter for electric lamps or shades.
2 088 F. KRUPP AKT. GES. Overload circuit breakers. (19/2/21, Germany.)
2 089 F. KRUPP AKT. GES. Control of motors of electric vehicles. (4/2/21, Germany.)
2 097 BABCOCK & WILCOX & A. R. W. RICHARDSON. Electrical indication of impurities in feed water.

2 107 W. Gee. Switchboards and busbars therefor.
2 122 Cambridge & Paul Instrument Co. & W. H. Apthorpe. Pivoted moving-coil electrical measuring instruments.
2 123 Cie. Electro-Mecanique. Automatic starting of motors.
2 125 A. G. T. Cusins & Whittaker-Swinton. Vacuum or thermionic tubes or lamp bulbs.
2 145 Automatic Telephone Mfg. Co. Telephone systems. (9/2/21, U.S.)
2 149 G. Shearing, G. A. Irving, & L. G. Preston. Thermionic valves, &c.
2 150 B. Hodgson & L. G. Preston. Thermionic vacuum tubes.
2 151 B. Hodgson & L. G. Preston. Thermionic valves, &c.
2 152 B. Hodgson, H. G. Hughes, & L. G. Preston. Thermionic valves, &c.
2 153 G. Shearing & L. G. Preston. Thermionic valve transmitting sets for wireless telegraphy, &c.

January 25, 1922.

2 157 P. J. Gates. Switchboards.
2 180 Radio Communication Co. & J. Scott-Taggart. Wireless receiving apparatus, &c.
2 213 D. von Mihaly. Selenium, &c., cells. (9/12/20, Austria.)
2 214 D. von Mihaly. Oscillagraphs. (9/12/20, Austria.)
2 235 Efandem Co. & J. Eton. Electrically-driven sirens.
2 242 Z. Trotzer. Electric water heaters. (24/11/20, Hungary.)
2 258 Crypto Electrical Co. & H. G. Sharp. Induction motors for a.c.
2 260 & 2 262 Metropolitan-Vickers Electrical Co. & L. H. A. Carr. Electric ship propulsion systems.
2 261 Metropolitan-Vickers Electrical Co. & L. H. A. Carr. Alternate current motors.
2 266 A. H. Railing & A. E. Angold. Magneto-electric lamps.
2 267 A. Wirth.—Electric lighters. (26/1/21, France.)
2 277 Bayerische Elektrizitäts-Industrie Rott & Co. Automatic electric fuse switches. (25/1/21, Germany.)
2 280 E. A. Graham. Diaphragms for telephone receivers, &c.
2 281 H. J. Monson. Electric treatment of liquids.
2 287 Aktiebolaget Ferrolegeringar. Product of metals and alloys poor in carbon and silicon in electric furnaces. (29/1/21, Sweden.)
2 294 B. T.-H. Co. Recording and reproducing sounds. (20/5/21, U.S.)
2 295 B. T.-H. Co. & A P. Young. Magneto-electric machine.

January 26, 1922.

2 351 E. W. Pattison (Dictagraph Products Corporation). Extensible cable devices.
2 352 E. W. Pattison (Dictagraph Products Corporation). Telephone transmitters.
2 355 G. H & H. F. Collins. Electric connectors.
2 370 A. Edgar. Appliances for registering telephone calls.
2 375 Vulcan Motor & Engineering Co. (1906) & C. B. Wardman. Electric cable attachments.
2 379 Quasi Arc Co. & A. P. Strohmenger. Arc welding systems operated with a.c.
2 394 Metropolitan-Vickers Electrical Co. & D. R. Davies. Switch gear.
2 395 & 2 396 Metropolitan-Vickers Electrical Company. Electric relays. (26/2/21, U.S.)
2 399 B. T.-H. Co. & A. P. Young. Magneto-electric machines.
2 400 B. T.-H. Co. (G. E. Co.). Lightning arresters, &c.
2 401 B. T.-H. Co. (G. E. Co.). Incandescent lamps.
2 412 F. R. Bull. Electrical sorting machines for sorting perforated statistical, &c., cards. (28/11/21, Norway.)
2 416 W. Gee. Electric wall-plug.
2 430 F. Chiantore. Machines for coating current-conducting wires and cables with asbestos, &c.
2 438 L. G. Preston, H. G. Hughes, & S. R. Mullard. Thermionic valves, &c.

January 27, 1922.

2 458 G. F. Evans. Electric egg tester.
2 511 Akt. Ges. E. Haefely et Cie. High tension transformers. (9/2/21, Switzerland.)
2 513 Western Union Telegraph Co. & J. V. Foll. Synchronous telegraph systems.
2 516 B. T.-H. Co. (G. E. Co.). Current producing seals for electric apparatus.
2 517 Western Electric Co. & G. Deakin. Telephone systems.
2 521 Western Union Telegraph Co., A. H. Railing, & J. V. Foll. Telegraph transmitters.
2 523 C. C. Garrard. Electric propulsion of ships.
2 525 I. Panza. Electric foot warmer for vehicles. (31/1/21, Italy.)
2 536 Ges. für Drahtlose Telegraphie. Radio receiving systems. (3/1/21, Germany.)
2 560 General Electric Co., Ltd. Incandescent lamps. (4/2/21, Germany.)

January 28, 1922.

2 581 H. Green. Signalling and telephoning without special conductors.
2 589 T. S. Rogers. Electric horns.
2 620 F. D. Maclean. Tuned wave transmission.
2 632 L. G. W. Guest & H. O. Merriman. Eelctric signs.
2 641 A. MacCallum. Electric lamps.

January 30, 1922.

2 676 U. Beaton & Kersting. Windings of electrical coils.
2 686 W. J. Minton. Relay or magnetic circuit for relays, &c.
2 689 P. J. Gumbley. Apparatus for ascertaining and indicating capacity of accumulators.
2 698 E. A. Hailwood. Electric lamp bulbs.
2 699 L. Busserrau & R. Thorne. Junction box, &c., for l.t. circuits of motor-cars, telephone bells, &c.
2 706 F. Krupp Akt. Ges. Electro-magnetic overload circuit breakers. (24/2/21, Germany.)
2 712 V. Boscato. Ignition starting devices for magnetos.
2 717 R. Cavedoni & E. Marinelli. Incandescent lamps.
2 728 A. C. Hyde. Electrodes for arc welding.
2 735 Electric Fires, Ltd., C. H. Smith, & F. L. Newhouse. Electric fires, &c.
2 736 Siemens & Halske A. G. Telephone systems. (31/1/21, Germany.)
2 738 H. Baron (Aldendorff). Automatic electric switching systems.
2 748 Whitecross Co., H. D. Lloyd & W. W. Wilson. Electrodes for welding, &c.
2 757 G. & J. Oldham. Galvanic batteries.
2 762 Johnson & Phillips & H. M. Lacey. Voltage regulator for a.c. circuits.
2 764 J. B. Regan. Induction train control systems.
2 769 A. D. Mackenzie. Dynamos
2 778 Soc. Industrielle des Procédés W. A. Loth. Electrically steering movable objects at a distance.
2 782 Allgemeine Elektricitäts Ges. Connecting insulator for high voltages. (31/1/21, Germany.)
2 785 L. Satchwell. Electric controllers.
2 797 & 2 798 H. E. Sunderland. Electric switches, switch fuses, &c.

January 31, 1922.

2 791 E. S. Gray. Electric resistances.
2 824 R. H. Derry. Electrically operated stop motions for textile machines, &c.

CONTENTS.

Notes of the Week.

The Electricity Bill Opposition.

It is often a little difficult to gauge the exact amount of opposition to a Parliamentary measure when it deals with industrial questions; and the Electricity Bill is no exception to that rule. For opposition, whether great or small, is always "full of sound and fury," but how much this "sound and fury" signifies is another matter. An analysis of the opposition to the Electricity Bill (and we mean opposition that would like to throw out the Bill altogether) may not therefore be out of place. In the first place, the London County Council not only support, but definitely urge the adoption of the Bill. So do the Municipal Electricity Supply Authorities of Greater London and the I.M.E.A. Indeed, all the municipal undertakings are either active or tacit supporters. And as regards the electricity supply companies, a large majority of them, too, are offering no opposition. The West End of London group of companies do not seem to have given any strong public indication of disapproval, and, as in June last they were parties to a proposal to form a Joint Electricity Authority for London, it would surely be anomalous to find them now active in the ranks of the other side, to say nothing of their interest in extended tenure, which only fresh legislation can provide.

Analysis of the Remainder.

This leaves us with only the power companies, and of these the number who are actually in opposition are probably few. For instance, we can assume that the North Metropolitan Company are not among them, as the Commissioners have assigned them a very important part in the scheme for London. The Cornwall Power Company we also assume are not militant, being out of schemes altogether. The Lancashire Power Company, seeing that they co-operate with the Manchester Corporation, are likely to feel nothing but a languid interest in the proceedings. The Newcastle-on-Tyne Supply Company is not interested in any schemes; and if there should at any time be a scheme for the North-East Coast, Bill or no Bill, it is obvious that they would dominate the district. As regards the North Wales Power Company, seeing that they hold the field in the scheme for North Wales and Chester, they may certainly be assumed out of the fight. The Shropshire and Worcestershire Power Company are parties with the Birmingham Corporation for a scheme for that district, so again here militant action would hardly seem to be indicated. This leaves the Yorkshire Power Company, the South Wales Power Company, the Derbyshire and Nottingham Company, the Leicestershire and Warwickshire Power Company, and the four Scottish Companies, some at least of whom seem to be in strong opposition to the Bill. But this is quite a small section of the industry, even giving the opposition one or two we have not enumerated. We can certainly say with propriety that the Bill is not opposed by the industry as a whole, and, if we are right in our analysis, not by even an important section of it. Parliament should therefore pass it without delay.

Institution Affairs.

Proceedings at the special general meetings of the Institution of Electrical Engineers last week were a little dull. The formal transfer of the liabilities of the old Institution to the chartered body was effected as quickly as a high-speed circuit breaker does its work, and the new by-laws were passed after a short discussion, in which only two points of any importance were raised. The first of these criticisms, if that is not too strong a word, was made by Dr. S. P. Smith on the delicate question of the procedure to be followed in cases of expulsion. The effect of the new by-law is to make the deciding body the Council, instead of the general body of members, with a possible appeal to a special court of three past-presidents. It is easy to find weak points in this; and Dr. Smith found most of them.

But it is not so easy to suggest a means of dealing with the difficulty which shall be at once democratic, fair, and avoid that publicity which is not only undesirable but dangerous. But it may be pointed out in such cases the Council is the court, not the prosecutor (that office is performed by the small body of complainants), and that it is better and fairer, both in practice and theory, that a court should be small. It would not be small if it were formed of the general body of members. If substantial injustice is done (and we have reason to hope it never will be done) the members have their remedy in the Council elections.

Council Election Procedure.

The point made by Mr. F. C. Raphael had more substance. Criticising the procedure suggested for the election of the Council, he pointed out that it was a reversion to methods which had been successfully combated years before. While we see the force of Mr. Atkinson's remark, that it is undesirable to ask members to stand on the Council's nomination when that body cannot give all of them its full support, yet this is surely a lesser evil than to revert to a system where nomination to the Council is automatically followed by election. We are glad to have Mr. Atkinson's assurance that the Council have no such retrograde object in view; that, in fact, they welcome outside nominations. It therefore rests with the general body of members to make nominations freely and to ensure that each year there is a well-contested election. This would not only be true democracy, but would overcome Mr. Raphael's objections. The only alternative is some form of negative vote, such as that suggested by Mr. Austin Hopkinson for Parliamentary elections. But that would be a big experiment.

The South-West Midlands Decision.

Approval has been given by the Electricity Commissioners to the scheme of electricity supply reorganisation for the South-West Midlands Electricity District which was put forward by Birmingham Corporation and the Shropshire, Worcestershire, and Staffordshire Electric Power Company at the public inquiry in November last. Instead of a Joint Electricity Authority there will be a Joint Advisory Committee of four, two from each of the promoters, and practically the whole of the district has been divided into two spheres of influence, one of which will be governed by the Corporation and the other by the company. Worcester Corporation, being in a remote part of the district, will develop its own electricity undertaking, and so will Malvern and Sutton Coldfield—at least for some years.

No Joint Authority.

As this is the first case in which a Joint Authority has been dispensed with we shall watch the outcome with interest. A small homogeneous committee of four will start out with undoubted advantages over a larger body, for there will be no conflicting interests to reconcile, and decisions can be promptly made and executed. But, though the parties are working harmoniously at present, there is a danger that later on there may be a two-and-two division of opinion on the committee. There will, however, be an appeal to the Commissioners in this event, and it is probable that the latter may be able to obviate the development of any acute differences. Certain adjustments of the boundaries of the district have been made in accordance with the wishes of the parties interested. Stourbridge, Rowley Regis, Lye and Wollescote have been excluded, and Tamworth and parts of Dudley, Seisdon, and Tewkesbury rural districts have been included. A draft Order, embodying the scheme, is in course of preparation, and it is hoped to hold the further inquiry in May. This would seem to indicate that little local opposition is apprehended, and it is probable that the South-West Midlands may be the first district in which an approved scheme is put into operation. It is a good example of what co-operation can do, and it is also an answer to those who assert that the Commissioners are bent upon the stereotyping of administrative methods by setting up Joint Electricity Authorities throughout the country.

University Education.

The report of the Royal Commission on Oxford and Cambridge Universities, which was issued at the end of last week, will leave electrical engineers a little cold. It is true a fortunate few of them have studied in the ancient shadows of the latter University, and still fewer in the rather unsympathetic atmosphere of the other "home of lost causes," but the large majority, when they have received any University education at all, have belonged to one of those newer bodies, where youth and enterprise to some extent compensate for age and tradition. Some, too, have given their attention to the great technical Universities abroad. Apart from this, however, the report is really a domestic affair. The members of the Commission were all either Oxford or Cambridge men, and might therefore have been expected to view, as they do, the idiosyncrasies of old age with a loving eye. The criticisms are, indeed, very mild, probably because the Royal Commissioners find that both Universities are adapting themselves with readiness and vigour to the demands of a new age. We are glad to hear that this is the case. As Mr. Highfield said last week, science without commerce is as nothing. And it is none the less true that a closer union between pure and applied science is essential for the well-being of both.

The Financial Difficulty.

The chief difficulties that face all Universities—not Oxford and Cambridge alone—at the present time is, of course, finance. The report is in the main a plea that it should be made possible for the institutions financially to do as they are doing, and for that reason it is suggested that the present grant of £30 000 should be increased to £100 000, in addition to £10 000 a year for special purposes. A large part of this increase would go in improving salaries and pensions, and to this no exception can be taken. But we hope that this grant will be accompanied by conditions which will open the doors of the Universities to all deserving students. At present the doors are not so open. Sometimes voluntarily, and sometimes involuntarily, there is discrimination. This is not only undesirable from the educational point of view, but it prevents that intellectual intermingling of all classes of young men and young women for the good of themselves and their country in the way the term University properly connotes. Oxford and Cambridge have advantages of tradition and environment possessed by few other educational institutions. These advantages should be placed at the disposal of all.

The First Wireless Telegraph Prosecution.

The Merchant Shipping (Wireless Telegraphy) Act of 1919 and the Board of Trade Regulations made thereunder are presumably designed for safeguarding life at sea, but if the position of affairs disclosed at the first prosecution under the Act, which we record elsewhere, is present on other ships, it is time the Rules were made more stringent. The actual offence, to which a plea of guilty was entered, was not having a wireless operator or certificated watcher

on board the s.s. " Clan Malcolm " on the night of October 8th last. It was stated that the wireless room was so situated that it would take four or five minutes to receive a message and call the operator, and that it would take seven or eight minutes to communicate with the bridge of the ship. The evidence seemed to show that even if there had been an operator on board at the time, the unfortunate collision, which occurred off Wigtownshire, and resulted in the loss of over 30 lives, would probably have taken place, but it is clearly possible to make better arrangements for wireless telegraph signalling, and it should be the duty of the Board to see that they are made and complied with. Under the circumstances, though the master of the ship may not be responsible for the staffing arrangements, we think that the fine of £25 inflicted is a light penalty.

The "British Insulated"—Record Year.

It is a pleasure to be able to record, despite the depressed condition of most branches of trade and the serious industrial strife, the continued success of that old-established and prudently managed company, the British Insulated & Helsby Cables, Ltd. The profit made in the past year reached the record figure of £502 524, or an increase of £161 811 over that for 1920, and this highly satisfactory result must be attributed to the foresight and sound policy of the directors and managers. At the last annual meeting the chairman, Mr. James Taylor, announced that the company had to face a large capital expenditure for the purpose of reorganising their works after the war. This reorganisation has been carried out to good purpose, and the increased expenditure has been fully justified. For with the developments in electricity supply has come a demand for high-tension cables, and it is claimed that there is no firm in the country in a better position to meet the requirements of the industry in this respect.

Prudence and Progress.

At the annual meeting on Monday Mr. Taylor's task was, therefore, easy and pleasant, and he was able to state that the company had completed the orders on their books a year ago, and to execute promptly other orders subsequently received. Two years ago the directors were empowered to raise fresh capital, but they have been able to pass through the exceptionally trying intervening period without exercising those powers. They were one of the few companies which has not required to increase capital at a time when the rate of interest was high. It will thus be seen that the happy position of the company is due to prudent financial methods in the past and to a judicious expenditure on tools and equipment in order to keep well abreast of the times. After paying debenture interest and the preference dividend, and making provision for reserves and depreciation, the ordinary shareholders get a return of 15 per cent. for the year, leaving £362 223 to carry forward. Though there are indications of a falling off in trade the position of the company is a strong one, and they are able to face the situation with confidence.

Low Pressure at Nottingham.

That keen and persistent critic of the Nottingham Corporation Electricity Department, Mr. H. W. Cox, seems at last to have discovered a genuine grievance; and, as usual, he has written to the papers about it. Having satisfied himself of the theoretical advantages of electric heating, he had a radiator installed in his office, but the practical results were so unsatisfactory that he instructed the dealer who supplied it to take it away. Instead of doing so the latter tested the pressure of the Corporation supply and found it to be only 186 V instead of 200 V, the declared pressure, which explains both the milk in the cocoanut and the lack of heat in the radiator.

The Consumer's Remedy.

But while Nottingham is unique in possessing Mr. Cox, we are afraid it is not alone in supplying at a too low pressure, and we may therefore indicate to Mr. Cox and to other consumers in similar circumstances the remedy that is open to them. By No. 3 of the Regulations of the Electricity Commissioners the supply authority must declare the constant pressure at which it proposes to supply energy at the consumer's terminals, and that pressure must be maintained, subject to a variation of four per cent. Failure to comply with this regulation involves a penalty of £5 for each default, with a daily penalty of £5. Mr. Cox might therefore have recourse to the Police Court if his supply continues to be unsatisfactory. At Nottingham the pressure limits would be 192 and 208 V, and there would, therefore, appear to be a clear cause of complaint. Such action as we suggest would tend to discourage supply at low pressures, and this would be a good thing, as it militates against electrical progress, more especially in the domestic supply field. If there is a shortage of generating plant or the supply mains are overloaded, no more customers should be connected until a proper supply can be given.

The Contractor and the Showroom.

The electrical contractor has for long been exposed to much criticism from other branches of the industry. Some of this is, we fear, justified, and some of it arises from his position in the vanguard of the advance into the domestic field. We forget the exact duties of the leader of a vanguard, but without reference to military textbooks we do recall that they are pretty strenuous; and that upon their proper performance depends much of the success or failure of the campaign. We are therefore glad to see that one firm, Troughton & Young, have realised this, and that by inaugurating an exhibition of a showroom character on their premises have taken a step which we hope will be more widely followed. The duty of a contractor is not to make things, but to secure installation orders and to sell electrical goods. If, therefore, he has on view in his showroom the products of various manufacturers, and advises his clients judicially on what to buy to satisfy their peculiar needs, he is not only likely to reap the reward of his own enterprise, but will do a great deal to benefit the electrical industry generally.

Reduction of Charges Spreading.

We are glad to see that the movement to reduce charges is spreading among electricity supply undertakings. We hope it will continue to spread, both in area and in depth, for this is the most certain way of ensuring that expansion of trade we so sorely need. An interesting example of this tendency is to be found at Hackney, where energy consumed for domestic purposes, other than lighting, is to be charged at 1d. in the June and September and at 2d. in the December and March quarters, instead of at 1½d. and 2½d., as at present. In addition, the two-rate domestic tariff is to be altered from £3 4s. per kW per quarter plus 1½d. per kWh to 2s. per quarter per 60 W lamp plus 1d. This is not only a substantial reduction, but is a more equitable method of charging for small installations. Power and lighting scales and the amounts charged for electric vehicle charging are also to be altered in a lowerward direction, so that we may perhaps expect a migration towards Hackney, and even a demand that the marshes should be built over in order that full advantage may be taken of cheap electricity.

Trade Promotion.

An electrical engineer, who is in charge of an undertaking which supplies what is generally considered to be a well-developed area, recently told us that as a result of a canvass it had been found that only 10 per cent. of his consumers used electricity for any other purpose than lighting. In this area practically every house and flat is connected to the mains, and an energetic and continuous campaign is maintained to secure cooking and heating connections so as to increase the output and improve the load factor. If this is the condition of affairs in such an area, which—we emphasise the point—is already exceptionally well developed because those supplying it see in the increase in the domestic load the one chance of salvation, what must it be in areas where numerous inhabitants do not use electricity for any purpose, and where those who do use it for lighting are not encouraged, and are sometimes even discouraged, from employing it for other purposes.

Why the Domestic Load Must be Increased.

These facts are put forward in no carping spirit. But, as we have pointed out on other occasions, the power load, which in many areas has long been the revenue producer, can almost be allowed to develop itself. Arguments in favour of the electric drive are hardly required; its advantages are self-evident. The same may be said of lighting, though an increase in the lighting load unaccompanied by other uses brings difficulties to the undertaking which almost makes its room preferable to its acquisition. The moral, then, is (if we may intrude it so early in the story) that the domestic field is the one which the electrical industry must till and continue to till at every season so as to obtain its bread and cheese, not to speak of those other amenities which make existence worth the endurance.

A Not Surprising Neglect.

The neglect of that field in the past—even in the present—is not surprising. There have been grave difficulties in the way, which are known to us all; there have been obstacles to overcome of policy, technique, and commerce, but the road is now comparatively clear; we are ready to advance, and it is not, therefore, out of place to examine what is before us and to see what preparations can be made to render the journey as comfortable and profitable as we can.

Possible Domestic Load—Infinitely Large.

The first thing that strikes anyone who looks into the matter is that the possible domestic load is as nearly related to infinity as anything can be. Some figures from the United States make this clear. In that country, while 7 000 000 homes are wired for electricity, 14 000 000 still remain to be wired. These figures do not take new houses into account. Of the houses that are wired electrically 36 per cent. have electric washers, 71 per cent. electric irons, 40 per cent. electric vacuum cleaners, 2 per cent. electric dish washers, and only 2 per cent. electric cookers. We have not been able to obtain similar figures, which we could put forward as accurate, for this country, but we have reason to believe that not only would the gross figures be smaller (that is only natural), but that the percentages of electrical apparatus other than lighting used in wired houses would be much smaller too, as the ratio of electrically wired houses to those not so treated would also be less.

A Reason for Booming the Cooker.

It will be noticed that electric cookers are among the least used of electrical apparatus, and that electric irons are employed most. Yet in an average household cooking is carried on for about 25 hours a week, and ironing for only about five hours. As a consumer of electrical energy, too (which is, after all, the object which the supply engineer and the electrical industry has in view) the cooker is infinitely superior to the iron. One explanation of this may be that the sale of irons has been pressed more vigorously than that of cookers, and that in so doing the electrical industry has been fighting against its best interests.

Price and Timidity.

We think, however, that there are other explanations—price and timidity among them. The cooker has been up to the present inevitably an expensive apparatus. Apart from increases in the cost of labour and materials the research work which has necessarily had to be carried on to convert experimental equipment into a finished article could not be performed without a reflection in the selling price. We hope that the downward tendency which has recently become visible will continue; it is necessary for development. Timidity on the part of the electrical industry has, however, been a contributing factor to this state of affairs. To develop the domestic load, it is agreed, is all very well, but it is better to begin with small things like irons rather than with such a mighty experiment as a cooker. When a short step is taken it is so much easier to retract. We hope that is another thing which is going to be changed.

Public Eagerness for Electricity.

One grave obstacle, however, the electrical industry has not had to face—public prejudice. As a result partly of education by somewhat slow-moving and lethargic propaganda (this is no reflection on E.D.A.) and partly by instinct the public is already interested in domestic electric equipment, and would be much more interested were that equipment cheaper or money more plentiful. It is argued that cheapness is a fetish, and that the public will always pay a good price for a good article. We agree. But at present there is a great gulf fixed between the price asked and the price that can be given. As we have said, we hope that will be changed not only by electrical manufacturers, but by electricity supply authorities. We are glad to see that the tendency is all in that direction.

The Need for Using Hiring Powers.

Development on the lines we all desire will, however, be much assisted by the utilisation by electricity supply authorities of the hiring powers they now possess and by the granting of further powers for the hire purchase of apparatus in conjunction with local contractors. This co-operation, coupled with a reduction in the price of energy for domestic purposes and by well-thought-out propaganda campaigns, cannot fail to assist progress. That this is so is confirmed by the details of the hiring scheme recently undertaken at Glasgow, which Mr. Hardie gives on another page of this issue. The policy is enlightened, and the tariff is low, and it is not to be wondered at that success has been obtained. We hope it is an example which will be widely followed. Mr. Pinkney's careful analysis of the same subject shows what can be done in this direction with success.

The Future of the Domestic Load.

Matters cannot, however, rest as they are. The figures we have given above refer only to existing houses. They do not take into account the new houses which are being built and will be built in years to come. In these houses it should be possible to apply past experience in the most efficient way and make the use of electricity more convenient than it is even at present. One way of doing this is by the means of special "electrical furniture," such as that described by

Mr. Earl Whitehorne, on another page of this issue. This overcomes what is undoubtedly a disadvantage of present methods—trailing wires and the necessity of frequent disconnections. In this arrangement the plugs and sockets are placed on the furniture itself, and though connection is made, as heretofore, from wall plugs, as furniture is only infrequently moved this is no grave disadvantage. On the other hand electrifying the furniture allows electrical apparatus to be employed in a number of ingenious and unusual ways.

There is, therefore, every reason for optimism in the situation, though that is not to say there are no difficulties. They are, in fact, numerous enough. They include questions of price, tariff, design, and manufacture, and, above all, they include the need for electrical engineers to believe, and act as if they believed, in their own specific.

The Telephone Report.

Of all the branches of public administration probably none has been subjected to such severe and general criticism as the telephone service. Inefficiency, due to shortage of plant and other causes, and excessive charges, caused by the political situation, recently engendered such a strong agitation that a Select Committee was appointed to investigate the methods of organisation and of fixing charges employed. This Committee, of which Sir Evelyn Cecil acted as chairman, held 33 sittings and examined many witnesses, including telephone engineers, representatives of commercial and business organisations, telephone users, and others. In addition, the chairman and the Committee's assessor, Mr. W. W. Cook, visited Scandinavia and Switzerland, while Mr. Cook journeyed to America in search of information. The result of this investigation is a business-like and instructive report containing a number of recommendations which, if adopted, should lead to a cheaper and improved service and should also assist in removing that prejudice against the telephone which is a serious obstacle to progress at present.

Separation of P.O. Departments.

The Committee's recommendations are printed in another column, and they may be grouped under two main heads, viz., organisation and methods of charging, though the two are inter-related.

It is suggested that the "reorganisation of the telephone administration on more commercial lines is the fundamental requirement for efficient development, and that it will prove a solution of most of the failings which have been disclosed." It is, therefore, proposed that the mails branch of the Post Office should be separated from the telegraph and telephone departments, and that an administrative Board should be formed of the heads of departments under the Postmaster-General. There is much to be said in favour of this division, which appears to be working satisfactorily in Sweden and Norway, though, as the same buildings are used for the three services, there may be some difficulty in making a fair allocation of the cost of maintenance and upkeep.

Need for Commercial Accountancy and Business Methods.

The Committee also think that the accounts should be kept in a more commercial form, that the transactions generally display a parsimony of business method, and that there is a tendency to a cast-iron application of regulations in an improper way. It is these rigid, cast-iron methods which have engendered the strong public feeling against the Post Office, and we feel sure that a little sympathetic feeling on the part of telephone officials would arouse a ready response in those who have to use the telephone. It should be recollected that the telephone is now an absolute necessity for business, and that human beings are not "mere automata for making telephone accounts balance." On the other hand, the public are asked for a fuller appreciation of technical difficulties and a less chronic suspicion of the Post Office. Both are necessary if the telephone is to improve and be used as it should be.

Reduction of Charges Proposed.

One of the most welcome recommendations is an immediate reduction of ten per cent. in telephone charges. This would be made possible by the abolition of the annual charge for extra depreciation, the revision of the charge for ordinary depreciation, and by debiting salaries and overhead charges for new construction work and renewals to capital and depreciation respectively and not to revenue, as has hitherto been the practice. We understand that the Post Office authorities have already made the last-mentioned change, but the others are to be referred to accountants for report. Proper provision should undoubtedly be made for depreciation, but we are inclined to agree that the present scale is unnecessarily high. Apart from these matters, there is room for a reduction in charges as wages and the cost of materials have come down, and as further falls in these are likely there should be a gradual lowering of the telephone rates.

The Message Rate Approved.

We are not surprised to see that the Committee pronounce in favour of the message-rate system of charging, though it is stated that the flat rate has much in its favour, especially in smaller centres, but these must be exceptional. It is also proposed that the extra mileage charge should be reduced from £10 to £5 a mile, and the reduced charge on trunk calls after seven p.m. should apply after two p.m. on Saturdays and all day on Sundays. On the question of automatic telephony the Committee are cautious, as they do not recommend an unduly hasty adoption of the system until the commercial results of the automatic apparatus installed by the Post Office have been ascertained, though they have no doubt it would give a faster service on a majority of calls.

Technical Staff Not to Blame for Defects.

Whatever the defects of the telephone service may be we have never attributed them to the shortcomings of the technical staff, and, therefore, we are glad to see that the Committee have been impressed with the capacity, assiduity and single-mindedness of the officials of the Post Office who gave evidence. They are described as men devoted to the public service, keenly watchful for its welfare, well skilled in their calling and with an intimate knowledge of their duties.

We have no doubt that the suggestions and recommendations made in the report will have a stimulative effect, and, whether it be possible to adopt the whole of them at once or not, some changes must be made, and we hope that these will inaugurate a reform movement which will provide a telephone service adequate to the country's needs. At present the telephone is not so extensively used here as in America and in certain European countries, and it should be one of the tasks of the Post Office, or, perhaps, of the new telephone Board, to make up for this defect by giving a much cheaper and better service. In this way, and in this way alone, can there be that expansion of the telephone which will enable this country to compare favourably with other commercial nations.

The Hiring of Domestic Electric Apparatus.

By W. F. T. PINKNEY.

Until some ten years ago electricity supply authorities which hired out motors made rapid strides in obtaining consumers for motive power purposes, but with the firmly established recognition that electricity is the premier form of power the necessity of hiring out motors has ceased to exist. Hiring served its purpose in establishing confidence in the prospective consumer, who was more ready to give the electric drive a fair trial when his initial expenditure was reduced to a minimum, and when he knew that if unsatisfactory he could revert to other power, and that his experiment would cost him little.

The Present Domestic Position.

In the domestic field we are in the same position in regard to uses of electricity other than lighting that we were in years ago with regard to motive power. Until the domestic user has had an opportunity of trying it, he does not recognise the enormous advantages of electricity for all purposes, and is not prepared to purchase apparatus for what he looks upon as an experiment, without any real confidence that all a salesman tells him is true.

Apart from the fact that hiring domestic apparatus is the easiest method by which to obtain profitable consumers, the hire figures themselves may be arranged to yield a reasonable profit. There is a great advantage in the hiring of domestic apparatus over the hiring of motors, in that to supply motive power the Supply Authority had, as a rule, to expend a considerable sum in laying in service cables, and therefore did take some risk of loss if the use were discontinued. With domestic apparatus it almost invariably applies to premises where electricity is already installed, and yields extra revenue without further initial expenditure, so that if for any reason the use is discontinued no loss is incurred.

Class of Apparatus to Hire.

The pieces of apparatus most valuable for hire purposes are irons, kettles, fires, and cookers. Water heaters and wash boilers may also be considered. Such apparatus as vacuum cleaners, washing machines, dish washers, polishing machines, etc., should not be hired out, as, apart from the rentals, they yield practically no revenue, and if maintenance is included in the hiring system they necessitate holding a small but very varied stock of replacements.

It may be mentioned here that cookers must be considered as a class apart from other apparatus. It is not possible to obtain the same relatively high rental from cookers as from other apparatus. Owing to the high diversity factor the load is a profitable one, and it is desirable to keep the rentals as low as possible in order to encourage the use of cookers.

Hire Service and Maintenance.

Hiring should include maintenance and prompt service, for then the consumer feels that the Supply Authority shows its confidence in its apparatus if maintenance is included in a reasonable rental. With most modern apparatus maintenance is so low in cost that there should be no hesitation in undertaking it. It is very desirable to keep down the stock of replacement parts and to limit its range, and with this in view the writer advises that hired apparatus should be limited to as few makes of each class of apparatus as possible.

Irons and Kettles.

One type of iron is quite sufficient, and kettles should be limited to the most popular size—that is 2 pint, or at most 2 pint and 3 pint.

To avoid the necessity of immediate repair of irons or kettles, one or two complete spares may be kept ready and a few flexibles and connectors kept wired up; the consumers can be supplied immediately with a replacement when occasion demands, and the faulty iron repaired at any convenient time.

It is a good plan to keep apparatus for this purpose which is serviceable but a little shabby in appearance, as the consumer is more ready to take back his own when repaired, and it is thus easier to keep track of the particular apparatus hired to consumers.

Fires and Cookers.

In the case of fires it will be found advisable to hire a few different types of varying capacity, but they should be of the cheaper designs, and of as few different makes as reasonably possible. The design should admit of quick replacement of parts.

It will be seen from the maintenance figures given below that cooker maintenance is relatively costly at present, but it is likely to be considerably reduced from now onwards, and from figures available to the writer, it appears that the radiant hot plate will prove cheaper to maintain than the non-radiant type.

Maintenance Hints.

Maintenance of cookers, in particular, must be prompt if they are to receive the rapid adoption amongst consumers which they merit. The design of the oven should be such as to enable elements to be replaced quickly, and when replacing hot plates the writer strongly advises the replacement of the faulty plate by a new one, and not to replace elements in hot plates "on the job." The average housewife dislikes a workman hanging round for any longer time than is necessary. Also in the repair of non-radiant plates some experience and considerable care is necessary in the clamping up of the elements if further burn-outs after a short period are to be avoided. It is inadvisable to replace a portion only of the elements of a burnt-out hot-plate and leave any old ones in. The used ones probably won't last long and will lead to another fault after a relatively short period.

The Newcastle Company has recently entered into an arrangement with one manufacturing firm whereby a stock of new spare plates is held in readiness, and in the case of failure new plates are installed and the old ones are returned to the makers, who allow a reasonable credit, and this arrangement is proving very satisfactory in reducing the amount of maintenance and keeping down the labour cost.

Wherever a cooker is hired out a self-contained kettle should accompany it. In the Newcastle district the kettle is separately hired, but the question of making a self-contained kettle part of the standard cooking equipment is receiving consideration, and is an arrangement which has proved satisfactory in other districts.

Form of Agreement.

The agreement or application which the consumer must sign should be as short and simple as possible, but should contain the following provisions:—

(1) That the Supply Authority shall only maintain against fair wear and tear, so that mechanical damage or breakdown due to carelessness is repaired by the Supply Authority at the cost of the consumer.

(2) Six months' notice should be required to terminate the hire.

If no such provision is made, the hiring of fires, in particular, will frequently be terminated in the summer months, and application for re-hire received in the winter. Kettles and irons would be hired for short periods, and the rentals received for such short periods might not pay the cost of any re-polishing which might be necessary before sending out again on hire. Also frequent returns of hired apparatus of this nature would increase the cost of recording and book-keeping, and would necessitate larger storing accommodation.

In some districts the hirer is required to undertake the hire for a minimum period of one year or two years, but

in the writer's opinion many prospective hirers may hesitate to be bound for so long a period.

An alternative to provision 2 above might be as follows: Six months' notice shall be given to terminate the hire, except that in the event of the hirer vacating the premises one month's notice will apply. If the hirer shall terminate the hire within twelve months from the date of hiring he shall pay the cost of any overhaul which may be necessary.

Basis of Rental.

As the object of a hiring system is to obtain as consumers those who are not prepared to purchase apparatus outright, the basis for a rental system must in some measure be governed by the value of service to the consumer. On the one hand, it is unnecessary to hire out, say, electric irons at the lowest possible rental, as this would discourage direct sales. On the other hand, the rental of cookers must be kept as low as possible in order to encourage so valuable a load, and on account of the fact that the present high cost of cookers prevents direct sales.

The writer suggests assessing a rental for kettles, irons, and heaters to give reasonable interest on the expenditure, depreciation at 10 per cent. per annum, and to cover maintenance costs. The result will give a very low figure, which can be increased to such a figure that it will not discourage direct sales, but at the same time will be satisfactory to the user.

With cookers a life of fifteen years can be reckoned on, but even then it will only be found possible to obtain a rental which is economic in itself in wealthy residential districts. The real benefit from the hire is to be obtained from the sale of current.

The table below shows the cost of apparatus and rentals received in the Newcastle district.

Hiring is a means of publicity and a most valuable one, and when cookers are better known and the demand increases in consequence, the initial cost will be reduced and a more favourable rent in relation to cost can be obtained.

Apparatus.	Nett Cost.	Retail Price.	Average Maintenance cost per annum.	Rental per annum.	Approx. units sold per item per annum.
	£ s. d	£ s. d.	£ s. d.	£ s. d.	
Iron	0 12 8	1 1 0	0 1 0	0 6 0	35
Kettle, 2 pint	0 16 0	1 10 0	0 2 8	0 8 0	50
do. 3 „	1 10 0	2 10 0	0 2 8	0 10 0	70
Fires	1 10 0	2 12 6	0 2 7	0 12 0	500/1000
Cookers ...	12 10 0	22 0 0	1 0 0	1 10 0	1600
do.	16 0 0	25 0 0	1 0 0	2 0 0	1750

It should be noted that with most irons and many kettles the current is paid for at lighting rates.

Rental on a basis of an increased price per unit is sometimes advocated, but the writer is convinced that any such basis would be even more foolish with heating apparatus than it has proved in the past in hiring lighting installations. Such a basis discourages use, whereas the whole object of hiring is to encourage use.

Hired Wiring.

Hiring the wiring for cookers and fires should be considered, but except in poor districts it would not appear to be necessary at present. The hirer recognises that the Supply Authority which is prepared to hire is confident of its apparatus, and he therefore feels there is little risk in spending a few pounds on wiring. If it is decided to hire wiring the rental should be such that the cost is paid off in a short period—say two years—otherwise loss will be incurred when changes of tenancy take place, due either to the new tenant not using or requiring the wiring altered to suit his different domestic arrangements.

Tariffs.

It is not the purpose of this article to deal with tariffs, but it may be mentioned that it is not necessary nowadays to sell at such very low rates for domestic heating and cooking as were charged in some districts some years ago. Looked at merely from the point of view of value to the user, heating at 1¼d. per unit and cooking at 2d. per unit is quite reasonable at the present time. In actual fact, one rate is usually charged for both purposes and is generally round about the first-named figure wherever this class of business is cultivated. A two-part tariff is very necessary where any serious effort is made to obtain this load.

Recording of Hired Apparatus and Maintenance.

A card index system of records should be kept, with a separate card for each piece of apparatus, stating all particulars, including the maker's number. The date of any faults should be recorded on the card, together with the details of repair and cost in labour and material. These cards can be analysed monthly and the total monthly cost obtained. This method enables the nature of the most frequent faults to be traced, and steps can then be taken to reduce them as far as possible.

Keep in Touch with the User.

It is very desirable to employ a tactful lady demonstrator who is a good cook. She may be employed solely on demonstrating irons, kettles and cookers, and it should be her duty to visit every cooker user at definite periods. The rest of her time can be employed in leaving kettles or irons on trial with non-users, and a few irons and kettles can be kept for this purpose. If she knows her job she will soon know the consumers well. Arrangements should always be made beforehand for any demonstrations of this nature, either by a polite letter or by personal interview.

Publicity.

Some publicity is, of course, necessary, especially in inaugurating a hire system. The method which gives the best return is by periodical mailing letters, followed up by calls, and a record kept of all such calls. Slides in picture-theatres are a very valuable form of advertising, and can very often be used with advantage in connection with occasional advertising in the local Press.

The "Xcel" Electric Iron.

With the introduction of a new type of plug connector on the "Xcel" electric iron, the manufacturers, the Automatic Telephone Manufacturing Company, announce a considerable reduction in the price of the iron.

When the "Xcel" iron was first put on the market in 1919 we gave a short illustrated description of it (The Electrician, July 14, 1919), but since then various minor improvements have been effected, and the following details of its manufacture are of interest:—

The sole plate is made of specially fine-grade cast iron, entirely free from flaws; the surface in contact with the element is machined on a special electric grinder to a dead level, giving accuracy to 2/1000 in. The ironing face is also ground level to prevent any concavity of the surface, and is afterwards glazed, polished, and nickel plated.

The element is pressed down by a cast-iron clamp, also ground dead level, and is further secured by two substantial nuts on 5/16 in. screwed studs. This ensures intimate thermal contact. The heating element is composed of picked mica plates gauged to a thickness to give perfect insulation when hot. After considerable research, all known types of micanite were discarded owing to the insulation being low when the iron was at full heat. This is dangerous, particularly on a.c. circuits. The resistance ribbon used is the best, and the contact tags are of pure nickel.

Considerable experiment was made to arrive at a self-aligning contact that would be unaffected by heat, and always take up proper contact position on the element tags. This has been satisfactorily obtained by the special shape and metal used. With this arrangement of contacts no electrical connections have to be made when it is necessary to change an element. Absolute certainty of contact is ensured, which is not always the case in irons where contact is made between the brass terminal ends and the tags on the element. The brass in time oxidises, and eventually gives bad contact. The stamped steel top is of substantial thickness, about twice as thick as in American practice. The attached stand and terminal guard are in one substantial piece, entirely enclosing the terminals.

The plug connector is of a novel type, and is designed to prevent the user from pulling the plug off by the flexible, and also to keep the flexible away from the user's arm when ironing. The flexible enters at the side of the connector instead of at the top, the top being used as a grip. Owing to the type of contacts employed, the circuit is made and broken quickly, so that it is quite safe to use this new connector to switch on and off. The handle remains quite cool in operation, being perfectly insulated by reducing the area of metallic contact with the surface of the iron top.

The whole of the components, except the mica and wood handle, are made in the company's works.

Recent Electrical Developments in Glasgow.

By R. HARDIE.

Hiring of Electric Cookers.

The Glasgow Corporation Electricity Department recently obtained sanction to instal in consumers' premises within their area of supply, 200 electric cookers, either (a) on simple hire, or (b) hire-purchase terms. To-day these cookers are at work, and while at this early stage sufficient

Fig. 1.—Gas and Electric Cookers at 19, Westbourne Terrace.

data have not been gathered to warrant anyone dogmatising on the results, it is quite safe to say that the cookers installed are giving satisfaction. Consumers have not shown any anxiety to take advantage of the hire-purchase method, but are content to operate on the simple hire basis.

It may be of interest to recall the circumstances which led the Electricity Department to make this experiment.

Advantages of the Cooking Load.

It is recognised in Glasgow, as elsewhere, that the cooking load is a most desirable one from every point of view. The average cooker will easily yield a greater revenue than an installation of merely lighting, iron, vacuum cleaner or other small appliances. It is, moreover, less subject to abuse than, say, a 3 kW electric fire, which, if left on circuit for a long number of hours unnecessarily, might cause the presentation of a bill which would frighten the consumer.

An electric cooker in use in the average household may be expected to consume from 1 500 to 2 000 kWh per annum, and even at the cooking rate in force in Glasgow and most large towns, forms a very desirable nucleus for a consumer's account. Further, the load in Glasgow, where the midday meal at home is the rule, is necessarily "off-peak." In the opinion of most authorities, this valuable daily, seven days per week, load need not be expected to materialise in the absence of hiring facilities—not even monied people will in large numbers spend from £20 to £50 on the purchase of an electric cooker (plus cost of the necessary wiring). Apart from other reasons, they have been too long spoiled by gas undertakings, who, in their anxiety to secure this remunerative business, do not hesitate to instal any number of gas appliances either free of charge or on easy terms. It was felt, therefore, that in Glasgow, if business was to be competed for on anything like equal terms, the Electricity Department should be at liberty to instal electric cookers on reasonable terms.

Queues for Cookers.

As already stated, the 200 cookers have been installed with ease, and without the slightest attempt at solicitation. The decision of the Electricity Committee to "hire" synchronised with the date of the recent Ideal Homes Exhibition, at which the Electricity Department was represented, and the mere announcement that "Electric cookers may now be had on hire" was sufficient to secure a flood of applications. One reason for the spate of inquiries may be the fact that Glasgow gas is not so good as it might be, nor is its price as low as the public would like. This combination of bad quality and high price undoubtedly contributed to the rapid success of the experiment.

Two types of cookers were installed: (1) The Falkirk Iron Company's No. 5 280/1922, and (2) The Jackson Electric Stove Company's No. 20. These cookers differ fundamentally in several respects, and obviously, in the event of an extension of the scheme, it will be necessary to consider the adoption of a standard type of cooker to ensure cheap and easy replacements of defective or worn out parts.

Hire Charges.

The hire charge is at the rate of £2 per annum, which includes the cost of maintenance. It also covers the cost

Fig. 2.—Electric Cooker at Jordanhill.

of installing the special wiring between the point of supply and the cooker, usually from 10 to 20 yds. in length (consisting mostly of lead-covered cable of 7/20 S.W.G. or equivalent), and the provision of a 30 A switch and fuse to control the cooker independently. A 3-pint electric copper

kettle, with self-contained element, is also supplied as part of the equipment. This is found to be a valuable adjunct to the cooker in the speedy provision of hot water, particularly in the early morning. The wiring has, in every case, been carried out to the order of the Department by local contracting firms.

The Canny Scot.

Cookers have been placed in houses of all sizes. Fig. 1 shows installation in a 3-apartment house in one of the new Government housing areas. This house, which has been occupied for about six months, was at first equipped with a gas cooker, installed as part of the original fittings, free of cost to the tenant. The gas cooker was removed at the request of the tenant, who is now paying the Electricity Department a rental of £2 per annum for the electric cooker illustrated. Within a stone's throw of this house, there are ten others in which electric cookers are installed, in identical circumstances, the tenants throwing out free gas apparatus. In one block of six houses three gas cookers

Fig. 3.—Cooker at Langside Road.

have been displaced in a period of three months and three electric cookers have taken their place. The gas cookers were of the latest type. The gas mains were modern and presumably of adequate dimensions. Yet, in spite of this, these people, without canvassing or pressure of any kind, chose the electric cooker.

Displacing Gas Cookers.

In passing, it may be said that the majority of the electric cookers installed have displaced gas cookers, and the change over was not effected without strong efforts on the part of the opposition to convince the consumer of the folly of meditating any change. In fact, in certain undertakings throughout the country there appears to be a group of selected men whose duty is to interview consumers who request the removal of a gas cooker, and denounce and criticise bitterly everything electrical on the score of prohibitive cost, unsatisfactory service, etc. The average consumer realises the position, and the gas man's errand is usually fruitless.

The original of the following *bona fide* and typical letter has been furnished to me by a representative of an electrical supply undertaking which is in keen competition with a gas undertaking working in the same town.

"With reference to my request for an electric cooker to replace the gas at my house at the above address, I desire to say that a representative of the Gas Department called and endeavoured to convince me that the gas fittings for cooking and heating were much superior to and much more economical than electricity. I felt, however, that he was speaking from a 'gas man's' point of view, and informed him that I had decided to give the electric cooker a fair trial. He has, therefore, promised to remove the gas appliances on Wednesday or Thursday."

Another amusing instance of this type of propaganda can be vouched for. The gas representative called at the residence of one of the cookery demonstrators employed by a certain electrical undertaking, where obviously an electric cooker was at work, and in all seriousness engaged in the customary declamation of electric cooking apparatus. The audience gave him a most attentive and respectful hearing, being glad to have first-hand confirmation of the methods employed.

Old Dogs and New Tricks.

Still another authenticated instance has just been brought to my notice. In this case the consumer was offered a new gas iron, free of charge, on condition that she allowed a new gas cooker to be installed in place of an unsatisfactory one which she had ordered to be removed. It is proverbially difficult for old dogs to learn new tricks and unlearn old ones, but the opinion is widely held that much of the energy expended in trying to sweep back the tide might with profit be directed elsewhere. The arguments now being used against electricity for cooking are on a par with those used against electricity for lighting a decade ago: it costs three or four times as much as gas, etc., etc. They are being used by the same people, and they will prove as futile.

The rate for electricity for cooking is 1d. per unit and gas costs 4/7d. per 1 000 cub. ft., but a reduction in the price of both services is promised in the immediate future. Electricity, therefore, is fighting on advantageous terms.

The 200 cookers referred to may, I think, be regarded merely as an introduction, and there is no good reason why eventually there should not be thousands of cookers connected to the mains in Glasgow. While the stress of competition will doubtless compel improvements in gas cookers, who can place a limit to the development of the electric cooker?

Electrical Homes for Electrical Men.

The slogan "Electrical Homes for Electrical Men" is bearing fruit in Glasgow as elsewhere. Nearly all responsible members of the staff of the Glasgow Corporation Electricity Department can now urge the advantages of electric cooking backed by personal experience in their own homes. The same may be said of many of our electrical contractors. This is as it should be, for how can we make our appeal to the general public until we have by our own example proved that we have a real belief in our own apparatus in complete electric service?

Every effort should be made by electrical men to show their real belief in their own apparatus and in complete electric service. Let at least the salaried employees of all Electricity Supply Authorities, Members of the B.E.A.M.A., the Electrical Contractors' Association, the Electrical Wholesalers' Federation, every electrical manufacturing concern—in short, everyone making his living in the industry, decide at the earliest possible moment to have an electrical home, and the electrical business will receive an immediate fillip.

The "Handilite" Flash Lamp.

The "Handilite" is an inexhaustible pocket flash lamp, just put on the market by the General Electric Company. The source of electrical energy is a small dynamo machine, with permanent magnets completely enclosed in a well-finished and serviceable case, and operated through a train of strong gear wheels by a conveniently shaped lever pivoted to the case. A retaining catch holds the operating handle close to the case when the apparatus is carried in the pocket. A "Bull's Eye" lens is fitted so as to give a concentrated beam, but by removing the lens—which can very easily be done—a wide angle beam can be obtained. The apparatus only weighs 15 oz., and is claimed to be the only lamp of its type manufactured in England.

A Male Mammal at Olympia.

By ALAN SULLIVAN.

I once knew a man who was called by his intimates "Black Alec, the Home Destroyer." He earned this sobriquet because whenever he gained admission to an intimate domestic circle, that circle stood in danger of gradual but persistent dissolution. Black Alec was large in my mind as I walked through the Ideal Home Exhibition at Olympia. He seemed to come back with a conundrum which might be put this way, "Is it the spirit that makes the Home or *vice versa?* Does the thing that one can buy create the atmosphere? Does woman know what she really wants, or does she wait till the male mammal demonstrates the thing?" All through the afternoon I kept on wondering whether Black Alec would have had any chance in a home fitted out with the pick of the exhibits I saw.

The Realities of Life.

You will argue possibly that the two thoughts have nothing to do with each other. That is where we differ. About the only real thing in life is, curiously enough, that which is seemingly unconnected with anything we buy or use, but, in all actuality, is founded on them. I refer to a state of mind, or, in other words, the human factor. And a "state of mind" is generally produced by our surroundings. If you think that this begins now to read like an advertisement for Ideal Homes, you are only partly right. It is merely an attempt to get at the bottom of what makes a home.

There were, of course, to be seen an amazing number of devices—so many, in fact, that they left the mind in a whirl, and one escaped to the Queens' Gardens with thankfulness. Furthermore, if you invested at one booth you were apt to see something more to your taste a little further on. Most exhibitions are bound to suffer from over exhibiting, and the various rooms put up for show purposes generally have too much in them. This is inevitable, and due to lack of space. At the same time I doubt if ever there has been brought together before such an assemblage of things that really help, and against which Black Alec would exert his charms in vain. I think the woman would have been too contented to be much impressed.

What the Electrical Man Knows.

As to the electrical end of it, there was every evidence that the male mammal really did know what his superior half should have to help to make her happy, and had given much thought to providing it. Of all the money that passes over the world's counters, woman spends some ninety per cent. This is a solemn thought for most men, and it seems that the electrical people are determined to hold on to as large a fraction of that ninety per cent. as possible. Had I been a young groom, swelling with primordial pride, and visiting that Exhibition with the fairest creature on earth, there is every probability that my house would have been so equipped that I would have met an early death by electrocution. There were so many appliances that meant sudden cessation of physical effort that one wondered just how long the two million surplus females in England proposed to put up with the old-time and back-breaking way of doing things.

No Need for Dirt.

We take it, and quite rightly, that dirt is the doorstep to disease. There is no reason now why the average home should not be as sanitary as a hospital—and more so. I was not impressed by the exhibitor who poured sand on a carpet—and sucked it up with a vacuum cleaner. Such things don't happen in anyone's home. If the carpet had been in the aisle, and he had cleaned it after a thousand people had walked over it, the point had been better made. But I was impressed by the fact that there is now no reason why a home should *ever* get really dirty. And that stands for a good deal.

The Enemy of Disease.

Another point is light, and here, again, is an enemy of disease. I was talking last week to one of the foremost of British scientists, who dwelt on the therapeutic value of light. It is, seemingly, the sworn foe of certain bacteria without which we are all much better off. Where sunlight is possible it is the most healthful thing in the world; where it is not there is but one substitute. One does not mean that man should bathe in brilliancy, but that both the bodily and mental process are aided by proper illumination. There is in London a glaring instance of how not to do it. I refer to a small shop where unfortunate girls, who will inevitably have eye-trouble—if they don't go mad—are forced to serve customers while intensely bright lights shine directly in their own faces. Charles Brush, of arc light fame, once told me that when his first lamp was exhibited in Cincinnati the public objected to it because it dazzled them. "Do you stare at the sun?" asked Brush. From what I saw yesterday there is no reason why the average home should not be perfectly illuminated.

Washing and "Dry"-ing.

Then there was washing of clothes. Had I been the above-mentioned bridegroom, I should probably have worn two shirts a day for the sheer pleasure of hurling them into an electric washer. It was, perhaps, the most interesting exhibit of all. Behind it moved the indistinct images of women, their arms white with suds, bending over steaming tubs of reputedly clean water and unquestionably dirty clothes. In California, a couple of years ago, I saw bottles of concentrated grape juice, bearing the label, "If you add to the contents three times their weight in water you will be breaking the law." The explanation was that California, being in the first throes of prohibition, was feeling very dry, and had produced some grape compound that gave every heaven-born citizen a chance to become his own distiller. Well, it seemed that those mechanical washers were breaking some unwritten law proclaiming that clothes must not be washed without sweat and fatigue. I am certain that a household thus equipped will have a prodigious weekly washing—and will be much the better off for it—and so will the clothes. Can anything be more distressing to a housewife than to see some husky and high-priced woman exercising all her destructive force on linen which will, as a result, demand mending?

Domestic Secrets Revealed.

So on through cooking, sewing, and all down the line to the curling of hair. What a multitude of things go to make a home! How many of them do we desire, and never knew we needed them till suddenly we found them attainable! As a male mammal I felt almost a sense of shame at the revelation of so many domestic secrets; then realised that they should never have been secrets.

One Kind of Ideal Home.

The average man goes to his office, say, at ten o'clock, reads a few letters, dictates a few more, and it is time for lunch. After lunch he plays fifty up, strolls back to his den of toil, reads the letters he has dictated, talks to people about things in which he is interested, breaks off his duty to sip tea, puts in another hour or so, and turns up at home with an expression suggesting that the situation has been saved—and solely by his personal and intense effort. His wife knows perfectly well that this is a bluff, but he does not know that she knows. She asks solicitously whether he has had a heavy day, and, being assured that this is something less than the truth, immediately forgets her own weariness to make him very comfortable. She has merely done some washing to keep down the laundry bill, supervised the cooking, mended the socks—his socks—bullied the butcher, browbeaten the grocer, looked after the children, put in an hour on a dress with which she hopes to surprise her husband, done her housekeeping accounts—and a few other

things. But for all of this, her face is placid; she does not claim to have saved any situation, and—God save *her!*—she hopes he has not been working too hard. That is the man who says he has an ideal home.

Anglo-Saxon Fair Play.

Here, it seems to me, is where that exhibition at Olympia comes in. It suggests that a good many of us, and perhaps some of those others who take up the collection on Sunday, have rather lost sight of a certain Anglo-Saxon quality of fair play. We accept too much without asking how the thing was brought about. We only see the results, and, because they are good, let it go at that. Not one man in forty could do a woman's work for a week. It is not because his brain is too fine an instrument for such utility, but because he simply has not got the staying quality for small, interminable, and uninteresting duties. Olympia suggested to me an opportunity for giving back—perhaps in a selfish manner—just a little of what we all receive and take for granted. The man who thinks privately that the dearest creature on earth is looking hardly so attractive now as she did when Mendelssohn's March sent his heart into his mouth, might turn this idea over in his mind. If he does so conscientiously, he has the opportunity to really save a situation. If he won't and doesn't, he is three kinds of a skunk.

American Domesticity Through English Eyes.

By MARGARET DYER.

Having recently returned from America I have noticed how very much more slowly domestic innovations have been adopted in this country than over there, and I thought it might, therefore, be of use to readers of The Electrician if I told them some of the ways in which knowledge of new appliances is spread in the United States.

The chief requirement of the English home is comfort, and no trouble is spared by domestic workers to make the home comfortable for the chief resident, the master. In America the master does not hold such an important position; the woman, who, after all, spends all her time in the home, looks more to her own comfort, with the result that ease of working the home becomes paramount. The two aspects are not necessarily antagonistic, but the latter has not received much consideration in the past owing to the ease with which cheap domestic labour could be obtained.

Grades of Residence.

In America there are the same three grades of places of residence as in England: The city, where the living conditions are congested, but electricity is available; the small towns (which may become cities in an incredibly short space of time), where it is usual to have most of the amenities of city life for the home and more space as well; and the isolated farms, which may be very primitive indeed, or, if on the direct line from town to town, may have most of the amenities of town life, including electricity.

The City Menage.

In the cities the majority of people live in small apartments (flats). It is customary for them to prepare their own breakfast by the aid of electric grills or hot-plates, to clean their own apartments by the aid of a vacuum cleaner (which may be centrally installed), and to press their own clothes with an electric iron. The apartments are very small, but in some cases it is possible to find room for an electrical washer. It is customary to lunch and dine out, often in a cafeteria attached to the building, and in the kitchen that supplies the meals are the bigger pieces of electrical equipment—the mincer, the mixer, the potato parer, and the dish-washer.

Electricity in the Small Towns.

In the smaller towns it is almost universal to find the washing machine for the laundry work, the small electrically driven calendar for flat ironing, and the electric iron. Commercial laundries are very expensive, if they exist in these smaller places, and the alternative, hand-washing done by Chinese labour, though cheaper, is not looked upon with favour by many who wash at home without very great labour with the assistance of electricity.

Advertising as a Factor in Development.

There is no doubt in my mind that the widespread use of these machines in a comparatively short time is very largely due to the excellent advertising. There is an enormous amount of propaganda work being done through the schools and colleges that have departments for teaching home economics. (This is the term used to include all forms of instruction given in domestic work.) The standard of living is generally distinctly higher in America than it is in England, but our policy seems to have been of making do with what we have rather than spreading knowledge of better, newer ways. For instance, in large numbers of secondary schools in England, ordinary flat-irons are used because the students have not got, or may not have, electric irons at home. But why have they not got them? Because in many cases they have not heard of them or seen them, and are frightened to use them.

If electric irons were generally introduced into schools, where it is possible to explain something about their construction, this fear would probably quickly pass. A girl guide at a recent laundry test in a large manufacturing town in Great Britain demanded an electric iron. She was provided with it, but the examiner felt she was hardly being brought up in a thrifty manner. But why, in a town of that description, was not everybody using electric irons?

How Manufacturers Can Help and be Helped.

In America a home economics department is usually provided with electrical equipment, free of charge or at a very low rate. Such a place has often only to express a desire for a new piece of equipment and they are offered it on loan for an indefinite period. Or in some cases a new make will be sent to the school in order that its approval may be assured. In one school for training teachers in home economics that I visited, the laundry class were running six different electrical machines (all loaned free), one against another. A really bad machine will suffer from this competition, but for the majority of machines a backing was found. The class seemed to be fairly divided in its opinion as to which was the best machine, and argued amongst themselves as to the superiority of the make they particularly affected. The experience gained by the class of the best manner of using each machine is most useful to the makers, and is often incorporated in the directions given to the public. The great difficulty is to provide a fool-proof machine, and the advantages of having one tried by numerous intelligent, but not specially trained, people are very great.

The manufacturers or store-keepers are also most generous in placing their staff and merchandise at the disposal of the schools and colleges. The class will visit and perhaps be given as much as two hours' instruction on the electrical appliances that are obtainable and the relative cost of running. I think many firms over here would not consider it profitable to spend two hours explaining and giving a great deal of informtion to a class who may not have amongst them the wherewithal to purchase a machine. However, if it is considered what a large number of people may be reached by such a visit, it may be more advantageous than can be estimated.

The "Scrap the Lot" Policy.

The Americans are particularly given to explaining to their English friends that they are a very young nation, and

too much must not be expected. This youthfulness is particularly apparent in their fondness of pulling everything down and beginning all over again. "Scrap the lot" is considered a normal thing to do, and they are perfectly willing to replace old machines with new ones as the improvements take place. In England there is very often great difficulty in obtaining any allowance even on the out-of-date appliances.

Lack of Interest.

Another reason that militates against the employment of electrical appliances in England is the lack of interest in the use to which the article is to be put. A school running its own laundry wished to install electric irons. The local electrical shop was approached and lent some irons for a week's trial. They were then returned, and no order was given, as the workers objected to them as giving so much work. Small irons of a pattern suitable for the householder who does the fine things at home had been provided instead of a heavier iron suitable for expert use. The latter are in use in many places, but in this case did not reach the possible user.

There is a great deal of distrust and conservatism to be overcome in the schools of domestic science in this country, but I believe if manufacturers would do more to help the schools by lending apparatus and helping to interest the students in their possibilities a greatly increased demand would follow.

The Wider Application of Electricity and Electrical Apparatus to Domestic Life.

By ALFRED WILLIAMS, F.R.I.B.A.

Great attention is being given at the present time to the question of "Domestic Economy." This, of course, includes the management of the house, especially in relation to domestic service, which in recent times has been radically changed, not only as to the manner in which the service is rendered, but also in the largely increased cost. Anything, therefore, that can be efficiently and permanently done with advantage to meet these new conditions will be a great public benefit.

Electricity an Immense Gain.

It is the writer's experience that the introduction of electricity into the dwelling-house has proved to be an immense gain not only in the increased cleanliness and in the preservation of decorations on walls and ceilings it permits, but financially, and also in promoting the personal comfort of the occupants and in economy and contentment in the service. Up to the present time, however, excepting in a few instances, the use of electricity has been almost entirely restricted to lighting, though I believe that a further extension of electricity for other purposes would substantially promote domestic economy.

Heating Problems.

The present system of warming a dwelling-house is generally by the open coal fire, which, though bright and cheerful, has the disadvantage of bringing in its train accumulations of dirt and smoke, causing damage and rendering necessary much labour in renovation. The use of a coal fire means that the materials for lighting the fire—wood, paper, and coal—have to be obtained, and then the coal for maintaining the fire must be easily available at all times, if not actually in the room. Even when the fire is alight, the hearth requires attention from time to time to keep it tidy. Afterwards the fireplace has to be cleaned out, the dust removed, the stove cleaned, and the fire relayed. This is all dirty and heavy work, involving considerable labour, whereas with an electric fire all that is required is to switch the current on. There is no preparation beforehand, and no cleaning up afterwards—a very great economy of labour in all ways.

Objections to Gas Fires.

Gas fires have been substituted in many cases, and, although convenient, are not free from fumes and the tarnishing of bright metal objects near them. They also injure decorations by the deposit of small dirt and an oily surface. A gas fire also compares unfavourably with a coal fire financially as regards the attainment and maintenance of a proper temperature in an apartment.

Electric Heating and Cooking.

The manufacturers of electric fires have introduced to the public many artistic and efficient forms of grates at a reasonable cost that can be most easily manipulated, requiring little or no service from the domestic, but at the same time giving a bright, clean, and efficient warmth in the room. As a system of warming, also, it strongly recommends itself for adoption by reason of its convenience and portability.

For cooking purposes useful stoves are on the market. They are very efficient and more cleanly than any other form. The labour in the kitchen is materially reduced. By the adoption of the numerous small appliances which can be placed on a sitting-room table for egg and water boiling and bread toasting, etc., service is again greatly reduced.

Advantages of the Vacuum Cleaner.

For carpets, curtains, chair seatings, etc., the electric vacuum cleaner is a great acquisition, more efficient in its work, is quicker, and effecting much saving of time. Here, again, a great gain to domestic economy. Where it is possible to have a laundry in or near the house remarkably efficient machines for washing and wringing clothes can be readily worked by electric power, and the electric iron cannot be too highly recommended. Electric power may also with great advantage be applied to a sewing machine, leaving both hands of the worker free, effecting a saving of time and improvement in the work executed. In cases where the kitchen is in the basement below the dining-room floor, electric power attached to a dinner lift would facilitate the service at the top and bottom.

To the above list may be added electric bells and internal telephones from sitting-room, etc., and the principal bedrooms, giving instant communication with the servant, economising her time and journeys for attendance. The introduction of automatic switches on all doors to dark storerooms or closets would avoid the loss of time in hunting for matches and candles.

Architectural Necessities.

Of course, to obtain all the advantages above described a complete installation must be made. The wiring should be duplicated and sufficient capacity as carrier of current to all the fittings, and care taken in all the connections for fittings.

The cost of current taken from a public main must, of course, be taken into consideration, and would probably be thought by many to be prohibitive to its adoption, yet it must be remembered that a very great saving in the housing, boarding and wages of domestic services would be effected, and in many cases halved. Should, however, current be obtained from a private dynamo the cost of the extension of its use would not be so largely increased.

In addition to the comfort to the occupants of a house completely installed by electricity as above enumerated, which would be great, the writer, who is much interested in the subject and has had considerable experience in dealing with residential property, has no hesitation in saying that in his opinion a medium-sized house suitable for occupation of members of the professional classes well and suitably equipped as indicated above would be more readily disposed of should it be placed on the market

The Use and Future of Electrically Equipped Furniture.

By EARL E. WHITEHORNE.
Commercial Editor, "Electrical World."

Electrified furniture is something new under the sun. It was talked about in 1915, but during the war there was no time to think of it. Last June, however, the subject was revived by Mr. J. F. Becker, sales manager of the United Electric Light & Power Company, New York. He exhibited a full set of miniature household furniture before a meeting of the N. E. L. A. Commercial Section executive committee at Association Island and discussed the situation. He was appointed chairman of a committee and received an appropriation to develop a set of specifications for wiring furniture. Mr. Becker thereupon, at the expense of his company, proceeded to purchase and electrically equip a complete set of household furniture, which was exhibited first at the New York electrical show last autumn and thereafter in the furniture departments of various large New York department stores. Electrified furniture, therefore, is not only being talked about; it has been produced.

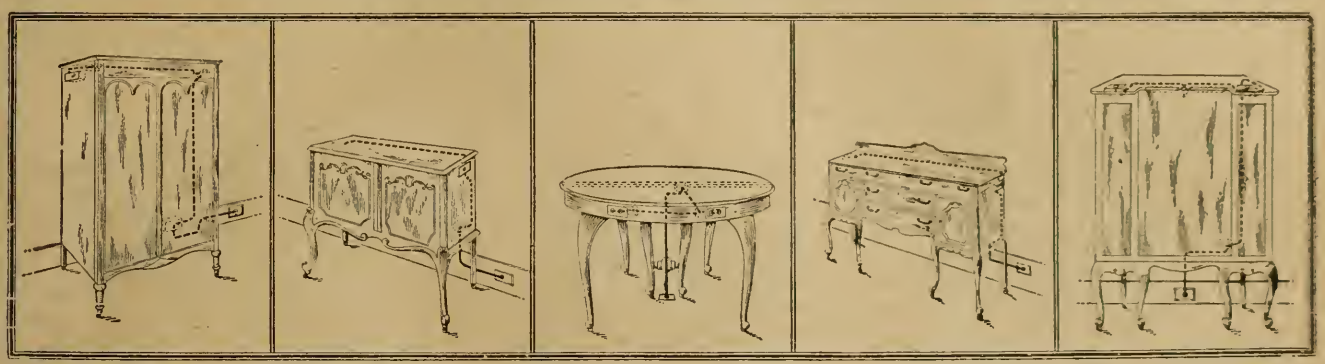

FIG. 1.—SCALE DRAWINGS OF THE "CHIFFEROBE," SERVING TABLE, DINING TABLE, BUFFET AND CHINA CLOSET.

What the Furniture Man Thinks of It.

Now, the point that interests me most about this idea is not what the electrical man thinks, nor even what a woman says when she first hears of it. It is the opinion of the furniture people. For they know furniture. And they have said that the electrical equipment of household furniture is a real inspiration which is going to win a great popularity. Mr. R. Braun, president of the New York Furniture Exchange, has put it this way:

There is no doubt in the world that electrified furniture will sell, provided only that the cost of electrifying it is brought down to a proper level. I believe that the furniture trade will welcome this innovation. It will provide a style appeal that should produce much business. I believe that electrified furniture has a big future.

The Right Idea.

Therefore, as far as the furniture aspect is concerned, the idea is apparently right. Electrified furniture will sell. And it will sell even though some men and women when they first hear about it are not enthusiastic. Furniture has never been electrified, and the thought is somewhat startling. They do not at once see the necessity for it. But, by the same token, the use of electrical appliances is in itself new, and this further step in making their use convenient will not be thoroughly understood until it is explained. It is an idea that at first will have to be "sold."

Inherent Inconveniences.

All electrical appliances, of course, have one inherent and unescapable feature of inconvenience. They must for ever be attached to the electric outlet while in use. If there are not an adequate number of conveniently located outlets to which the fan or toaster or heat pad may be connected, it is not easy to use them, and from the beginning that has been a serious obstacle to their habitual use and popularity. People naturally want to use these devices right where they happen to be sitting. The grill, the percolator and the other small cooking appliances are commonly used at the dining table or the sideboard. The vibrator, hair dryer and curling iron are commonly used at the dressing table. The fan is almost always standing upon a bureau or sideboard or table. The heat pad and bottle warmer are needed usually beside the bed. The convenience of the vacuum cleaner depends upon being able to plug it in at any point where you want to clean. But few houses, at present, have more than one or at most two outlets in the principal rooms, and most of these were installed before the furniture was in place and are not as handy as they should be.

Provides More Handy Outlets.

There is the condition. And the equipping of the furniture itself with convenience outlets is the best idea that has ever been suggested to relieve it. For in this way we can automatically provide a large number of additional receptacles exactly where they can be reached most easily at the precise point where they will always be wanted, no matter how the furniture is moved. Each piece of furniture connects by an attachment cord directly to the house wiring by plugging into a socket, and its own more accessible receptacles are used to connect the appliances by short cords. There is no stooping down therefore each time some device is to be used. The bed or the table remains plugged in.

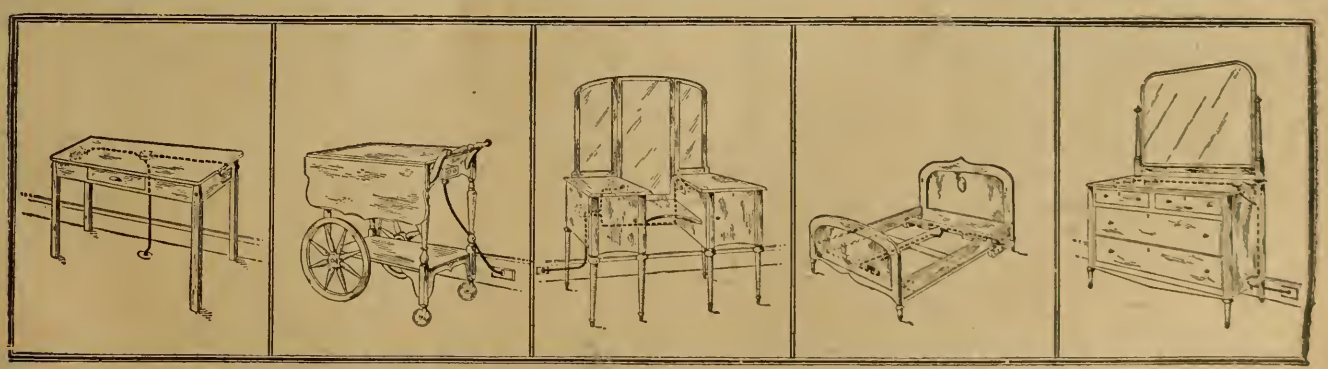

FIG. 2.—DIAGRAMS SHOWING HOW THE KITCHEN TABLE, TEA WAGON, VANITY TABLE, BED AND DRESSER WERE WIRED.

There are ten pieces of walnut furniture in the model set which has been prepared by Mr. Becker's company. The photographs and diagrams reproduced here show how the receptacles have been installed, although to make them visible in the half-tones it has been necessary to make these receptacles more prominent and conspicuous. The purpose in wiring each has been very definite:

The Bed.

The bed is provided with three receptacles, placed under the left-side board at the head of the bed to connect a heat pad, the bedside lamp, the fan, the baby's bottle warmer, or a grill for the bedside breakfast. In addition, a toggle switch operates a lamp beneath the bed which illuminates the floor sufficiently to make it comfortable to walk about without disturbing a sleeper or making the interior of the room visible from outside. All this equipment has been

attached to the one section of the bedstead, so that the bed may be taken apart without interference with the wiring.

Chifferobe and Dressing Table.

The "chifferobe" has two receptacles for the convenience of the man, and they are often needed when this piece of furniture accepts the darker corner in deference to the greater needs of the dresser. They provide for the connection of a boudoir lamp or a shaving lamp, a fan or an electric clock, and the warbrobe section is automatically lighted as the doors are opened.

The dresser has four receptacles to connect two candlesticks or a boudoir lamp, a violet ray, or vibrator or hair dryer or curling iron or fan.

Vanity and Sewing Tables.

The vanity table has two receptacles for use with any of the appliances mentioned in connection with the dresser. The wiring of the sewing table is also suggested where it is desired. Two receptacles can be installed for use in connecting a flat iron for pressing work, a lamp for evening sewing, the sewing machine motor, or a fan.

FIG. 3.—VIEWS OF "ELECTRIFIED FURNITURE" EXHIBITED AT THE NEW YORK ELECTRICAL SHOW.

The Dining Table.

The dining table is undoubtedly the one article of furniture most greatly in need of its own wiring. Although it is not usually possible to operate more than one table appliance at a time owing to the excessive load, as a matter of practice it is not necessary or customary. The percolator is started as soon as the first member of the family comes in to breakfast, or by the maid before that. By the time the fruit and cereal are finished the coffee is done and the grill or toaster has come into service. So only one appliance is needed at a time, but to be convenient it should be possible to disconnect the one and connect the other without getting up, and this is rarely possible where the table itself is not wired.

Too often an indirect-lighting fixture over the dining table makes it impossible to connect an appliance without running a tangled cord across the rug and risking an unwary foot that may jerk the toaster off the table ; and the attachment of table appliances to any type of lighting fixture on the table is an abomination because the hanging cords are both unsightly and troublesome. A wired table, however, may be connected to a floor receptacle through parted fibres in the rug, and the appliances, with shortened cords, are plugged into the receptacles in the skirt of the table. Meanwhile the lighting arrangements are not disturbed.

Buffet and Serving Table.

The buffet is fitted with two receptacles which may be used for connecting electric candles or any cooking appliance which might be operated by the maid at the sideboard or at the table. Also in summer a fan often stands here.

The serving table is equipped in the same way as the dresser as an alternative or supplementary convenience for attaching the same appliance or candles.

China Closet.

The china closet is wired to provide light with both an ornamental and a utilitarian purpose. Beautiful glass and china is most attractive when lighted and low-powered tubular lamps within a cabinet bring out the fire of cut and iridescent glass and the colouring of china most effectively and without undue display. This light also serves to prevent breakage when glass is being taken out or put back by making it easier to gauge the space and distance. On the top of the china closet are two receptacles to connect a fan or clock.

Tea Wagon.

The tea wagon is another case where wiring has a great practical value. The wagon is taken about the house to any room or on the porch, to be used beside the fireplace or at the chair where the hostess may be sitting. On it may be a samovar or percolator and also a chafing dish, grill, toaster, or waffle iron. Yet seldom is it convenient to connect two appliances and perhaps a little table lamp just at that point. With a wired tea wagon the attachment cord is carried to the nearest baseboard outlet and the appliances, with shortened cords, plug into the tea wagon's own two receptacles. A hook is provided to coil the wagon's cord when not connected.

Kitchen Equipment.

The kitchen table is the main domestic workbench, and more and more electrical equipment is becoming available for use on it. Two receptacles have been installed to connect the electric mixer, the grinder, the polisher, or the flat-iron. The kitchen cabinet has two receptacles for connecting the same devices listed above for use on the table and in addition a heating receptacle for attaching a flat-iron or a fireless cooker.

Future Developments.

In the equipment of this original set of electrified furniture, of course, it was necessary to use available standard fittings which are in many cases larger and more conspicuous than are appropriate. New fittings for furniture will undoubtedly be developed having smaller plates and other characteristics more suitable for this use, and this will naturally stimulate the wiring of furniture. One leading furniture manufacturer has said that if smaller fittings were available he would begin to electrify his dining-room tables, tea wagons and some other pieces at once, and other producers will follow suit. It offers both the maker and the dealer a new style in furniture, a new idea that can be talked about and advertised and sold. It is something that they all want and will gladly push. And every sale of wired furniture brings more outlets into some home. more places to use appliances, and nothing influences the purchase of more appliances so much as a handy waiting outlet. Such a piece of electrified furniture will add from one to four more outlets and increase the use of every kind of a household device.

A Big Idea.

It is a big idea, and it has a big future, and electrical men will do well to push it energetically. To-day it sounds like a radical innovation that will not have wide popular appeal, but the furniture man knows better than we do about that. Motor cars were considered complete before the first self-starter came, but we know now that a car was but half an automobile as far as convenience was concerned before that further refinement was introduced. We are going to find that wiring will bring just this kind of a convenience to our furniture and that people will adopt it gladly once they see how much it will do for them in comfort. And the electrical industry will benefit tremendously.

The Helsby Twin Wiring System.

The call, apparently, is still for surface wiring systems, and there are not lacking those who are willing and anxious to reply to the demand. Among the latest ways of surface wiring is the Helsby twin wiring system produced by the British Insulated and Helsby Cables, ltd. This system, of which the salient features are shown in the accompanying photograph illustrating a demonstration board, is, it is claimed, suitable for both direct and alternating current supply, and comprises essentially single, twin or three-core rubber insulated metallic sheathed wires and a range of fittings and accessories for fixing and using them. The single wire is of circular section, the twin and three-core having a flat section. In all cases the metallic sheathing is composed of a special metal alloy of considerable strength, which, without impairing flexibility, provides a good protective covering for the cable and prevents sagging. It is claimed that the whole system is quickly and cheaply erected with a minimum of labour and that no special tools are required.

Details of the System.

The fixing clips which can be seen in the left-hand top corner of the exhibition board are composed of tinned brass with countersunk holes so that the head of the fixing screw is flush with the clip. The fixing saddles which are shown below them are also of tinned brass drilled with holes to take a No. 3 wood screw. The junction box which is shown in its normal position at the right-hand bottom corner of the board and in an inverted position at the opposite bottom corner comprises a tinned brass back plate, an annular bonding clamp of special alloy and a tinned brass cover. The back plate is placed inside the annular bonding clamp, and the whole is secured to the wall by means of a screw through the whole of the plate. The bonding clamp has four slots, so that it may be used as a two, three or four-way fitting, continuity of the metal sheathing of the cable being secured by screwing down the small clamping pieces on to the sheath. The metal of the bonding clamp is of the same composition as that used for sheathing the wires, and cables and the slots can easily be opened out when it is necessary to use a larger cable than 7/0·079 flat twin.

An important point is that there are no loose screws or small loose parts to worry about, as the fittings are all supplied assembled, and it is never necessary to completely remove any of the screws. The covers for the fitting are simply sprung on to the base portion so that simplicity and easy erection may be said to be outstanding features of the system, among whose advantages the makers claim that it is inexpensive, easily and rapidly erected, needs no bolts and thoroughly efficient electrically, and requires no special tools.

How the Helsby Twin Wiring System Works.

Modern Wiring—The Surflex Safety System.

By L. M. WATERHOUSE.

For the past twenty-five years the screwed metal conduit system may be said to have been standard practice in this country, but owing to the high cost of material and increased labour charges wiring development has been very much restricted of late years, as would-be consumers are not in a position to pay the prices demanded. Undoubtedly there are many cases of installation work where the conditions demand mechanical protection of the high order afforded by metal conduits, but there are a much larger number where such protection is superfluous, and where a heavy metal system entails

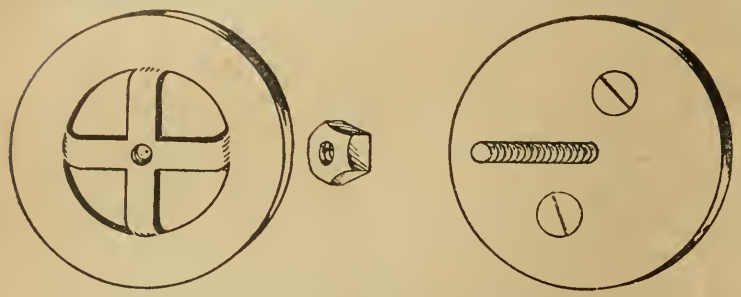

Fig. 1.—The Surflex Base and Pressure Plate.

an upheaval and upset of working conditions that is unnecessary. In the majority of private houses and business establishments considerable economy could be introduced without in any way adversely affecting efficiency.

The Economy View Point.

The question is how to bring the economy axe into operation without affecting efficiency. An analysis of wiring costs clearly demonstrates the increased cost of material as well as labour, but in reference to conduits themselves, the increase is not marked, but the many costly component parts which go to make up a conduit system render it almost prohibitive except where conditions demand solid mechanical protection. It is these boxes and fittings which affect the question to such a degree and inflate the wiring costs to such an appreciable extent. It is clearly in this connection that we must look to effect the saving, for, so long as high-class screwed conduit work remains in the vicinity of £3 a point, so long will development be retarded. Another factor that cannot be overlooked is the high price charged for energy by many supply companies. In most cases, a considerably lower scale is offered for heating, cooking and power circuits, but the present high charges for wiring practically prohibit such new circuits being installed, and consequently the development of domestic appliances

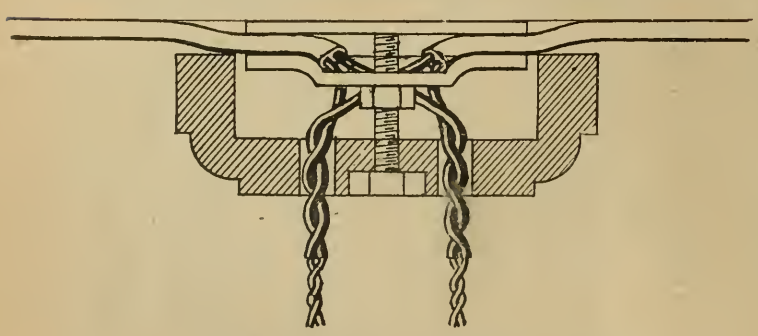

Fig. 2.—Wiring at a Lighting Point.

is retarded. I suggest that if the Electrical Development Association concentrated their attention entirely on the two factors—reduced installation wiring costs and reduced rates for energy both for lighting and heating circuits, they would do more effective service to the development of electricity in this country than by the consideration of methods of salesmanship, and by endeavours to educate a public which cannot afford to be educated so long as the present rates exist.

Slow Development of Surface Wiring.

For some years past, lead-sheathed and solid-rubber-sheathed wires and cables have been produced for surface wiring by some of our leading cable makers, and they have met with a measure of success owing to the marked economy of such methods of wiring, both in prime cost and in simplicity of erection. It is also found that the protection afforded is more than sufficient to meet most installation requirements, and they have the advantage of being free from all condensation troubles, are not unsightly or cumbersome and are easily and expeditiously erected without specially skilled labour and, a most important point, their erection causes a minimum of inconvenience and disturbance to decorations and interference with the work of a household, office or works. It is somewhat surprising that development along these lines has not been more rapid and pronounced, but whereas the conduit system has been elaborately developed, possibly too far extended in its large range and multiplicity of fittings, these sheathed-cable systems have, to a large extent, been neglected in the direction of useful accessories. It is true there has been no dearth of actual boxes, but the majority of them are not mechanical, being too often composed of thin metal stampings with separate bondings for each wire, with many small nuts and screws, and they have therefore not appealed to engineers as a sound mechanical proposition. The boxes for solid-rubber-sheathed cables being usually manufactured of moulded materials are also lacking in mechanical strength; in short, those wires and cables which possess marked advantages both as regards efficiency and economy have not been converted for want of sound accessories into a concrete system of wiring.

A New System.

To meet the present day requirements of economical yet efficient wiring, the Surflex Safety System has been introduced. Although still a staunch upholder of conduits for installations necessitating stout mechanical protection, I am of opinion that, for the majority of installations in private houses and public buildings, a decidedly less costly, yet nowise less efficient method of wiring can be installed

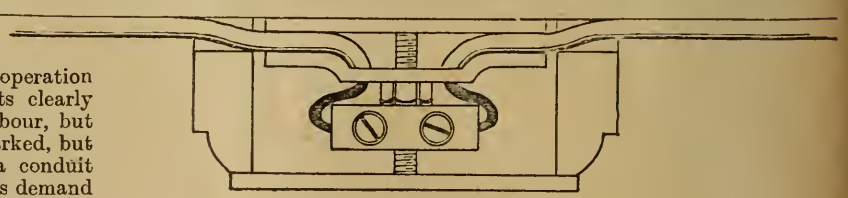

Fig. 3.—A Straight Through Connection.

either in its entirety or in conjunction with conduits, a pronounced saving being found in connection with all sub-distribution work.

Details of the System.

The Surflex Safety System consists of universal metal bonding and insulating fixing plates and boxes for use with all metal-sheathed or solid-rubber-covered wires and cables—single, twin or three core, circular or flat. The metal plates can be employed for both lead and solid-rubber sheathed, the insulating variety being for rubber sheathed only. In all cases wires can radiate to and from the plates at any desired angle relative to each other. The bonding is secured by direct pressure of a single nut on a central stud, and this pressure bond is lasting, so that all strain is taken off the terminals.

The base plate being fixed in position, the pressure plate when screwed down fixes the position of the circuits, the wires being held in position whilst the necessary connections are being made. Surflex plates form the basis of all points, whether they are lighting or switch points, junctions or connections. In the former case they are used in conjunction with an accessory mounting wood block for the 5 A type of fittings, and with a fibre box for the 3 A accessories.

Suspensions and Bondings.

Two other features of the Surflex System claiming attention are the Surflex adjustable suspensions and Surflex adjustable bondings. Surflex brass suspensions are small sleeves made from drawn brass tube, through which extruded lead strip is drawn in a bight after encircling the single or multiple circuits; the bight is then drawn tight and a screw through the centre of the sleeve secures the circuit in position. These suspensions can be used in a variety of ways, such as for multiple saddles. The Surflex bondings are a development of the suspensions, but the wood screws are replaced by No. 3 BA bolts, nuts and washers, and they can be employed with lead strip or tinned brass strip. The use of Surflex suspensions and bondings is not confined to lead and solid-rubber-sheathed wires and cables, but they can be usefully employed in connection with conduit runs and all metal circuits, and they form a very convenient method of bridging across a wood block used on a conduit run.

The whole system is condensed into a few parts, the idea being to provide the contractor with a complete outfit to carry out his installation wiring with a minimum of stock outlay, to enable him to save time so often expensively lost in these jobs and to complete any installation according to contract.

The Home Idealised.

(*Concluded from page* 349.)

Fresh Falkirk Apparatus.

The electrical part of the FALKIRK IRON COMPANY'S stand consisted of a model electric kitchen which contained their No. 5 280 domestic cooker, together with a wash boiler, kettle and iron. This cooker, of which we give an illustration (Fig. 11), has been designed to meet the needs of the modern home occupied by a small or medium-sized family, and it has already received a wide application,

FIG. 11.—THE LATEST FALKIRK COOKER.

especially in Glasgow, as will be seen from Mr. Hardie's article which is published on another page of this issue. It has ample oven accommodation, two radiant type boiling burners and a griller and hotplate with switches and fuses, thus forming, it is claimed, a compact and reliable cooker at an extremely low price. It is worth noting that the head is hinged at the back and so can be easily lifted to expose the whole wiring. The oven is ready for toasting or baking within twenty-five minutes of turning on the high heat.

Another interesting piece of apparatus on this stand was the double ray heater and toaster. This transmits heat over an angle of 100 deg., thus distributing rather than concentrating the heat. It effects this with a small loading of 600 W, and from it not only can room heat be obtained, but toasting can be easily effected with good results. Moreover, it is a handsome piece of apparatus, being made wholly of polished copper, with brass trimmings, ebonised handle and fibre legs. It weighs less than 2½ lb. and can be readily attached to any lamp socket and conveniently placed in the trunk for travelling.

Western Washers.

The star turn on the WESTERN ELECTRIC COMPANY stand was the combined dish-washer and kitchen table. This equipment consists essentially of a sheet-iron chest mounted on legs so as to be at a convenient height for the worker. The top of this chest is divided into two parts, the larger of which is hinged and acts as a lid which can, however, be held securely in the open position when dishes are being placed in the interior. The lid is very thin and flexible, so that there is no danger of kinking, and the whole is finished in enamelled iron, and is therefore easy to keep clean.

The electrical portion of the apparatus consists of a motor-driven paddle which sprays two gallons of hot water over the crockery in three directions. The dishes must be scraped before they are put into the washer, and are then kept separate from each other in wire racks, so that there is no danger of chipping or cracking owing to mutual contact. Separate holders are provided for the silver-ware. When washing is completed a continuous spray of hot water rinses, the articles; if the water is hot enough drying takes place automatically. The washer is provided with a drain so that the plates can be left in the trays to dry.

Washing Day Simplified.

The Western clothes washer was also prominent on this stand. It consists essentially of a hard maple revolving cylinder, which is perforated round its periphery so that soapy water is driven on to the clothes inside. This cylinder is operated by a ¼ H.P. motor through an ingenious arrangement of gearing and dog clutches, which cause it to reverse its direction of revolution once every 6½ revs. A friction clutch ensures that if the cylinder is overloaded the motor runs free and no damage is caused. A safety device is fitted within easy reach, so that if any accident occurs the motor can be immediately shut down. Combined with this washing machine is a wringer which is driven from the same motor, the latter being of sufficient size to allow both wringer and washer to be operated simultaneously. This wringer can be operated in any direction.

The motor is tucked away under the washer, and is well protected against damp or drips. Incidentally it is provided with a spare pulley so as to allow it to be used to drive a small unit for other work. The washer is mounted on castors and can easily be moved about for filling or emptying.

The Western ironer consists of a 46 in. roller, which can be either electrically or gas heated, and there is, in addition, a ruffling attachment for dealing with collars and cuffs that cannot easily be operated on a straight roller. The ironer has both foot and hand control, one of whose features is that the roller can be entirely disconnected from the driving circuit and moved round easily by hand for the preliminary arrangement of material. After the material has passed through the ironer it falls in even folds on to a special dropping board underneath.

Touchbutton House Translated.

Aladdin's genie has been at work, and for the time being Touchbutton House was transferred to Olympia, and in a very creditable, though condensed, form attracted numerous visitors to

FIG. 12.—A NEW "MAGICOAL" FIRE.

No. 106 stand. This is not surprising, because Touchbutton House the Second contained a very complete display of electric heating, cooking, and plate-washing and clothes-washing apparatus of the

FIG. 13.—THE "MULPARVO" WASHING MACHINE.

kind with which BERRY'S ELECTRIC, LTD., have long tempted the electrical and lay public. It is hardly necessary to add that the Magicoal fires, one of which we show in Fig. 12, and the Colex

system of house heating were given considerable prominence among most artistic surroundings.

In addition was to be found the Mulparvo electric servant, an apparatus which will do practically everything that is required in the kitchen and its subsidiary places, from plate washing to laundry work, including brass polishing, batter mixing, cake making, ice cream freezing, meat chopping, and boot polishing. This machine is very compact, being 41 in. by 24 in. by 34 in., and is illustrated in Fig. 13.

Another new invention which was on show is that devised for table glass decoration for fruit and flowers. This brings into play all the beautiful coloured effects of the solar spectrum in their proper sequence so that the illuminated fruit and flower vases are continually changing their appearance.

The "Ventiheta."

The Ventiheta, which was shown by the Ventiheta United Kingdom, Ltd., is an apparatus for supplying a constant stream of fresh warm air to the interior of a building. It is claimed that those who use it will not only escape draughts, but have the pleasure of living in an even temperature. It seems worth trying not only from this point of view, but because it gives no obnoxious fumes or smells. We can understand this when the electric model is used, but we beg leave to doubt it if gas or oil is the heating agent. As our illustration (Fig. 14) shows, the whole apparatus is strongly constructed in sheet iron, which is finished artistically to comply with various forms of decoration. The height is 4 ft. 6 in. and the base measures 13½ in. by 10 in. The electric model is fitted with four Genii glowers with regulating switches adjusting the consumption from 0·5 to 2 kWh per hour. It is stated from 2 000 to 5 000 cub. ft. of fresh-warmed air are induced hourly by convection.

Fig. 14. A Typical "Ventiheta."

The Blue Bird washing and ironing machines shown by the Blue Bird & Simplex Electric Company at least has an attractive name, and if their operation is only half as attractive from the point of view of the company the exhibition should have been an entire success. It is claimed for the Blue Bird that it washes clothes spotlessly white. Perhaps this is because the tub is very large and is made of copper tinned inside. This tub is given an oscillatory motion and cleansing is effected entirely by the action of water and soap. The tub is controlled by one lever alone and can be drained by pulling up a flexible rod. It is stated that it is possible to wash £1 sterling worth of laundry in fifteen minutes, while the equivalent of 120 table napkins can be ironed in the course of one hour without fatigue.

Hotpoint Appliances.

The Hotpoint Electric Appliance Company's stand should have appealed strongly to the housewife who is interested in time and labour-saving appliances. Here was to be found a range of all the well-known Hotpoint domestic electric appliances, including electric irons for all sorts of uses, and one we especially noticed was adjustable to any voltage. Turning to a rather more attractive question we find many elegant designs of Hotpoint electric tea kettles, teapots, and coffee percolators all fitted with automatic safety switches which are self-operated if the apparatus is inadvertently left on circuit, and can be re-set merely by pressing a catch. We must not forget electric toasters, grills, immersion heaters, bed warmers, fires, sewing machines, &c., all equipment tending to make the home more comfortable and the housework lighter. This being the aim in view, a special display was somewhat naturally given to the latest model of Premier electric suction cleaner which embodies a sensitive beater device by means of which the carpets are beaten gently and rapidly at the same time as they are cleaned by powerful suction. Then there is the Acrobell electric clothes washer, which embodies the vacuum comb principle whereby the soapsuds are forced through the clothes, thus loosening and removing the dirt without scrubbing, and then again, there is the Walker dish washer, which not only saves labour but breakages as well—altogether a representative exhibit of how electricity can assist in solving the domestic problem.

What "Z" Means.

The "Z" Electric Lamp & Supplies Company, Ltd., had a very complete exhibition of their indirect lighting bowls, panels, friezes and plaques. The bowl fitting exhibited has been introduced to overcome the dead and unsightly effect of the ordinary metal indirect lighting fittings. It is formed from plaster castings to which, by a patent process, the property of translucence is given. The casts are reinforced by fabrics, and consequently any flower or other colours desired can be introduced into the fitting. By day the bowl has the appearance of white marble, but when illuminated the colours become visible with very beautiful results. The bowl retains a soft degree of opacity to prevent the coloured rays entering the room so that a perfect white soft diffused light is, it is claimed, obtained. The panels and friezes, which are also translucent, are highly artistic, and when illuminated the results are most effective, especially for the decoration of cinemas and public halls, &c.

Panel Warming.

Richard Crittal & Co. had on view examples of their panel system of warming, which has been designed to obtain the full effect of radiant heat with all its advantages in contradistinction to local warming by convection. It is claimed that by this method not only may walls, floors, and ceilings be heated in a simple and unobtrusive way, but that curtains, screens, footstools and quilts, and even chairs and settees may be used as heat transmitters, and so form an efficient and convenient supplement to other methods of heating. Only extremely low temperatures are employed, and the maintenance of the apparatus is therefore claimed to be negligible.

More Washing Machines.

The Northern Steel & Hardware Company were showing their "Laundry Queen" electric washing machine which, it is claimed, will wash all the clothes of an ordinary household at a cost of under 2d. for electrical energy and, what is more, wash them better and cleaner than can be done by hand; while, thrown in as a sort of makeweight, it will wring, rinse them and blue them—in fact, do everything but place them on the line. All these wonderful things are done without damage to the clothes, owing principally to the gentle action of the dolly, which passes hot soapy water through the mesh of the clothing.

The wringer which is fitted has an automatic adjustment so that it will take any thickness of material, and can be swung to any position, so that the wringing of one batch of clothes can be done whilst the second is being washed.

Also on this stand was the Northern electric vacuum cleaner, which performs all sorts of useful cleaning operations. It works not only by suction, but when reversed blows dust from heavy pieces of furniture such as wardrobes and sideboards.

Floor Polishing.

The Electrolux floor polisher is, as its name implies, a useful piece of apparatus, which has been particularly designed to do away with a particularly back-breaking form of domestic labour in medium-size houses. Its loading is only 140 W and it can therefore be run from any lighting circuit. The power of the motor is ⅛ h.p., and the speed is 7 000 revs. per min. Two sets of brushes are provided, one with hard bristles and one with soft bristles, and in both sets there are two parts which run in reverse directions, the outer brush running at half the speed of the inner brush.

Spring Cleaning Simplified

The Electric Suction Cleaner Company (proprietors, Scholey & Company, Ltd.) were exhibiting their well-known Croydon electric vacuum cleaner, which, it is claimed, provides an example of one of the latest features of electric vacuum cleaners, which is wholly British made. The machine is standardised for all voltages, and demonstrations, which attracted a good deal of interest, were held at frequent intervals.

The Hoover Suction Sweeper Company were showing their well-known equipment, a distinguishing feature of which is that it beats the carpets as they lie on the floor, sweeps them electrically, and cleans them by air. Its utility is not confined to carpets, however, and it will with equal effect clean curtains, hangings, upholstery, clothes, etc., without raising any dust. In these spring days a cheap way of getting one's carpet cleaned is to register your name with the Hoover Suction Cleaner Company, and they will give you a free demonstration in your own home on your own carpet. How they make a profit out of it we don't know.

Gillespie & Beales were showing a number of their "Nilfisk" electric suction cleaners; while an excellent range of electric labour-saving appliances, including several types of electric vacuum cleaners and a fine range of portable electric cleaners for all purposes, were shown by Duncan, Watson & Company. On this stand were also to be found the "Rotapex" electric clothes washer and double ironer and the Alafort electric gramophone. Play a tune while you wash—not a bad idea!

The Aster Engineering Company were showing one of their 25 V British light semi-automatic country-house lighting plants complete with 170 A hour 13 cells storage battery, the engine in this case being arranged to run on town gas. Automatic pumping sets for country house work were also to be found.

Studebaker, Ltd., were exhibiting the well-known Lalley power plant, of which many thousands are in operation to-day in country houses and other similar places.

Electrically-driven sewing machines were to be found with many interesting attachments on the stand of the Singer Sewing Machine Company, Ltd.

The Eureka vacuum cleaner, which is distinguished by having 2 mile a min. suction and thereby is capable of doing all household cleaning of carpets, hangings, beddings, &c., was shown by the Electrical Appliances Company.

An Electric Conduit and Pipe Clearing Device.

By E. GEORGES CHEUVREUX, Jr.

Few effective methods are available for blowing down obstructions in pipes, particularly electrical conduits, that are placed in the walls or other positions during the construction of a building. Most of these conduits are laid in position before the cementing or plastering is completed, and during the time that such work is being accomplished. Experience shows that it is not practical to cap the ends of these pipes, although sometimes wooden plugs or waste rags are placed in the exposed ends, but oftentimes these plugs or rags, or cement are forced into the tube to such an extent that when the pipe is sealed into position by the completion of the walls, the pipe is practically useless, until a great deal of labour has been employed to extract these obstructions.

There is no tool made at present that can be placed in the tool kit that will work effectually against all clogging in pipes. In many cases, conduits have had to be abandoned and others erected.

An American Device.

A device has, however, been patented in the United States, and will probably be placed on the market in the near future, that will blow down any foreign matter in conduit, such as wooden plugs, waste, cement, plaster, and even ice. On a test it blew through 200 ft. of conduit, and round the elbows, and carried before it all the obstructing material. The principle of the device is concussion, and the tool itself is simple in construction, easily handled and safe. Conduit is usually provided with screw threads on the exposed ends to which fittings are screwed. It is on these exposed threaded ends that the device is attached.

Details of the Device.

Fig. 1 shows a fitting which may be a casting finished in black enamel or galvanised, or it may have its exterior knurled. Fig. 2 shows a sectional view and details of the device. The interior of one end has screw threads (2) while the other end is reduced and provided with screw threads (3) and (4). Communicating with (2) is a small bore (5). Member (6) is similar to member (1) and is also provided with screw threads (7) into which member (1) is screwed. Member (6) is provided with a reduced portion (8), having a longitudinal passage through which the firing pin (10) passes. The firing pin consists of a knob (12) and a firing point (11). The knob or firing plate is screwed (13) to the pin itself. The pin operates freely

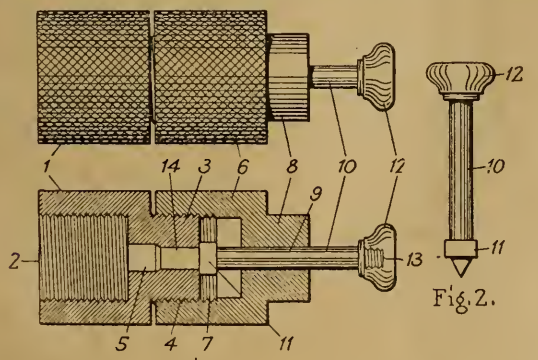

Fig. 1.—Diagram of Pipe Clearing Device attached to Pipe.
Fig. 2.—Sectional View and Details.

in the passage (9), so that there is no effective pressure until it is required. There is also a spring used on the firing in, so that it rebounds after discharging cartridge, but this is not shown in the sketch.

The Operation.

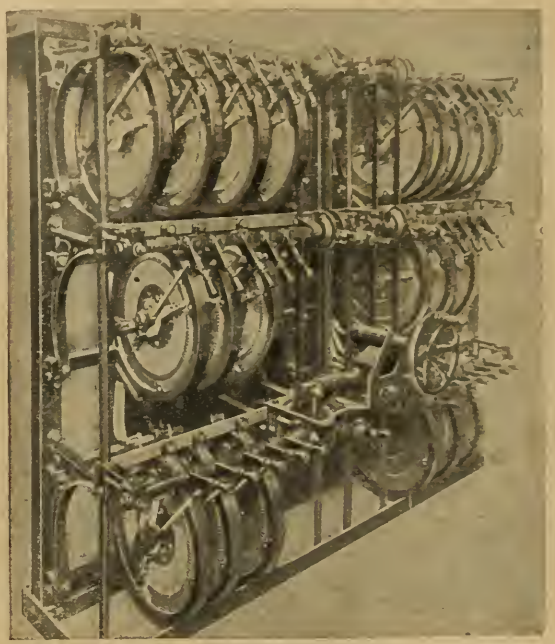
The device is operated as follows: Member (1) is screwed to the pipe, and this member can be made any size to suit the diameter of the pipe, and can be used on two sizes of pipes by means of reducers, and also on elbows or any fitting attached to the pipe. A blank cartridge (14) of 0·32 calibre is then placed in the passage (5) with its flanged end resting on the face of the passage. Member (6) is then firmly screwed to this, and a blow of a hammer on the knob will explode the cartridge. The explosion in the pipe will cause sufficient pressure to blow out all foreign matter. If a single cartridge does not accomplish the work effectually, a second or even a third cartridge may be used, but as a rule it will be found that one will do the work.

A committee of Liverpool citizens has been formed to make preparations for the 1923 meeting of the British Association which will be held in that city. The council of the Association has decided to nominate Sir Ernest Rutherford as president for 1923.

"Igranic" Theatre Dimmers.

Igranic theatre dimmers have been used ever since electricity was first employed for stage lighting. Stage electricians will remember the large and heavy "Igranic" dimmers first used for electrically illuminated stage effects. Subsequent developments, however, resulted in the production of a circular plate dimmer, known as the "Igranic" Simplicity dimmer. With this type of dimmer it was possible to secure much better and more convenient control, and the present day "Igranic" dimmers are of the same type, with various improvements. One installation of the old type, however, has not only been continuously in service since 1900, but on one occasion was submerged entirely by a flood.

The latest design of dimmer plate has a great many more contact segments, so that the resistance of the plate can be cut in or out of



A Recent Theatre Installation.

the lamp circuit in smaller quantities, thus allowing much smoother and more gradual variations and graduations in the lamp brilliancy. Instead of having resistance on one side of the plate only, as in the earlier type, the new plates can be provided, where necessary, with a resistance on each side of the base. This really makes one plate equal to two of the earlier type. Each side can be used as a dimmer for a separate group of carbon filament or tungsten lamps. Or one of these plates may be used as a complete two-wire or a complete three-wire dimmer.

The contact buttons are of punched copper and ground smooth, so that there is very little friction between them and the contact lever. Operation is consequently very easy. The terminals are of brass, mounted on the circumference of the plate, and are easily accessible. The wires connecting the terminals to the resistance are arranged in grooves in the soapstone base under the malleable iron frame. The contact lever is bolted to an insulating disc, which in turn is mounted on the shaft carrying the operating pinions. All current carrying parts are therefore perfectly insulated from operating levers, shafts, rack rods, pinions, iron base frame, and the frame work in which the plates are assembled.

The terminals for making the connections are accessibly located, and the well-known rack and pinion drive, first employed on "Igranic" dimmers, is used for moving the brushes over the contact segments. The length of the operating levers makes it possible to obtain very gradual movement, eliminating jerky motions and consequent poor dimming effects.

Osram Axial Type Lamps.

The Osram axial type lamp is specially designed for use where a concentrated downward light is required. The filament is mounted at right angles to the axis, and the light is therefore thrown downward instead of horizontally.

This downward illumination is increased by the use of an opal reflector, which fits closely to the upper half of the bulb, and is held in position by a brass ring. With the opal reflector, a 30 W Osram axial type lamp gives a maximum of nearly 50 c.p. at angles up to 30 deg. from the vertical. Lamps of 30 and 60 W are obtainable in all standard voltage ranges between 100 and 250 V.

The General Electric Company have just issued an illustrated leaflet, No. O.S. 2544, in which these lamps are fully described and priced.

All-Electric Houses at Glasgow.

Mr. R. Hardie, of the Glasgow Electricity Department, sends us some details of the "all-electric" houses at Riddrie which were open for public inspection between Feb. 15 and March 8. During that period the houses were visited by 28 000 people, the average daily attendance being 1 470. The lowest attendance on any one day was 366, when a heavy snowstorm took place, and the highest 2 316.

Riddrie is situated in the north-east of Glasgow about 3 miles from the centre of the city, and the only public advertisement of the exhibition was an announcement which was placed on all the tramcars.

General Details.

Fig. 1 affords some idea of the interest created in these houses, and, in fact, it was found physically impossible to deal satisfactorily with the large numbers on a few of the busiest days, especially as something more was desired than merely allowing the people to pass through the houses. Endeavours were made to give sufficient time for the visitors to become interested not only in the general get-up of the houses, but in their special features, such as the absence of fireplaces in the bedrooms, the advantages of electric fires, &c. The kitchenette or scullery, containing the electric cooker, clothes and dish washing machine, electric hot water circulator, ironing table and electric iron, was perhaps the most attractive apartment in the house, the dish washer somewhat naturally making a special appeal to the ladies. This kitchen is illustrated in Fig. 2.

Installation Features.

It may be mentioned that the two houses on view were semi-detached, each containing five apartments and including on the ground floor a living room, parlour, commodious scullery, larder, pram house, and on the upper floor three bedrooms and a bathroom. The houses were not especially designed as "all-electric" houses, but were similar to those now being erected at Riddrie with the exception that the fireplaces and the necessary flues and chimney-heads were omitted from the parlours and bedrooms, but were retained in the living rooms. One of the houses had a complete installation for lighting, cooking, heating, hot water supply and washing by electricity. The other house was similar, with the exception that a coal fire was provided in the living room with a copper boiler behind it which was connected to a copper hot water tank in the scullery for providing a hot water supply. In the case of the "all electric house," the hot water supply was given from a calorifier set, comprising a 20-gallon copper storage tank and a 3 kW circulator..

In the second house, an open fire was fitted to heat the living room and provide hot water. Smokeless fuel was used in this open fire, and unlike some smokeless fuels of former days, this was literally smokeless, and confirmed the claim that if all houses were equipped

Fig. 1.—Queues Waiting Admission to House.

after the fashion of either of the Riddrie houses Glasgow would be a cleaner and healthier place in which to live, and the perpetual smoke pall which overhangs Glasgow, like most large cities, would be a thing of the past.

The Omission of Fireplaces.

The omission of fireplaces was one of the features that received favourable comment from the visitors. Convention dies hard, but it was demonstrated, Mr. Hardie thinks, beyond argument that the provision of fireplaces with grates, flues and chimney-heads is an unnecessary expenditure, quite uncalled for in a modern dwelling. The argument that the coal or gas-fire flues are indispensable for ventilation or changing the air of the room received its quietus. The rooms were ventilated satisfactorily by means of small openings in upper part of walls.

The lighting fixtures throughout were of the latest type, and in addition a choice selection of floor and table standard lamps were on view.

Justified by Results.

Proof of the wide interest created is evidenced by the large numbers who travelled from all parts of the city, often in inclement weather, and departed obviously delighted with their visit.

As to permanent results, the department is justified in considering the Electric House Exhibit one of the best propaganda efforts made by them, and certainly the cheapest. The department set

Fig. 2.—Scullery showing Washing Machine, Wash Boiler, Cooker, &c.

out to prove the claim previously made by them, that a modern electric house, although worth infinitely more, costs no more to build than the average house with its coal fires and other relics of former days. They are satisfied that the majority of the visitors left with the conviction that an electric house is the ideal, their only obstacle being the difficulty of securing one, Many of the visitors regretted the fact that they did not at present enjoy electric service, but the department are content in the knowledge that they have in many cases induced dissatisfaction with their present environment, a very necessary first step to reform.

Women nowadays are desirous of reducing housework to a minimum, and to this end electricity has no rival. The electric house idea will in all probability extend. When one reads of the experience of American towns where in one year eighty electric homes in as many cities were built, equipped electrically and opened for public inspection and visited by close on 1,000,000 visitors, Mr. Hardie points out that many within the electrical industry do not even now appreciate the magnitude of this achievement.

Houses v. Showrooms.

As a result of close personal observation of the Glasgow experiment, Mr. Hardie is of opinion that such an exhibit is bound to be productive of a growing desire for electric service in many homes. No matter how well laid-out the showroom may be, no matter how seductively the various pieces of electrical apparatus may be displayed therein, nothing can compare for direct appeal with the electric home exhibit, in which all the appliances are shown in actual working operation, each in its proper place.

As is fitting, both houses are now being rented by members of the Glasgow Corporation Electricity Department Staff, and careful comparative records will be taken to ascertain actual running costs of all apparatus. The houses will also be open at any time for interested visitors.

L. G. Hawkins & Company have issued a descriptive leaflet of their new Vio Ray high-frequency outfits. This describes the "Baby" model, which is supplied complete with one surface electrode, and is specially manufactured for use in the home. Various other applicators are available for such complaints as pyorrhœa, catarrh, throat troubles, nervous disorders, &c.

Correspondence.

"A BRIGHTER INSTITUTION."

To the Editor of THE ELECTRICIAN.

SIR,—I wish, as a result of my recent experience, to endorse in general the remarks you make. I suggested, when I knew that three subjects were to be taken in one evening, that my Paper be taken as read, but was told by the secretary that was not allowed, and I was forced to attempt in ten minutes a hurried and breathless survey.

I would like to correct the report of my reply. I think I said, and I intended to say, that starting conditions were infinite (not indefinite as reported), and to attempt to set up standard rules to meet infinite conditions was ridiculous. That is why any rules drawn up by the B.E.S.A. will be ignored in practice unless they confine themselves to a statement regarding temperature rises for various classes of material and a statement regarding the information to be given the starter maker.—I am, etc., J. ANDERSON.

Birmingham, March 25.

THE INSTITUTION BUILDING.

To the Editor of THE ELECTRICIAN.

SIR,—Immediately following the Faraday Celebrations you inserted my letter calling attention to the bad illumination of the lecture hall.

Since then the member of Council who, together with our immediate past-President, was responsible for the alterations announced at an ordinary meeting of members, has informed me that at the Faraday Celebrations the top lights were not turned on, and showed me the details of the altered illumination which was used at last Thursday's meeting.

It is good to know the council were not satisfied with the illumination when we returned "home," but it is to be regretted that the altered lighting cannot be called a real improvement or form an object lesson in good practice. The cove lighting, above the Council table, has been abolished and the illumination of the side coves tapered from zero to maximum in the 10 or 15 ft. adjoining it. The back cove is fully illuminated. To compensate for the resultant lack of light around the President, four high candle-power half-watt (inert gasfilled) lamps have been fixed above the glass ceiling so that the President is fully aware of "the fierce light that beats upon a throne," for he suffers from glare both from the opposite cove and especially from the direct rays of the ceiling-hid lamps. The improvement is a shuffle and not radical.

The illumination in other parts of our home is apparently having attention, for newly erected milk glass hemispheres of an obsolete and inefficient type are being tried in one room apparently regardless of the fact that this form of semi-indirect illumination is already dying out.

As destructive criticism should always be supported by constructive suggestions, I am sending to the council a scheme that will be an improvement on what we have at present in our lecture hall, and the object of this letter is to get others who have the interests of correct illumination at heart to do the same so that the whole question can be reconsidered and a model up-to-date illumination be obtained.—I am, &c., JUSTUS ECK.

Chiswick, March 25.

RENTAL WIRING AT EASTBOURNE.

To the Editor of THE ELECTRICIAN.

Sir,—The editorial notes on the rental wiring at Eastbourne appearing in your issue of March 10th have interested me considerably, but I note that the figures which you quote as the cost for wiring these houses are based on some preliminary estimates and not on the actual figure for which the wiring contracts have been let. The cost of £9 per house for wiring a group of six-light houses with the simplest possible fittings is clearly on the high side, even allowing for the contractors' profit and an overhead charge by the Corporation. The actual price, however, at which the successful contractors, Messrs. A. C. Burton & Sons, have quoted for the work was 18s. per point, including a pendent, opal shade and lamp and ironclad D.P. combined switch and fuses for each house into which the Corporation will lead direct.

This extremely low price is partly accounted for by the fact that the Ediswan wiring system will be employed.—I am, &c.,

F. CHARLES RAPHAEL,
Manager, Cable and Wire Department,
Edison Swan Electric Co., Ltd.

Ponders End, March 22.

MECHANICAL AND ELECTRICAL EFFECTS OF LARGE CURRENTS ON H.-T. SWITCHGEAR.

To the Editor of THE ELECTRICIAN.

SIR,—While we have no desire to carry on a lengthy discussion in your columns, there are one or two points on which we feel comment on Dr. Garrard's letter of the 20th inst. is desirable.

We cannot agree that the wooden operating rod is a type now abandoned in face of the fact that it is used in the apparatus built by both the Westinghouse Electric & Manufacturing Company and the General Electric Company in America, certain Continental Companies, and to some extent by ourselves. The prejudice which exists in some quarters is entirely due to experience with wood rods which have been improperly treated. It seems hardly fair to imply that the practice is obsolete in face of the above examples to the contrary.

In regard to the type of contacts this is entirely a matter of opinion, since each type has its advantages and disadvantages. The space question is so often the determining factor that the brush type of switch appears to be increasingly popular, especially for the heavier currents. It is certainly not possible entirely to eliminate either the brush or the controller fingers when considering the wide range of designs now demanded.

In conclusion, we would like to state that contacts similar to Dr. Garrard's Fig. 3*b* have been known to freeze together. This is due to the arc between the moving wedge and the tips of the two contacts which are drawn together by reason of the current passing through the two parallel flexible paths.—We are, &c.,

METROPOLITAN-VICKERS ELECTRICAL COMPANY, LTD.

Trafford Park, March 27.

Institution Business.

The business at the special general meetings of the INSTITUTION OF ELECTRICAL ENGINEERS on Thursday, March 23, was performed fairly quickly before a meagre audience.

Financial Matters.

The first of these special general meetings was called to pass a resolution authorising a formal transfer of the debt of the old Institution to the new chartered body. This was passed without either remark or dissention.

The By-Laws.

The second general meeting, which immediately followed, was called to consider and, if thought fit, to pass draft by-laws. It was opened by the PRESIDENT formally moving the adoption of the by-laws as submitted. In doing so, Mr. Highfield referred to the excellent work of Mr. Atkinson and Sir James Devonshire in securing the Royal charter and exhibited copies of the Institution's new seal.

The Proposed Changes.

Mr. LLEWELYN B. ATKINSON, in seconding the adoption of the draft by-laws, gave a detailed account of the proposed changes and their probable effects. In dealing with by-law 9, which sets out the initials that may be used by the different classes of members, he remarked that it had been hoped to bring in the words "chartered electrical engineer," but the Privy Council were averse to this, and it appeared that the historic case of the term "chartered accountant" being permitted was a mistake, as it was the members as an institution which received the charter and not the members individually. With regard to by-law 41, which deals with the expulsion of members, Mr. Atkinson pointed out the great difficulties of the whole question. If the general body of members were the deciding authority in matters of this kind, as had been the case, it was obvious in equity that a detailed statement would have to be issued to each member, a course which presented obvious difficulties. While as the most crowded meeting could only represent a small proportion of the membership it might be easy more or less to pack the gathering on the behalf of the member concerned. If the Council used proxies to carry their resolution, as they were perfectly entitled to do, they might be accused of prejudicing the defendant's case. The Council, in such matters, were really a court and not the prosecutors, and under the new by-law there would still be an appeal from them to a special body of three past-presidents. In detailing the new policy for the nomination and election of the Council, he mentioned that the nomination of associate members need not be done by associate members alone, but by members and associate members together, so long as the nomination paper was not signed by more than ten people.

The Expulsion Dilemma.

Dr. S. P. SMITH commented adversely on the proposed alterations in the by-laws with regard to expulsion. He was afraid that by the procedure suggested the Council might place itself in an invidious position. For, subsequent to their decision, the offending member might obtain sufficient support to call a special protest meeting or a feeling might arise that injustice had been done so that ultimately a vote of no confidence in the Council might be passed. Even if an offending member could obtain sufficient support at a general meeting to keep him in the Institution he (Dr. Smith) thought that would be the less of the two evils.

Mr. C. LE MAISTRE, however, supported the Council's proposal on the grounds that in such cases there were often reasons for expulsion which it would be impossible to give at a general meeting. This line was also taken by Mr. P. M. BAKER, who said that the

procedure followed by various medical associations was very similar to that now suggested by the Council.

Election Difficulties.

Mr. F. C. Raphael also endorsed the remarks of Mr. Le Maistre and Mr. Baker. He, however, objected to the retrograde step which the Council proposed to take on the election question. During Dr. Ferranti's presidency it had been proposed that members should send in nominations from which the Council could fill the vacancies. There was an outcry against this because as a result the existing rule had been adopted. The Council could not be expected to place its finger on every likely candidate, and he was afraid that unless there was a distinct statement that outside nominations would not only be tolerated but welcomed, the Council's nominations would be regarded more or less as having the force of election and no one would care to put up any opposition.

The Official View.

The President, in replying to the criticisms, said that the question of expulsion was a most delicate one, but it was better for the person expelled that there should be no publicity.

Mr. Atkinson said that the nomination of suitable members for the Council by those outside the Council was certainly welcomed. It was one of the ways in which the new and unsuspected merit might be found, particularly from the territorial centres.

The resolution was then put and carried unanimously.

Electricity Supply to a Garden City.

A little disturbance was caused in these columns some time ago by criticisms of the supineness of the Welwyn Garden City and the North Metropolitan Electric Power Supply Company in providing a supply of electricity for the inhabitants of Welwyn. This difficulty has for some time now been overcome by the supply of energy from the North Metropolitan station at Hertford to a special and very handsome sub-station on the land of the Welwyn Garden City through a 20 000 V cable. The cabling, which was carried out by the British Insulated & Helsby Cables, Ltd., consisted of the laying and jointing 6½ miles of 0·05 sq. in. three-core

Fig. 1.—A Typical Joint.

single-wire armoured 20 000 V cable and the same length of combined screened pilot and telephone cable, both laid in the same trench. The feeder so formed is protected by means of the Merz-Beard protective system. The cable, besides supplying the Garden City, forms part of an inter-connector between Hertford and the North Metropolitan Company's generating station at St. Albans. Both cables were laid direct in the ground with a protective covering of creosoted boards. The normal depth of trench gave 24 in. of cover throughout. One mile of the route lies alongside the Great Northern Railway Company's branch line to Hertford, and includes three river crossings, for which special girders had to be provided. The remainder of the route follows the Hertford-Welwyn road and hence across arable land to the sub-station.

The whole work took nine weeks exactly to carry out, the average number of men in all gangs employed amounting to sixty and the maximum to seventy-nine.

Vernier copper braid and Vernier patent baffle plates were

Fig. 2.—Laying the Hertford-Welwyn Cable.

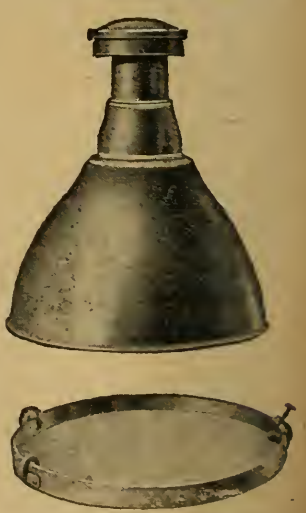
used for jointing, the joints being protected by creosoted boxes with sheet iron tops. The cable was tested for fifteen minutes by means of a Delon unidirectional testing set, with 80 000 V between the cores and 60 000 V between cores and earth.

B.T.-H. "Trutint" Colour-Matching Unit.

The "Trutint," Unit, recently produced by the British Thomson-Houston Company, consists of a Mazdalux reflector fitted with a special daylight glass screen, and equipped with a Mazda gasfilled lamp. This screen, by absorbing most of the red and yellow rays, produces an illumination which, to all intents and purposes, is identical with daylight from a north sky.

The success of the "Trutint" Unit depends of course upon the composition and colour of the glass screen. The development and production of this glass have involved a large amount of research and experiment spread over a long period. The actual apparatus is simple enough—so simple, indeed, that many people might think it possible to achieve the same results by filtering the light through an ordinary piece of blue-tinted glass. Although artificial light modified in this way might have the appearance of daylight, the colour test would immediately expose its inaccuracy.

The British Thomson-Houston Company have fitted up demonstration cabinets to prove this point. Each cabinet consists of several compartments, one compartment being lighted by a bare carbon lamp, another by a bare metal filament lamp, a third by a gasfilled lamp in a reflector fitted with ordinary blue glass, and a fourth by a Mazda gasfilled lamp in a "Trutint" unit. Ribbons of various colours are stretched along the floor of the cabinet, and one may see at a glance how the colours are affected by the different forms of lighting equipment. The variations are startling, and there is a very perceptible difference between the effects produced respectively by the "Trutint" unit and the ordinary blue glass.



B.T.-H. "Trutint" Unit for pendent use, showing special daylight glass screen detached from reflector.

"Trutint" units are made in two forms. One consists simply of the reflector and screen, which is contained in a metal ring secured by thumbscrews to the reflector. This form is for pendent use in industrial and commercial establishments, and it is supplied in three sizes, for 100W, 200W and 500W Mazda gasfilled lamps. The other unit is only made in one size—for a 100W lamp, and consists of the reflector and screen fitted to a standard equipped with a switch in the base, the entire unit being finished in antique copper. This standard type of "Trutint" is intended for use on counters, desks, &c., where it is desired to have local daylight illumination without interfering with the general lighting scheme.

One of the most interesting of the many "Trutint" installations that have been carried out was the temporary equipment of sixty large "Trutint" Units employed to light the Royal Gardens at the Ideal Home Exhibition, referred to in our issue of March 10

Showroom Displays and Demonstrations.

The fifth and last of the Salesmanship Conferences to be held this season by the E.D.A. took place recently, when Mr. A. C. Bostel, of Croydon, read a paper on "Salesmanship in Relation to Showroom Displays and Demonstrations." Mr. H. Marryat occupied the chair.

Mr. Bostel dealt with the subject from the central station engineer's point of view, and assumed a case where the authority had full powers to hire, sell and hire-purchase. Although he was firmly of the opinion that all supply undertakings, however restricted their powers might be, should have a showroom to demonstrate the uses to which electricity could be put. A large number of showrooms for the display of electrical apparatus, he said, were very poorly equipped, and even in some large stores he had found an amount of shoddy apparatus offered for sale and the assistants quite at a loss to give definite information of the cost of running them.

Window Display and Arrangement.

Dealing with window display and arrangement, Mr. Bostel said that the space inside the window of a showroom should be such as to allow one or two of each article which was of use to be shown, so arranged that everything could be seen from outside. Each article should have a card, stating what it was, its price, and the cost of running per hour or per operation. The display should be as varied as possible and not overcrowded nor mixed up with wiring accessories. He emphasised the importance of maintaining the lighting up till about eleven o'clock at night, so that the display should not be hidden from the public when the showroom was closed. A simple and inexpensive time-switch controlling a few lights in each window gave an attractive advertisement. The inside lighting of the window should be so arranged that different systems might be switched on. Outside lighting could also be demonstrated, but the outside lamps should only be switched on for demonstration purposes, as otherwise they would seriously contrast with the window display.

Showrooms should be divided up into sections, each section being devoted to a particular purpose. For example, one section to take cookery, toasters, grillers, kettles, &c.; another section showing heating apparatus, vacuum cleaners, and so on. The power section should have one or two direct-driven machines. Most manufacturers would be pleased to loan these machines, provided their representative could bring his prospective client in. It was important to have a comfortable chair for a client, because once he was in this the salesman's art was easy.

Avoidance of Too Many Makes of Apparatus.

It was a mistake to show many different makes of apparatus, and a salesman should carefully investigate the various makers' goods, thoroughly test them, and decide which was best.

Another section of the showroom should be devoted to lighting, and a darkened partitioned cupboard showing the effect of various reflectors fitted, as well as different types of fittings. Each section should be wired on a different system, giving some idea of the effect of each, and each section should have a wattmeter, calibrated in pence per hour, fixed so that the consumption of any apparatus could be given. Then, if space permitted, a hall containing 200 or 300 people should be set aside for talks and demonstrations.

Coming to the selection and management of a showroom staff, the greatest care should be exercised in this connection. He had found that girls possessing the necessary personality, appearance and address made ideal assistants.. For selling domestic appliances in a showroom they were far more efficient than men, were more eager to please, and showed unlimited patience.

The Showroom Staff.

Mr. Bostel then went into the question of keeping records. All sales and monies received should be kept distinct from the accounts for energy sold, so that an accurate record of the results of a department might be maintained. All goods bought should go into stock in the stores and be given a serial number, and each class of apparatus should have a distinguishing letter. He favoured the American system of carton packing for small accessories. Particulars of each sale should be recorded, with the name and address of the purchaser, for the benefit of the outside staff, so that, when working a road, they could see what each householder had. At Croydon he used cards arranged in roads, numerically, giving the name of each householder, the installation existing, apparatus used, &c., so that the outside staff practically knew what apparatus each householder had.

Careful Investigation of Complaints.

Dealing with the investigation of complaints, the author pointed out how necessary it was to deal carefully with each one. To satisfy a consumer was just as important as obtaining new business. They should not be afraid of showing how economies might be effected, because although revenue might be lost on that particular consumer, it came back two or three-fold in other directions.

DISCUSSION.

Mr Seaman spoke from the point of view of the ordinary contractor. It was often beyond the contractor to have a showroom of the size dealt with by the lecturer, and he suggested the stimulation of public interest by holding popular lectures on electricity and its uses, especially if accompanied by lantern slides or kinematograph displays. Something might be done by manufacturers, contractors and supply authorities, through the E.D.A., in the direction of running such public lectures during the winter in large public halls. Apparatus could be loaned, and demonstrations given. He also suggested that contractors in various districts should combine together and run a sort of permanent exhibition, supported by the supply companies in the districts. He was very much against manufacturers opening showrooms themselves, and also urged that supply authorities should supply current to contractors at a nominal rate, because the authorities would reap any reward from the sale of apparatus for which current had to be used.

Contractors' Difficulties.

Mr. Young complained of the difficulties contractors had to face through manufacturers giving discounts to the public; such a policy on the part of manufacturers was short-sighted. If the industry were to develop as it should, then the retailer must be encouraged.

Mr. Mann agreed that saleswomen should be encouraged; they were a help in dealing with their own sex. He also disagreed with wholesalers having showrooms, because if they sold to the public direct they were earning two profits.

Showrooms for Education.

Mr. W. A. Gillott pointed out how many contractors were albe thoroughly to demonstrate all classes of cooking and heating apparatus in their showrooms. In his opinion there were very few. His firm (Jackson Electric Stove Co.) had a showroom, and it was mainly used for educational purposes. If anyone came into it he was asked for the name of his contractor, and if the client paid cash for whatever he had purchased the contractor was informed that a discount had been placed to his credit. No purchasers, except those connected with the trade, were allowed discount. He was not sure that he was in favour of exhibiting the price of each article, because, in the case of a washing machine, if a client saw it priced at £50 or £60 he would not consider it. It was better to tell a customer how much a machine would cost to run. With regard to saleswomen, from the domestic point of view they were the best sellers, and there was a peculiar understanding between women in this connection.

Mr. F. W. Leevers referred to the difficulty that some contractors would not carry stocks. As to saleswomen, he would like to know whether Mr. Bostel had tried older women, because if a woman were too young she did not carry sufficient weight with a householder.

Mr. Hughman pleaded for more co-operation, especially among contractors in their own districts. He believed the day of the small man was rapidly passing.

Window Display Questions.

Mr. Bush advocated the changing of window displays frequently, and also the dealing with one kind of article at a time. It was also advisable to make a display look seasonable by concentrating on radiators, &c., in the winter, and fans in the summer. With regard to manufacturers loaning goods to contr ctors, he did not see why they should. There seemed to be an idea in the industry that manufacturers should set contractors up by lending them goods, but if that were done all over the country it would mean sinking a lot of money. Again, he maintained that if a contractor bought a thing he would exert himself more to sell it, whereas if it were merely loaned to him he would not be so keen. Contractors did not carry enough stock, and he was quite sure that in his own district the contractors had not an iron in stock between them.

Organisation of Public Lectures.

The Chairman, dealing with the organisation of public lectures, &c., to further public interest in electricity, said that the E.D.A. was considering this matter at the present time, and hoped to do more. It chiefly remained for contractors, manufacturers and supply authorities to provide the wherewithal. He also referred to the activities of the Electrical Contractors' Association with regard to the opening of showrooms. As to the recording of the names of householders and the apparatus used by them, he mentioned that in Cincinnatti an electrical firm had mapped out every house in the city, so that any man who entered the showroom could be told within a very few minutes exactly what it would cost to wire his house.

The Author's Reply.

Mr. Bostel, replying to the discussion, said it had not been his experience that inspectors, &c., were more enlightened than the salesmen and could deal with consumers better. At Croydon they had inaugurated a scheme whereby these men were given commission on any new business they might introduce, but the business obtained was very small and the information given by the men was bad. He would like to see something done to prevent manufacturers supplying goods at trade price to those not connected with the trade. He asked contractors to get it out of their heads that supply authorities wished to sell apparatus. They were really not a bit interested, but merely wanted to see people buying electricity.

Electrical Freemasonry.

Mr. J. W. Beauchamp, responding to a vote of thanks, said there was one feature in everything the E.D.A. undertook, and that was that all associations in the industry were represented. He wanted the Association to be used as a machine for goodwill in the electrical industry; it was out for what he described as a sort of electrical freemasonry.

Licences of Right have been granted to N. E. Dufty, for Patent No. 122 290 (2 549/18), for "centrifugal type of mercury cut-out for dynamo electrical machines"; and to Constructions Electriques de Belgique, Soc. Anon., for Patent No. 148 569 (20 573/20), for "an improved process for regenerating energy in d.c. electric motors."

Troughton & Young's New Showrooms.

The interest shown by the public in the exhibition of domestic electrical apparatus at Troughton and Young's new showrooms in Knightsbridge, indicates the value of such an exhibition, and we are very glad to hear that the initiative of this firm of contractors has met with success. It required a little courage and a great deal of thought to launch out on expensive premises in the West End just now when rents are very high, rates nearly as high, and profits on electrical apparatus are smaller than those on goods usually shown in the West End. But we understand that as a direct result of this exhibition, many inquiries have been received, and apparatus has been sold to chance customers in various parts of the country, and in Wales and Scotland as well as London. The firm state that their experience is that most manufacturers give fair and reasonable discount to the retailer, and that the few who do not will either have to change their ways or lose business.

Popularising Electricity in Home.

The object of the new showrooms was, of course, to popularise the use of electrical appliances in the home, and the firm took a very great deal of trouble in selecting those which they considered the best all-round articles and the most likely to suit their prospective customers. This was no easy task. Many points had to be considered, including bulk, weight, consumption, amount of labour required to keep clean, and, above all, the price.

The accompanying illustration shows some of their choice, though the Jackson stoves and A B C and Elko washers cannot be seen. The Hoover vacuum cleaner is visible in the forefront. The number of "Universal" appliances on view was a splendid testimony to their popularity. Among the other exhibits were Berry's "Magicoal" fire, Henley's wiring system, Armstrong-Whitworth lighting sets, Crompton switchboards, Tudor accumulators; and a glance at the photograph will give some idea of the variety of fittings exhibited. The hot water radiators for heating the premises are prominently shown, but the firm point out that the heating was included in the rent and they cannot spend an additional £50 a year on electricity.

Corner of Troughton & Young's Showrooms at Knightsbridge.

"Maconite." A New Insulating Material.

One of the features of the current year has been the commencement of the production, on a commercial scale for general purposes, of cable insulated with a dielectric known as "Maconite." "Maconite" dielectric, we are informed, possesses some remarkable properties which have not previously been found in combination in any one substance, and cables insulated with it have been used for some years by one of the principal railway companies in this country in long tunnels, where corrosive fumes and fluids are always present.

"Maconite" is a compound of specially selected materials scientifically blended, and is the outcome of many years' experiment and research on the part of the Macintosh Cable Company, Ltd., and their parent firm, Chas. Macintosh & Company, Ltd., Manchester. In appearance and texture the material resembles a black rubber. In toughness, according to grade, it varies from something rather stronger than ordinary vulcanised insulating rubber up to a point not far short of that possessed by the tough rubber known as C.T.S. It must not, however, be confused with these productions, in which mechanical strength is the predominant factor. Whilst the strength of "Maconite" may approach that of the rubbers referred to, its elasticity and durability is, it is claimed, much greater.

Mechanical Strength and High Insulation.

For many years attempts have been made to modify rubber compounds so as to get increased mechanical strength and elasticity without sacrifice of insulating properties. Likewise, many attempts have been made, both by the design of special coverings and modification of the structure of the rubber insulator, to obtain immunity from the attacks of acids and alkalies. From a study of the recorded causes of cable deterioration, it will be realised that the first requisite is that the cable covering, insulating or external, shall be absolutely non-hygroscopic. It is, of course, preferable that the insulating material itself should have these properties in addition to a high degree of dielectric resistance.

The difficulty of the problem is discussed at length in Mr. C. J. Beaver's classic Paper on "Cables," read before the Institution of Electrical Engineers in December, 1914.* In this paper the author states that with the vulcanised rubbers, in the present state of the art, maximum strength and elasticity are not compatible with maximum insulation resistance or dielectric strength. He states that this is especially true as regards the former, and gives quantitative illustrations, besides drawing attention to the way in which hardened vulcanised rubber is affected by immersion in water. It is well known that even the softer insulating qualities of vulcanised rubbers are hygroscopic to some degree.

Properties of "Maconite."

Now, whilst the measurable insulation of "Maconite" is lower than that of some vulcanised rubbers, this insulation resistance is constant, and is unaffected by prolonged immersion in water or in a saturated solution of caustic soda. Furthermore, its dielectric strength, *i.e.*, resistance to breakdown pressure, is high under ordinary, and many extraordinary, conditions of use, and it is becoming recognised that it is by dielectric strength and resistance to physical change over a long life that insulating materials must be judged. Its resistance to the action of a wide range of chemical reagents must appear to be remarkable to anyone familiar with ordinary rubbers.

Some details of the tests to which "Maconite" has been satisfactorily subjected will perhaps better indicate the degree of success which has been obtained. It must be understood that, except where specifically mentioned, no tests of less duration than some thousands of hours have been considered.

Extremes of Temperature.

To test its resistance to extremes of temperature "Maconite" cable was frozen in a block of ice for several days, and tested at 1 000 V a.c. for thirty minutes. It was then thawed out in running water and again tested at 1 000 V a.c. Subsequently it was boiled in water and for three hours in a weak solution of caustic soda, and exposed for several months in temperatures of 100° F. above boilers and brass furnaces. In all these cases, not only did the cable withstand the tests, but its flexibility was found to be absolutely unimpaired.

Exposure to Chemical Action.

"Maconite" was also immersed in dilute uric acid, in copper pickling acid, in a 50 per cent. solution of sulphuric acid, in a 5 per cent. solution of nitric acid, in a 50 per cent. solution of hydrochloric acid, in slaked slag water, in two samples of corrosive pit waters, in a saturated solution of caustic soda, a saturated solution of common soda, a 10 per cent. solution of ammonia, a saturated solution of common salt, and in sea water. In all these cases the cables were carrying direct current at 250 V, two cables being on test in each solution, and being connected to the positive and negative poles of the system respectively. This was done in order to be certain that the material would withstand osmotic action.

These tests, and others too numerous to mention here, serve to indicate that a most useful material has been produced.

Uses of "Maconite."

To those responsible for the installation of cables in such places as chemical works, steel works, dye works, long railway tunnels, &c., where corrosive fumes or liquids are always present, it is felt by the makers that "Maconite" will be of the greatest interest.

It is obvious that a substance such as this, in addition to forming a valuable dielectric covering for small cables to take the place of V.I.R. in bad or difficult situations, possesses great possibilities as a sheath for other classes of cables in the place of lead alloys or bitumen. It is already being used as a sheath for a surface wiring system which requires no bonding or earthing, in addition to other advantages.

Experiments are also being conducted with a view to using "Maconite" sheath on paper-insulated cables.

* See The Electrician, Vol. LXXIV., p. 186.

Flood Lighting and Holophane Reflectors.

A good deal of interest has recently been centred on the attempts that are being made with flood lighting in this country. Whilst some of the results have been fairly creditable there is much still to be done before complete success is achieved from both the architectural and artistic points of view, and especially from the point of view of uniformity.

A serious drawback to some forms of flood lighting projectors is the difficulty of varying the light distribution curve over sufficiently wide limits to ensure uniform lighting over the area to be treated. Often, if the focus is altered to improve this factor, the efficiency of the equipment suffers in consequence. In many cases, also, the flood lighting projectors have to be placed fairly close up to the building to be illuminated, with the result that the units do not possess sufficient covering power to ensure uniformity of illumination.

An installation which is worthy of notice, because these disadvantages have been overcome, is the lighting of Alders' premises at Croydon, a photograph of which we reproduce. The scheme was carried out by J. and T. Robinson, electrical contractors, of Croydon, in collaboration with the Holophane Company. The way in which the architectural features of the building are emphasised is obvious, as are the uniform results obtained over the entire surface of the stonework.

The equipment comprises six units mounted in a trough and placed on each side of the building. These units are equipped with 200 W gasfilled lamps, and Holophane reflectors mounted horizontally, the

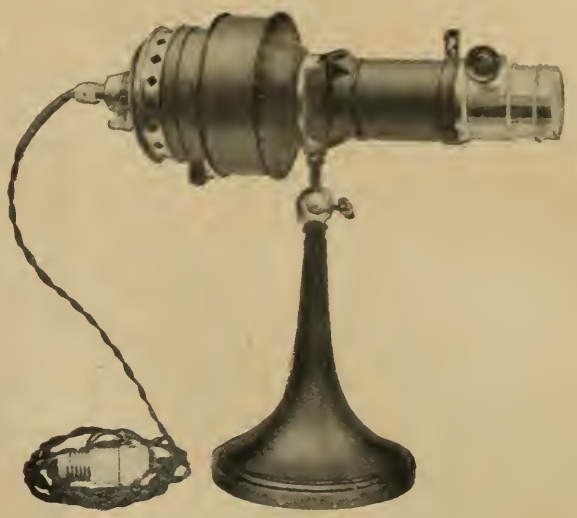
Flood Lighting applied to Shop Premises.

angles and setting being carefully calculated and adhered to, so that there is no perceptible diversity in the intensity. By changing the character of the distribution curve it is possible to reproduce similar results from greater or lesser distances (which is generally governed by circumstances), thus meeting all requirements in this direction. A further fact worthy of mention is the few points necessary to achieve such results, and the energy consumption, *i.e.*, 2·4 units per hour, represents a very economical figure for this class of spectacular lighting.

The "Practical Engineer" Electrical Pocket Book and Diary, 1922, published by the Technical Publishing Company, contains a revised section on electric traction. This matter is of such importance at the present time that it is as well that close attention should be given to it, even in pocket books, and we are glad to see that further additions are to be made next year. This is necessary, as traction to the authors of the pocket book apparently connotes tramways alone, and little space is given to the more important subject of railways and the allied problems of the electric vehicle.

The "Atrax" Projector.

The Atrax Projector is a new advertising device recently put on the market by the General Electric Company, by which a brilliantly-coloured illuminated image can be projected in any direction without the use of a screen, the image being derived from an inserted slide on the principle of the magic lantern. Hitherto the



The "Atrax" Projector.

problem of creating a sufficiently powerful light behind the lens by simple means has baffled all attempts at solution, but this difficulty has now been overcome by the introduction of a new type of Osram gasfilled electric lamp, which is rated at 100 W. The apparatus can be connected up to any convenient lamp-holder or wall-plug, and calls for no skilled attention or special technical knowledge. It is equally effective on alternating or direct current circuits, and a universal adjustment is provided so that the direction of the beam can be varied at will.

The image thrown by the Atrax Projector is so brilliant that it is visible in diffused daylight. At night, even when surrounded by other artificial lighting, it commands instant attention. The diameter of the image can be varied between 5 in. and 4 ft. approximately, but the best results are obtained by adjusting the projector to give a picture of moderate size, when the concentration of light gives great brilliance and clear definition. The possibilities of such a handy and simple device as an aid to publicity are innumerable.

Attractive Table Standard Lamps.

A standard lamp is usually a predominant feature of a room in which it is placed, and the decorative possibilities of such lamps have only recently begun to be realised. In the circumstances, the range of genuinely beautiful table standards recently placed upon the market by the British Thomson-Houston Company represents an important and welcome development.

The four standards comprised in this new range are made of metal, beautifully chased and finished in antique bronze. One of them is a reading desk lamp, and is fitted with a metal shade, key-switch lampholder, flexible cord, and a combined plug and lampholder adapter. The other three are more ornamental in design, and are equipped with shades formed of amber-glass panels fitted into a metal framework. Three pull-chain switch-holders are fitted in the largest standard, which is 22¾ in. high, and has a shade diameter of 19 in. The middle-sized standard has two pull-chain holders, and the smallest a single pull-chain holder. All three patterns (they differ in design as well as in size) are provided with bronze-coloured flexible cord to match the metal work, and a combined plug and lampholder adapter. There is a dignified charm in the contour and embellishment of the metal work, while the illumination, reflected, transmitted and subdued by the amber-glass shade, is rich and restful in its effect. For the many householders who are looking for something better and more distinctive than the usual type of domestic lighting equipment, this new line of table standards should provide a welcome relief from the polished brass-cum-silk shade convention.

We have received a useful booklet on "Electrical Installation Rules and Tables," by Mr. W. S. Ibbetson, which has been published by E. and F. N. Spon, Ltd. These tables are intended to provide a ready and convenient means of reference for architects, contractors, engineers and wiremen in the preparation of specifications and the carrying out of electrical installation of all kinds. The scope of the book is necessarily limited, and, while it does contain information which is usually found in electrical pocket books, it also contains details, such as the sizes and capacity of wood casing, which are not often found elsewhere. It is a matter for consideration on a future occasion whether it would not be as well to enlarge the format, as, though convenient in its present size, it necessarily means the use of very small type.

The "Anti-Break" Lamp Economisers.

Various spring devices have been put on the market to counteract the effect of vibration on metallic filament lamps; but, instead of lengthening the life of the lamp, they often accentuate trouble, which is not surprising when the hair-like nature of the filament, which is at white heat, is compared with the dimensions of the springs used to support the lamp-holder.

The "Anti-Break" lamp economiser, produced by the Engineering and Lighting Equipment Company, is claimed to have overcome all the difficulties in this connection. It does not depend upon springs, but consists of a number of strips of phosphor-bronze gauze, cut on the bias with the warp and weft strands disposed obliquely so that the diagonal of the mesh runs in the direction of the length of the strip. A suspension is thus provided which is inert to the transmission of vibration, as there are no wires running direct from the outer fitting to the suspended lamp through which vibration can pass; in other words, the interrupted mesh of the gauze strips destroys or damps out the waves of vibration before they reach the fragile filament. At the same time, the lamp is held rigidly in place, and even under the most severe shock the natural resilience of the disc damps the swing or rebound owing to the interwoven mesh, and so prevents the filament being destroyed.

The device possesses the further advantage that it is not affected by the heat of the lamp or atmospheric conditions. It has been tested under the most severe conditions, viz., under vibration from running machinery in engine rooms, over propellers on board ship, and under vibration set up by a pneumatic hammer on a steel plate, to which the fittings have been attached, and in no instances have the metal filament lamps been broken, although metal and carbon lamps placed under the same tests without the device have been destroyed.

West of England Firm's New Premises.

In spite of the serious difficulties of the past year, the business of Simpson, Baker & Company, electrical manufacturers and suppliers, of Bristol, has grown to such an extent that the firm have recently acquired extensive new premises in Nelson-street, where

Simpson, Baker & Company's New Premises.

they have opened a fine showroom, some idea of which can be seen from the accompanying illustration. The electrical industry in the West of England generally seems to be in a flourishing condition.

New Submarine Telephone Cable.

Telephonic communication with Northern Ireland will be considerably improved within the next few days by a new submarine cable which has been laid by the telegraph ship "Monarch." The landing places of the cable are at Port Mora, Scotland, and Port Patrick, Donaghadee, Ireland, and its length is approximately 22 nautical miles, equal to about 25½ land miles.

Tests are now being carried out on the cable, and if they are satisfactory, the land lines will be joined up at once and two additional trunk circuits provided between Glasgow and Belfast.

The laying of the cable has been greatly impeded by the bad weather during the past three months; but the "Monarch" was held in readiness to complete the work at the first favourable opportunity, and the task is now finished.

Telephone cables laid previously were of the "coil-loaded" type, but the new one is "continuous-loaded." It contains four copper wires, each weighing about 170 lb. per nautical mile. The wires are insulated by balata, weighing nearly 200 lb. per nautical mile. The four wires will provide two "physical" circuits. In addition, a "phantom" circuit will be added when required. It is anticipated that the new cable will be found suitable for the provision of further independent trunk channels in the future by the method of "high-frequency carrier-wave" telephony.

"Kingsway" Combined Switch and Plug.

For the control of radiators, motors, banks of lamps, and other appliances which necessitate the use of a temporary connection to the mains, a combined switch and plug is undoubtedly the most satisfactory apparatus.

The "Kingsway" automatic combined interlocked switch and plug (patent No. 136 006), recently introduced by the General Electric Company, is strongly made, and is capable of dealing with currents up to 15 A. The mechanism consists of a rapid rotary action double pole switch interlocked with a substantial plug.

The "Kingsway" Switch-Plug.

On the plug being inserted and turned in a clockwise direction the circuit is made, and the switch is automatically locked in the "on" position. The switching off may be carried out either by withdrawing the plug (when the switch automatically breaks the circuit before the plug pins leave the socket tubes) or by pressing the small plunger on the front of the socket cover, when the switch flies rapidly off. The latter method allows the plug to be left in the socket in the "off" position, often a great convenience.

Earthing connections on both plug and socket and a third pin for earthing are provided, the latter ensuring correct polarity, as the plug can only be inserted in one particular way. Two patterns are supplied, one for surface fixing and one for sinking flush in the wall or skirting board.

Full particulars can be obtained on application to Magnet House or at any of the provincial branches of the General Electric Company.

The Meta Electric Copper Kettle.

The Metallic Electrical Engineering Co. have placed on the market a new electrical copper kettle, which they are able to supply for either a 600 W or a 1 000 W rating and for the usual voltage ranges. It is strongly made and beautifully finished in polished copper. The capacity is 2½ pints, and the 600 W kettle boils in fifteen minutes and the 1 000 W in nine minutes. Made on mass production principles it is eminently suitable for firms who require heating and cooking appliances in large quantities.

The two years' electrical guarantee, which goes with each kettle turned out, should be sufficient evidence of the makers' confidence in

The Meta Electric Kettle.

the quality and efficiency of this line. Incidentally a two years' guarantee creates, we believe, something of a record in guarantees, most domestic electrical appliances not carrying more than a twelve months' certificate. The construction and design have been so arranged that the makers particularly recommend it for export purposes, and point out that it is unaffected by extreme climatic conditions.

The accompanying illustration gives a good impression of the kettle, the price of which is competitive.

It is expected that the plant for the electric lighting of Rawalpindi (India) will be ready to commence working in a few months. Poles to carry the overhead cables for public lighting have been erected in several roads.

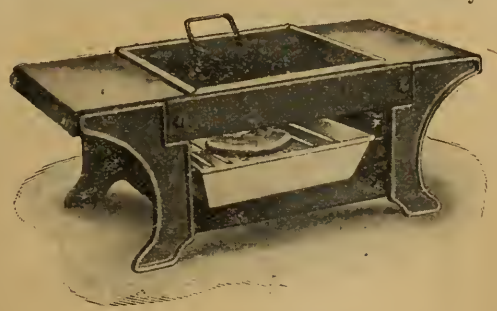
"Utility" Cooker-Radiator.

The accompanying illustrations show the "Utility" cooker-radiator, both as a radiator and as a griller or toaster. The manufacturers, ELECTRICAL UTILITIES, LTD., claim that when used as a radiator it heats a room of 2 000 cub. ft. It measures 12 in. by 6 in. by 4½ in., and weighs only 4½ lb. The cooking space is 8 in. by 6 in., and the grilling space 6 in. by 6 in. The consumption is 750 or 1 000 W, and it can be used on all voltages.

AS A RADIATOR.

The frame is of sheet steel with cast iron feet, and is fitted with polished aluminium plates on top. The small amount of metal employed ensures that the normal working temperature is quickly reached and produces the maximum amount of radiant heat. The heating coil is mounted on a set of eyeleted mica supports which are supported in mild steel channels. A movable reflector plate of polished aluminium is provided, which throws the heat outwards or upwards but which can be drawn out and placed above the element when "downward" heat is required for grilling, etc. This cooker-radiator is the forerunner of a series of heating and cooking appliances to be produced by this firm.

This cooker-radiator seems to form one of what may be called

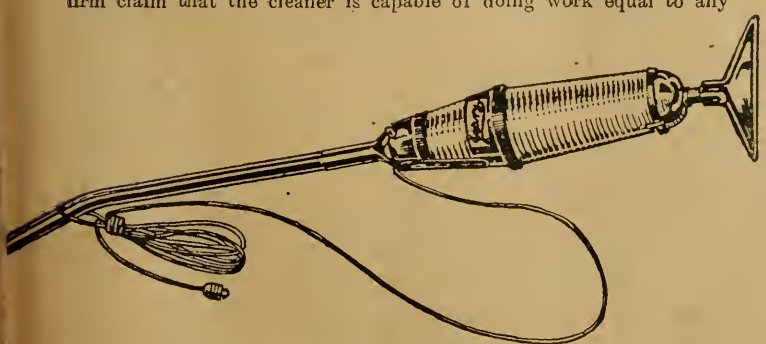


AS A COOKER

the propaganda class of apparatus, containing in one piece of equipment several features which combine to illustrate the part that may be played by electricity in the home.

New Electric Suction Cleaner.

By putting on the market an electric vacuum cleaner at ten guineas, the JEARY ELECTRICAL COMPANY are meeting a long-felt want, and there will, undoubtedly, be a great demand for this appliance. The firm claim that the cleaner is capable of doing work equal to any



THE "JEARY" ELECTRIC SUCTION SWEEPER.

machine costing double the price. It weighs only 6 lbs., and there is no exposed dust-bag to contaminate the air when the cleaner is in use. The loading is 150 W, and, as will be seen from the illustration, there are no cumbersome hose for the upholstery attachments.

Fuller's Safety Lamp.

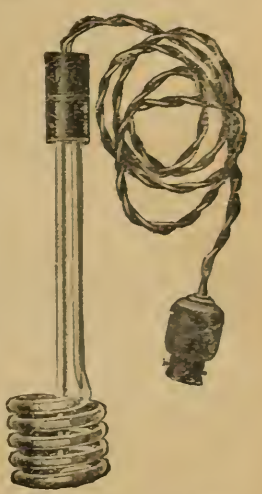
The FULLER PATENT ELECTRIC SAFETY LAMP has been in demand for many years, and the latest type embodies the practical experience of electrical and colliery engineers of repute in addition to the company's own staff. The development of the lamp has been in the direction of simplification, the number of destructible parts being reduced to a minimum and their replacement being rendered extremely simple. Its constructional design includes the best features of those Fuller lamps already in use, together with numerous improvements. The lamp has passed H.M. Home Office tests, and has been approved by that office for use in collieries and mines.

The steady brilliant light given by the Fuller lamp is an outstanding feature; the illumination it gives is claimed to be superior to that of any other lamp at present on the market.

An important structural feature of the lamp is its massive, strong construction, combined with extremely low weight (5 lbs.) and freedom from projections liable to catch in the clothing of those carrying it. The light is switched on and off by turning the top of the lamp relatively to the bottom, a perfectly smooth and positive action being obtained. The contacts have a large area, and no objectionable variation in light, due to imperfect contact, is possible. Lamps can be supplied for issuing from the lamp cabin already lighted and locked in that position, a procedure which prolongs the life of the cells by ensuring that they are maintained in a level condition by receiving uniform discharges and charges.

"Genii" Genius.

The latest electrical device to emanate from the brain of GEORGE NOBBS, LTD., is the miniature "Genii" immersion heater which we illustrate herewith. This device, which is a small edition of the large coil immersers that the firm used to produce some ten years ago, is intended as a substitute for the deadly and inconvenient gas ring in living rooms, nurseries, bedrooms, and kitchens when small quantities of water or other liquid are required to be boiled or heated up. By its employment shaving water can be heated in 30 sec. on the coldest mornings, and glasses of water, milk, or plates of soup may be prepared in the shortest possible time. No better means, it is argued, can be devised for boiling water for the early morning cup of tea, while still reclining in bed, or for the preparation of the hot water-bottle so beloved by the luxurious before retiring at night.



"THE GENII" IMMERSION HEATER.

The apparatus is fitted with an adjustable voltage connector, which allows it to be connected to any lighting circuit with a pressure between 100 and 250 V. As will be seen from the illustration, the heating coil is compact, being 2 in. in diameter by 2 in. high, so that it will go into an ordinary teacup, hot water jug or small kettle. The heater is seamless, no solder being used at all, and the radiating surface, it is claimed, is equivalent to about twice that of the ordinary electric kettle and four times that of most other makes of immersers. As regards current consumption, it is very economical, as not only is its efficiency 98 per cent., but it is only rated at 450 W. The element is in the coil portion only, and consists of nickel chrome wire for the high voltage circuit and of copper nickel wire for the low voltage circuit.

Financially the apparatus is equally desirable as its price is only 21s., and there should, therefore, be a great demand for it in the ideal home.

Universal Combination Bell.

The Universal Combination Bell, which has just been put on the market by MASON & BROWN, has been designed to provide a reliable complete electric bell at a low cost, and at the same time one that can be cheaply and quickly recharged without tools or previous experience.

The bell consists of an enamelled iron frame, with the parts fitted under the dome, which is 3 in. diameter, mounted on a polished walnut-coloured pattress, having an aperture at the back with metal contacts on the sides, to contain the battery. The aperture has a fibre cover to exclude dust. The battery is the one used for flash lamps, which for ordinary work will ring the bell a considerable time. The only fixing required is to connect the wires from push or contact to the two terminals on the bell frame.

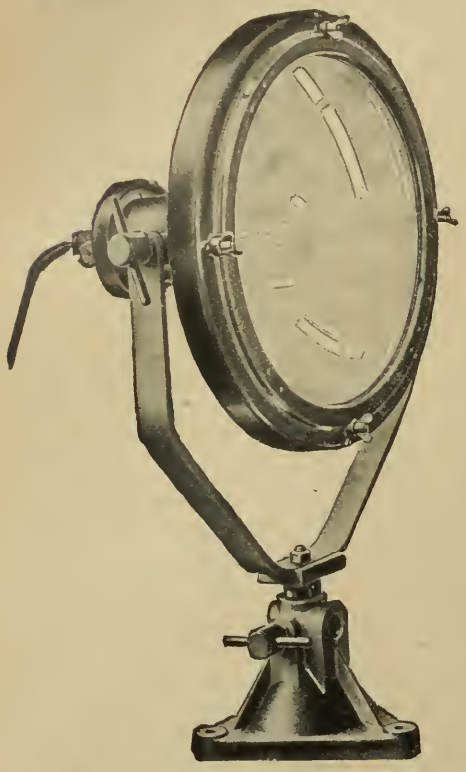
THE COMBINATION BELL.

The method of recharging is to remove the cover on the pattress, bend the two brass strips on the battery outwards. This is then slipped into the aperture, and the bell is again ready for use. The whole operation can be done under a minute without any tools. The pattress, as will be seen from the illustration, is provided with two ears for fixing on the wall, or the bell can be used for portable purposes, ringing well in any position.

The firm supply for export, if required, inert batteries, which are more suitable than ordinary flash lamp dry cells, especially for hot climates, a small quantity of water being added to the battery when required for use.

Flood-Lighting at the Maypole Works.

One of the most interesting of the many sign installations employing B.T.-H. FLOODLIGHT PROJECTORS is that recently carried out at the Maypole Margarine Works, Southall. The sign is simply a painted board—white letters on a black ground—measuring 100ft. long by 6ft. deep. It is illuminated by means of three type 793 projectors, each containing a 500 W Mazda gas filled projector lamp. These three projectors are fixed 50ft. away from the sign.

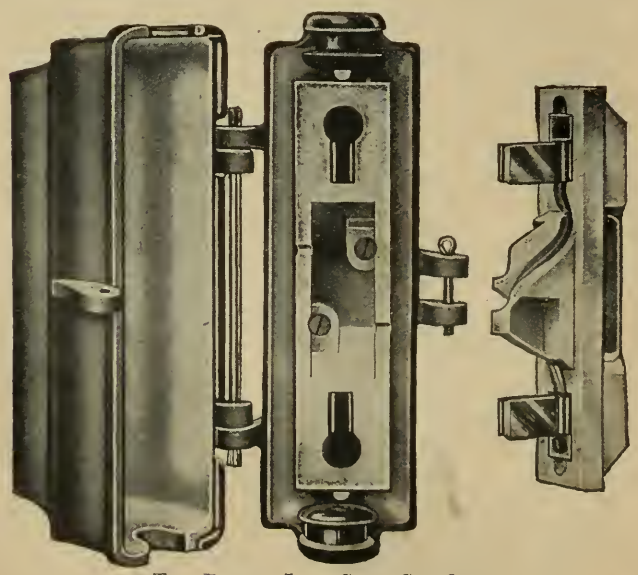


B.T.-H. FLOODLIGHT PROJECTOR.

In the ordinary way, the beam of light from a projector is circular in section. To attempt to light a sign 100ft. long by 6ft. deep with three circular beams of light would be absurd. This difficulty has been surmounted in the case of the Maypole sign by the use of special spreading glass fronts on the projectors, which give an elliptical form to the beam. An illustration, which has been reproduced from an untouched photograph, taken by the unaided light of the projector installation, shows that there is no waste, and that practically all the light is confined within the limits of the sign-board. A typical projector is shown herewith.

The "Priory" Iron-Clad Cut-Out.

We have received from the PRIORY ELECTRICAL ENGINEERING COMPANY particulars of the "Priory Iron-clad Cut-out," which embodies the following new features:—(1) The complete unit can be



THE PRIORY IRON-CLAD CUT-OUT.

mounted direct on a switchboard or wall without dismantling the porcelain interior. (2) The case can be supplied with cover to open in either direction—right or left—thus making it possible to arrange two cut-outs side by side, so that only one cover can be opened at a time. As will be seen from the illustration, the interior comprises the well-known Priory fuse.

The case is strong and neat in appearance, being finished in rich brown unchippable enamel. Three capacities are at present made, 15, 30 and 60A, and the cut-out can also be supplied in water-tight patterns if desired.

G.E.C. Cardiff Showrooms.

The accompanying illustration illustrates the main fittings showroom at the Cardiff branch of the GENERAL ELECTRIC COMPANY. These premises, which comprise offices, warehouses and showrooms, are situated in the centre of the city, entrance being

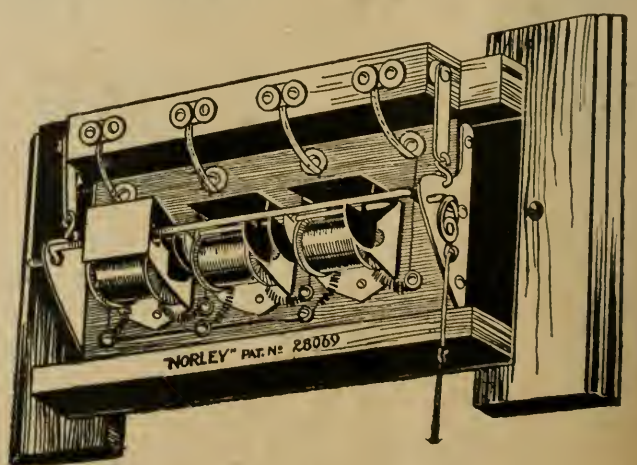
MAIN FITTINGS SHOW-ROOM AT G.E.C., CARDIFF BRANCH.

gained either from Womanby-street or from the Castle-arcade. The warehouse occupies one section of the building, and its five floors are served by a lift manufactured by the Express Lift Company. Anyone interested in electrical plant or appliances is cordially invited to visit these showrooms.

The Norley Bell Indicator.

An improved type of electric bell indicator has recently been placed on the market by NORRIS & HOLLEY. It is claimed for this apparatus that mechanical details have been cut down to a minimum, with a result that the usual troubles experienced are entirely eliminated. The illustration which we reproduce herewith shows that the indicator has one moving part, which is absolutely free from latches and springs of any kind. This moving part serves the double purpose of armature and flag, and is placed on an axis above and parallel to the bobbin of the electro-magnet, with armature members in planes at right agles to the flag member, so that when the electro-magnet is energised the attraction of the armature members tilts the flag into a position in which it can fall over the bobbin into the position of rest. The magnetic core operating this armature is completely enclosed in the bobbin, in a way which so limits the action of the field that both sides of it are equally operated on, the armature being thereby rendered extremely sensitive to electrical influence.

Owing to the arrangement of the flag the indicator is unaffected by shock or by vibration, and, as no screws or studs are used in its



THE NORLEY BELL INDICATOR.

construction, the parts are not liable to become loose and fall out. The case in which the indicators are contained is fitted with an iron back to render it damp-proof, and the movements are individually fitted to an apron which hangs vertically and clear of the base. Resetting is effected by a downward pull, which allows the indicator to be fixed out of harm's way.

Auto-Caution Signal Device.

The accompanying illustration shows the auto-caution signal device for night driving which has recently been produced by HARVEY & SPENCER, LTD., who are prepared to negotiate the manufacturing and sales rights for Great Britain, the Continent, and for British Empire territory. The device, which is simplicity itself, has received the approval of the London Safety First Council, who are of opinion that, if generally adopted, a reduction in traffic accidents at night should follow.

The device consists of a light metal casing, which can be incorporated in the back of a driving glove or attached with a flexible spring clip to the back of the hand. This casing contains a small battery, reflector, and lamp, illuminating the caution signal, and is

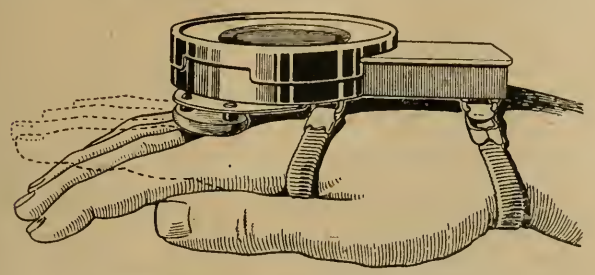


DIAGRAM OF AUTO-CAUTION SIGNAL DEVICE.

fitted with an auxiliary switch to prevent accidental discharge of the battery when the device is taken off the hand. To operate the signal it is only necessary to open the hand and extend the fingers out straight, which is the natural and intuitive method of signalling. By doing so the back of the fingers press against a switch-plate, causing the lamp to illuminate the signal word or colour.

This little device is very light and convenient, and can be supplied in different capacities, the smallest of which is not much larger in diameter than a full-size watch.

Metropolitan-Vickers Company and Contractors.

The policy of the Metropolitan-Vickers Electrical Company of opening showrooms in various parts of the country has raised the question of the attitude to be taken towards electrical contractors and others in regard to supplying the public. Speaking at an inspection of the showrooms last week, MR. P. F. CRINKS, the London manager, said he wished to make it clear that the policy of the company in opening showrooms was to help the trade. He invited electrical contractors and others to regard the company's showrooms as an extension of their own showrooms, and to send their customers there. Cards of introduction would be supplied, and the electrical contractors would get the full 25 per cent. discount off list price if sales were effected. Where the customers of electrical contractors came to the showrooms, even though they were not directly sent by the electrical contractor, the company was prepared to allow, say, half the discount off the list price to the contractor. In no case would the ordinary public be supplied at anything below list price. Electrical contractors, added Mr. Crinks, need have no fear that the company would endeavour to make sales direct to any customer whom they might send to the showrooms, and so deprive the contractor of his discount.

Telephone Committee's Report.

The REPORT OF THE SELECT COMMITTEE on the Telephone Service, of which Sir Evelyn Cecil is chairman, has been issued, and makes various recommendations for the improvement and cheapening of the telephone service. Over 100 pages of the Report are devoted to a memorandum on the visits of the chairman and Mr. W. W. Cook to Sweden, Norway and Denmark, and of Mr. Cook to the United States and Canada, to statistics of the telephone service in those countries, and to a record of the proceedings of the Committee.

Subject to approval of their conclusions, the Committee recommend "an immediate reduction of 10 per cent. on subscribers' accounts provisionally, and without prejudice to any subsequent rearrangement to carry out our recommendations."

The following is a summary of the recommendations :—

Reorganisation on more commercial lines, and separation of the telegraph and telephone departments from that of mails, and constitution of an administrative board of heads of departments under the Postmaster-General or Minister of Communications.

Division of the country into telephone areas for healthy competition and financial comparison, with local consultative committees and co-ordination as far as possible of community of interests.

Greater encouragement of co-operative enterprise where the Post Office do not see their way to develop, notably in rural areas, under Government supervision, with sanction in each case of the Railway and Canal Commission.

Telephone charges should be reduced with the reduction in the cost of living and cost of materials.

The setting aside of £200 000 annually for *extra* depreciation should be discontinued, and the charge for ordinary depreciation should be revised, which would result in a further reduction in 1922-23 of £276 000, with proportionate reductions in future years; salaries and overhead charges for new construction work, and for renewals should be debited to capital and to depreciation accounts, not to revenue, which would have meant savings on revenue account of about £400 000 and £186 000 in 1920-21. These changes represent £1 062 000 a year, or at least 8 per cent. off existing charges.

The telephone accounts should be kept in a more commercial form.

The basis of the method of charging should be the message rate. The flat rate, although theoretically objectionable, may be admitted as the means of accelerating development in very small places or for residences in certain restricted areas.

The extra mileage rate should be reduced from £10 to £5 a mile.

A certain differentiation or elasticity of rate is sometimes advisable where it assists development, and there should be a lower annual installation rental for residences than for business premises.

Judicious extension of automatic telephony; more trunk lines and less steeply-graded scale of trunk rates for the shorter distances; more latitude in standard of materials to allow of cheaper extension into rural districts.

Following on reorganisation (*a*) disappearance of the office of surveyor from the telegraph and telephone department, (*b*) transfer of the Holloway and Birmingham factories from the Department of the Controller of Stores to that of the Engineer-in-Chief, and (*c*) special care not to detail an unnecessary number of men on one piece of work or to put it through a needless multiplicity of channels.

Extension of public call-boxes. Fuller permisison to the public to employ existing Post Office telephone wires when not in use officially.

Other recommendations include the use of hand-mirco telephones for Press-reporting purposes; retention of telephones on changes of tenancy; lower charges when no night service is given: reduced charge on trunk calls on Saturday afternoons and Sundays; and prolongation of interrupted trunk calls.

Birmingham National Trades Exhibition

The accompanying illustration is a reproduction of a photograph and shows the stand which has been organized by the CITY OF BIRMINGHAM ELECTRIC SUPPLY DEPARTMENT at the National Trades Exhibition, Bingley Hall, Birmingham, to which we briefly referred in our issue last week.

A large selection of table lamps, domestic electric apparatus, accessories and fittings is on view. Among the articles exhibited are a variety of electric radiators, fires, ovens, grills, hot plates, toasters, kettles, saucepans, irons, fans, water heaters and vacuum cleaners. The exhibits also include medical violet ray apparatus, electric drills, electric blower for blacksmiths' hearths, "Fors" batteries, high tension insulators, Kaleeco cables, specimens of various grades of electric cable, and a board showing different systems of electric wiring.

The apparatus has been loaned by the British Thomson-Houston Co., Callender's Cable & Construction Co. and Metropolitan-Vickers Electrical Co.

There are several additional exhibitors of electrical apparatus at the Exhibition, including the General Electric Co., which has a representative display.

The Exhibition will remain open until the beginning of May.

BIRMINGHAM ELECTRIC SUPPLY DEPARTMENT'S STAND AT THE N.T.E.

Legal Intelligence.

Ratcliff v. Shard.

Last week Mr. Pollock, Official Referee, heard an action in which Mr. George Frederick Ratcliff, electrical engineer, sued Mr. W. J. Shard, of Bracknall, Berks, for £350, balance of charges amounting to £565, for work and labour done and materials supplied in connection with an electrical installation at defendant's house.

Defendant admitted having employed plaintiff, but pleaded that he failed to do the work properly and had charged unreasonably. Defendant also counter-claimed £20, the value of certain fittings removed from his London house and not accounted for, and £63 for money alleged to have been paid to make good and complete certain alleged defective work.

Plaintiff's case, as stated by his counsel and disclosed by his evidence, was that, having done a great deal of work for defendant extending during a period of over twenty years, he was asked in January, 1916, to carry out the installation work in respect of the present claim. The work occupied from January, 1916, to January, 1917, when, owing to the war conditions, it was difficult to obtain labour or materials, which would account for the higher charges. Defendant was one of plaintiff's best customers, and had never entered into any formal contract with him. There had never previously been any dispute, and it was left to him to do what he thought proper. The installation in the house was very old, and much of it had to be renewed. He was not told to put in an entirely new installation, which would have cost about £1 000, but to make as much use of the old as possible, and the work was made more difficult because the house was full of furniture and he had to keep the light going. He experienced great difficulty in getting materials and obtaining delivery. Some he got from the Simplex Company, and the cable he got from the Indiarubber Company. In consequence of the difficulties in getting materials, and in order to carry out the job, he had to sacrifice other customers. All the principal fittings were removed from defendant's London house.

In cross-examination, the plaintiff said that the old electric lighting was working satisfactorily, but he had to put in new work in consequence of an increase in the number of lights. According to tests he made, he did not think there was any danger of fire. He denied having told defendant that it would be a £400 job.

After the men who had done the work had given evidence, the Official Referee expressed the opinion that plaintiff's charges were excessive, and gave judgment for him for £104, and for defendant on his counter-claim for £10 for lamps taken away. He gave plaintiff costs on the High Courts scale.

Breach of Wireless Telegraph Regulations.

At the Glasgow Sheriff Court on Monday, William Harris, master of the s.s. "Clan Malcolm," was charged, at the instance of the Board of Trade, with having failed on the night of Oct. 8 last to have a wireless operator or watcher on watch, contrary to Rule 7 of the Rules made under the Merchant Shipping (Wireless Telegraphy) Act, 1919.

Defendant pleaded guilty, and his legal representative explained that just after midnight on Oct. 8 the "Clan Malcolm" ran into a fog off Corsewell Point. At once she reduced speed to slow, and two minutes after the lights of the s.s. "Rowan" were observed, and the helm was put hard aport in an endeavour to avoid collision. It was learned later that prior to the "Clan Malcolm" striking the "Rowan" the latter had been in collision with an American vessel, the "West Camak." The time of the sending out of the S.O.S. by the "Rowan" was 12.17 a.m. The collision with the "Clan Malcolm" took place at 12.19. Had the watcher been on duty on the "Clan Malcolm," the wireless room on the vessel was so situated that it would have taken him four or five minutes to get the operator to take off the message, and then it would have taken the operator seven or eight minutes to have got the messages and communicate with the bridge. It was, therefore, obvious that the failure to receive the message on the "Clan Malcolm" could have had no effect in avoiding the collision. Sheriff Fyfe imposed a fine of £25.

American Patent Litigation.

Major-General George O. Squier, of Washington (D.C.) has filed a suit in the United States District Court for the Southern District of New York against the American Telephone and Telegraph Company for infringement of his patents for "wired wireless" or "line radio." It is alleged that the American company is using the system of transmission revealed in Squier's patents Nos. 980 356, 980 357, 980 358 and 980 359 of Jan. 3, 1911. General Squier's invention applies the radio art to telegraphy and telephony over wire systems; by it the messages, instead of being "broadcasted" into space as in ordinary radio, are guided by the wire. Under the old system of telegraphy and telephony only one telephone message could be transmitted over a wire at one time, but by the use of General Squier's system many messages (telephone, telegraph, or both) can be transmitted over the same wire at the same time.

A Motor Generator Dispute.

In the King's Bench Division, Dublin, last week, Mr. Justice Pim made an order for the discovery of documents in the action brought by the Irish Kinematograph Company (1920) Ltd., against Wm. Coates & Son, Ltd., for damages for breach of a contract made in March, 1920, for the sale by defendants to plaintiffs of motor generators (with accessories), and for damages caused to plaintiffs by the defective character of the generators, for breach of warranty, and for the return of the purchase money. A sum of £500 is claimed as damages in consequence of decreased takings at plaintiff's box-office.

Parliamentary Intelligence.

South Wales Electrical Power Bill.

The South Wales Electrical Power Distribution Company's Bill came before a Select Committee of the House of Lords last week, the Earl of Kintore presiding. The Bill, among other things, seeks authority to reduce the ordinary capital of the company from £610 120 to £152 530.

Mr. Tyldesley Jones, K.C. (for the promoters), said the Bill would also enable local authorities who were authorised to supply electrical energy, and who entered into an agreement to take energy from the company, to contribute to the company's capital. The local authorities were satisfied, and the only opposition was from certain gas companies. The capital originally authorised was £1 000 000, three-quarters by shares and a quarter by borrowing. Ordinary capital of £600 000 was issued and also debentures of £200 000. From the start the company was overburdened with capital. In 1907 the company was in great difficulties, and large consumers came to the rescue and formed a company called the Treforest Electrical Consumers Company. They entered into an agreement with the Power Company and the debenture holders by which in substance the undertaking was to be carried on by the Consumers' Company for the benefit of the consumers, who agreed to find the money. The Bill would be the means of saving a large amount of money to local authorities, who would otherwise have to provide their own supply.

Mr. Clode, K.C., for eleven gas companies, said his clients took exception to the ratepayers' money being put into an alien concern over which they had no control.

The Chairman said the circumstances were unusual, and the Committee were of opinion that the Bill should proceed.

Railway Electrification Loan.

In the House of Commons last week, Mr. Hilton Young, replying to Mr. Gilbert, said the agreement between the Treasury and the Underground Electric Railways of London (for the extension and improvement of the tube railways) was not yet finally completed, and full details could not therefore yet be published. In substance, and subject to various conditions, the Treasury guaranteed principal and interest of issues of debentures to be made by the company and the City and South London Railway Compnay up to a total amount of £5 000 000. There was no question of a capital advance by the Government, which would be outside the terms of the Trade Facilities Act.

The I.M.E.A. and the Bill.

The Council of the Incorporated Municipal Electrical Association, representing undertakings that have capital involved to the extent of some £80 000 000, have sent a letter to all members of the House of Lords, containing the following resolution: "That, in the opinion of the Council of the Incorporated Municipal Electrical Association, the Electricity (Supply) Bill, 1922, should be carried into law at the earliest possible date in the interests of the industry."

Electricity Supply Bill.

The House of Lords committee stage of this Bill will be taken on Tuesday, April 4.

I.E.E. Manchester Dinner.

The annual dinner of the North-Western Centre of the Institution of Electrical Engineers was held at the Midland Hotel, Manchester, on Friday last, Alderman W. Walker being in the chair.

In responding to the toast of "The Institution of Electrical Engineers," proposed by Mr. Clare Lees, president of the Manchester Chamber of Commerce, Mr. J. S. Highfield said they were all proud of the Institution and the way it was getting in touch with the commerce of the country. The passing of the new bye-laws was now accomplished, and it was gratifying that so large a change in the history of the Institution had taken place so smoothly. The Council much appreciated the help which had been given by the local centres in preparing the new bye-laws.

The Foundation of the Industry.

Continuing, Mr. Highfield remarked that electricity supply was the foundation of the whole industry. If it flourished, the whole industry flourished, and it was interesting to see at the recent commemoration, which had made the Institution known all over the country, how speaker after speaker had referred to the hampering effect of legislation. Now the Institution had a larger voice it was their duty to see that hampering legislation should not be an obstruction to future development. In South-East Lancashire, when suggestions were made for improving the electricity supply by setting up a Gilbertian authority consisting of all sorts of people, responsible neither to the ratepayers nor to the shareholders, they had said no, and he thought they were right. Electricity to-day had a better chance than ever, not perhaps of riches, but of keeping its head above water.

The Lock Out.

Ald. W. Walker, who proposed the toast of "The Visitors," referred to the engineering lock-out. Speaking with some knowledge of both sides of the dispute, the trouble arose, he said, largely from a misunderstanding of the true facts. There was no doubt that a large number of men sincerely believed that an attempt was being made to injure the trade unions, but he could assure them that such a thing had never entered the heads of the employers.

To this toast Dr. H. F. Parshall, chairman of the Lancashire Electric Power Company, briefly replied.

Electricity Supply.

Last week CARDIFF City Council approved the recommendation to place £5 000 of the estimated profits of the electricity department to relief of rates.

The outstanding debt on the HOYLAKE electricity undertaking is only £28 000, and when this has been paid off the profits will be available for rate reduction.

The new 12 000/15 000 kW turbo-generator at BRADFORD Electricity Works was formally opened last week by Mr. J. W. Longley, deputy-chairman of the Electricity Committee.

Mr. ARTHUR ELLIS, of Arthur Ellis & Partners, consulting engineers, Cardiff, has been appointed by the HULL Corporation Electricity Committee to report upon the efficiency of their undertaking from a technical and commercial point of view.

MILNROW URBAN COUNCIL have applied for a Special Order to authorise the Council to generate and distribute electrical energy in Milnrow. Any objections should be sent to the Secretary, Electricity Commission, Gwydyr House, Whitehall, S.W. 1, by April 8.

TYNEMOUTH Electricity Department shows a surplus on the past year's working of £2 895, against a loss of £293 in the previous year. The number of units sold has increased by 1 700 000. The average charge for electricity for all purposes is 1.62d. per unit sold.

NEWTON ABBOT Urban Council have applied to the Minister of Transport for a further extension, until July 31, 1923, of the time within which they may give notice to the Urban Electric Supply Company of intention to exercise their right to acquire the company's undertaking in the district. Any objections must be sent to the Ministry of Transport by April 17.

LIVERPOOL Corporation have applied for a Special Order to extend their area of electricity supply so as to include the Borough of Bootle and the Urban Districts of Litherland, Waterloo-with-Seaforth, and Great Crosby; to acquire the electricity undertakings of Bootle Corporation and the Liverpool District Lighting Company, &c. Objections must be sent to the Secretary, Electricity Commission. Gwydyr House, Whitehall, S.W. 1, by April 22.

New Schemes and Mains Extensions.

ST. MARYLEBONE Borough Council has received sanction to borrow £15 000 for mains and services.

ASHFORD (Kent) Urban Council has decided to apply for a Provisional Order for electric lighting.

ORMSKIRK Electric Supply Company have extended their cable to Greetby Hill, a point near the Lathom boundary.

READING Electric Light Company have been asked by Twyford Parish Council to extend their mains to that district.

GRAYS Urban Council has applied to the Electricity Commissioners for sanction to a loan of £3 500 for additional generating plant.

BRAILES Rural Council has granted permission for the erection of overhead wires for the supply of electricity to the parish church at Pillerton Hersey.

In connection with the proposed electric supply scheme for AXMINSTER, Johnson & Phillips have informed the Urban Council that the cost of the plant and mains would be £5 000. The Council have decided to offer no opposition to the scheme.

BRISTOL Electricity Committee have decided to apply for sanction to a loan of £4 275. Owing to the number of house connections being 50 per cent. greater than estimated, the sum of £36 000 sanctioned in 1920 will be exhausted next month. It is calculated that the new loan would meet requirements to March, 1925.

PRESTON Town Council have approved of application being made for sanction to borrow £305 000 for the purchase of the undertaking of the National Electric Supply Company, Preston, in pursuance of the agreement already made, and authorising a scheme for the Mid-Lancashire district, to be prepared jointly by the Blackburn and Preston Corporations.

THE CANNOCK CHASE COLLIERY COMPANY are offering facilities to the residents of Chasetown and Brownhills by which they may be supplied with current. Last week demonstrations of electric lighting were given, and different types of wiring, lamps and fittings were exhibited and explained, and the various uses to which electricity could be put were demonstrated. Mr. Sopwith (general manager of the Cannock Chase Colliery Company, Ltd.) said that at the recent electricity enquiry at Wolverhampton the Commissioners were surprised and pleased to find there was such a big electricity plant on Cannock Chase. He thought that if anything from 100 to 200 consumers were secured that the local council would be justified in adopting electricity for public lighting.

Alteration of Charges.

BATH Electricity Department has decided to reduce the price of electricity to private consumers from 9d. to 8d. per unit.

SEVENOAKS and District Electricity Co. has introduced a new two-part domestic tariff as an alternative to the flat rate, namely, a fixed annual charge, payable in quarterly instalments, plus 2½d. per unit.

PORTSMOUTH Council have decided to supply cinema theatres with electricity for their lanterns at half the cost specified in the tariff for lighting purposes, the charge to vary in accordance with the scale.

DUBLIN Corporation has adopted recommendations of its Electricity Committee by which it is hoped the charge for electricity may be reduced by 10 per cent., and by 20 per cent. for exceptional lighting and power consumers.

Users of electricity at STREATHAM, tradesmen in particular, are complaining that there has been no reduction since the war in the price of electricity, and the matter is being taken up by the local Chamber of Commerce.

HOYLAKE Town Council have decided to reduce the price of electricity for lighting from 9d. to 8d. as from the end of this month. The price for heating and cooking will remain unaltered, namely, 4d., but for power the rate will be slightly reduced on a sliding scale.

The following reduced scale of charges for electricity has been adopted by BEDFORD Town Council :—Lighting, flat rate, from 9½d. to 8½d., less ½d. per unit discount; two-rate systems, 8½d. and 6½d., less 1½d. discount; pre-payment meters, 10d., less 1½d. discount; all lighting accounts to be subject to a minimum charge of 5s. per quarter. The charge for heating has been reduced from 1½d. per unit net to 1½d. for the first 250 units per quarter, 1¼d. for the next 500, and 1d. beyond. For power the maximum price is now 2½d., less 5 per cent., and cinematographs and photographers will be allowed ½d. per unit off the price figure.

Electric Traction.

READING Corporation Tramway receipts from April 1, 1921, to Feb. 2, 1922, amounted to £69 431, compared with £73 187 for the corresponding period of 1920-21.

A NEW TYPE OF TRAMCAR, having overhead trolley arms in addition to the underground connection, is being run by the London County Council on the Clapham, Balham and Tooting route.

After a heated discussion, HULL City Council last week adopted the minutes of the Finance Committee, in which it was recommended that £10 000 from the tramways profits should go towards the relief of the rates.

NEWCASTLE TRANSPORT & ELECTRICITY COMMITTEE, which has been considering taking over the Gateshead and District Tramways with a view to the through running of the cars between the city and Gateshead, has decided against the purchase.

The strike of employees at the NEWCASTLE-ON-TYNE Tramway Department is now completely ended. The remaining 240 strikers—skilled and semi-skilled men employed in the maintenance department—returned to work on Monday, but not until their places were being rapidly filled from the ranks of the unemployed did they accept the 47-hour week.

At their meeting last week CHESTER Town Council decided that the tramways should be maintained as at present laid out for a period of seven or eight years, when the full life of the track would have been obtained, and that the recommendation set out in Mr. Fearnley's report be carried out, and that the surveyor be authorised to proceed with the work at a cost of £12 000.

A fresh agreement has been entered into by the London County Council and the Metropolitan Electric Tramways, Ltd., for the THROUGH RUNNING OF TRAMCARS. All short-running cars turning at Finsbury Park have been withdrawn and through services substituted. The company will pay to the Council 10·5d. a car mile in respect of the car mileage run by the Council in excess of its proportion under the existing through running arrangements. The arrangement will remain in force for six months and be terminable on Sept. 29, 1922, on one month's notice on either side, or thereafter on three months' notice on either side.

The strike of the SUNDERLAND AND DISTRICT TRAMWAY COMPANY, which started on Feb. 22, is still no nearer settlement. A conference, which was called last week at the instance of the Industrial Relations Department of the Ministry of Labour, between the managers of the company and the men's representatives, broke down. Alternative terms were offered by the manager, Mr. J. Stratton, to the men's representatives, and a meeting was immediately called, and the terms submitted. On a vote being taken, the men refused to accept them by a large majority. The conference broke up without any arrangements being made to continue negotiations.

The LONDON & NORTH-WESTERN RAILWAY are conducting trials on a turbo-electric locomotive constructed by Armstrong, Whitworth & Company for the Ramsay Condensing Locomotive Company. The engine, the "Times" states, has a length overall of 69 ft. 7 in., and weighs 130¾ tons, including coal and water. The front part contains the boiler (which generates steam at 200 lb. pressure and 300° F. superheat), the main three-phase turbo-alternator, and the auxiliary exciting turbo-generator. The current is taken to four 275 H.P. electric motors, two of which drive the wheels of the front part and two those of the back part or tender. In both cases there are six coupled wheels. The exhaust steam is conducted to the tender, where it is condensed in a condenser of special construction. The hot condensed water returns to the hot well and thence to the boiler. The object sought by the designer, Mr. D. M. Ramsay, is economy of coal and water.

The Industrial Welfare Society is now arranging the second of a series of annual conferences, to be held in the society's offices at 51, Palace-street, Westminster, on Friday April 28, to discuss the ESSENTIALS FOR SUCCESS IN WORKS AND STAFF JOURNALS. It is estimated that more than 200 firms now publish such magazines.

Personal and Appointments.

Prof. K. Vickers has been appointed principal of the University College, Southampton.

Mr. Hurst has been appointed engineer, manager and secretary of the Teignmouth Electric Lighting Company.

Mr. R. S. Johnson has been appointed managing director of Cammell, Laird & Company's works at Birkenhead.

Mr. J. A. Forde, engineer and manager of the Isle of Thanet Electric Tramways & Lighting Company, Ltd., has been appointed a Justice of the Peace for the Cinque Ports Division of Kent.

Mr. C. Mitchell has resigned his position as works manager of the Marconi Wireless Telegraph Company at Chelmsford, and Mr. H. B. Tilley, who for nine years has been assistant works manager, has been appointed to succeed him.

Owing to the closing of the Naval Signal School at Devonport, Lieuts. Abel F. Alston, port wireless telegraphy officer, and H. Watts, visual signalling officer, have been reappointed to the "Vivid," additional, for port duties.

The King has appointed Sir Gerald Edward Chadwyck-Healey, Bart., to be a member of the Royal Commission on Awards to Inventors, to fill the vacancy caused by the resignation of Lord Rayleigh.

Mr. A. G. Marsh informs us that as from the 31st inst. he is retiring from the board of directors of the Z. Electric Lamp & Supplies Company in order to start business as a wholesale electrical supplier and manufacturers' agent. Further details will be announced later.

Business Items, &c.

Mr. Harold Parr, electrical engineer, has opened new premises at 1, Back Jane-street, off Station-square, Harrogate.

A partnership has been entered into between E. H. Phillips and Kent Brothers Electric Wire Company as from March 1, and has been registered under the title of Kent Brothers Electric Wire Company & E. H. Phillips, for the manufacture and supply of silk, cotton and enamel covered copper wires. Their London office is at 37, King-street, Covent Garden, W.C. 2.

F. W. Brackett & Company have been appointed buying agents in England for a very large and important group of mines in South America. Their clients wish to have complete catalogues of mining machinery, general engineering plant machine tools, electric motors, woodwork tools, and general stores, and interested firms are asked to send same to the company at Hythe Bridge Ironworks, Colchester, for fowarding to the mines.

Institution Notes.

Mr. S. Chadwick has been elected chairman and Mr. B. M. Burt vice-chairman of the North-Western Students' Section of the Institution of Electrical Engineers.

The March meeting of the council of the Electrical Wholesalers Federation was held in Birmingham recently at the invitation of the members of the Midland Section. Mr. A. G. Beaver (Sun Electrical Company, London) was elected president and Mr. A. Holman (Holman & Company, Glasgow) vice-president for the ensuing year, 1922-3. The members of the Federation were specially invited to the British Industries Fair at Birmingham, and were entertained at lunch by members of the executive council and the electrical exhibitors.

Educational.

The Chair of Civil and Mechanical Engineering in the University of Leeds will shortly be vacant owing to the resignation of Prof. J. Goodman, who has held the chair since 1890. Prof. Goodman proposes to give his time to research, and the University Council have assigned to him accommodation for this purpose. A committee has been appointed to recommend a successor to the post.

The Governors of the University of Nancy have arranged for a summer holiday course in electro-technics to be held from July 18 to Aug. 22, provided at least twenty students join. The fee for the course and practical work is 150 francs. Further particulars may be obtained from the hon. secretary, British Bureau, Office National des Universités, Engineering Dept., 45, Great Marlborough-street, London, W. 1.

The Wimbledon Appointment.

Mr. A. E. Mackenzie, of Messrs. C. P. Sparks & Partners, has been appointed borough electrical engineer of Wimblodon in succession to Mr. H. Tomlinson Lee, as from June 1, at a salary of £1 000 per annum. It will be remembered that Messrs. Sparks & Partners were called in as consulting engineers to report on the condition of the electricity undertaking at Wimbledon recently, and that this report was among the matters at issue in the dispute which arose between Mr. Tomlinson Lee and the Council. Before his connection with Messrs. Sparks and Partners, Mr. Mackenzie was for some time with Manchester Corporation electricity department.

Wireless Notes.

An International Wireless Telegraph Conference opened at Cannes on Tuesday under the presidency of Signor Marconi.

A Reuter's message states that in connection with the proposal to establish wireless telephone communication between Norway and England, a prominent official connected with the telegraph service stated on Saturday that, as the Government had a monopoly of the telegraph and telephone in Norway, it could not allow private companies to establish a wireless telephone service in competition with the telegraph.

It is reported from Santiago that the Chilean Navy are instituting a wireless zone in the southern territories of Chile for the assistance of merchant shipping. Wireless stations are to be erected at Castro (Chiloe), Huafo Island, Rio Aysen, Cape Raper, Puerto Bories, Evangelistas Island, Faro Felix (Felix Light), Punta Arenas (Lena Dura Inlet), and Mocha Island. Three of the above are already operating, Huafo, Raper and Bories; one, Faro Felix, is being constructed; those at Evangelistas, Porvenir, Rio Aysen, Castro, and Punta Arenas (Lena Dura) are without their installations owing to lack of necessary funds.

The agreement between the Federal Government of Australia and the Amalgamated Wireless Limited has now been signed, and provides that the Commonwealth shall subscribe £500 001, thus securing a controlling interest. The company takes over the existing Australian radio stations. Three high-power stations are to be erected within two years in Britain, Australia, and Canada, to provide direct communication, also feeder stations to connect capital cities. Rates are not to exceed per word, for full-rate messages 2s., deferred messages 1s., week-end messages 6d., Government messages 1s., Press messages 3d. The company is always to remain an independent British business, and is to give preference to goods manufactured in Australia and preference in employment to ex-soldiers.

Writing from Nairobi on Feb. 27, the "Times" correspondent states that tests in connection with the Kenya link in the Imperial wireless chain have begun with the arrival in the country of Commander Watson, R.N., and Major Ward, R.M.A. These officers have taken with them apparatus for the preliminary investigations, but will be more concerned at the outset with the physical geography of this part of Africa. They state that, in addition to the known difficulties of wireless work in the tropics, the presence of Mount Kenya and Mount Kilimanjaro and the obstructive effect of large deposits of ironstone in Uganda will cause the selected site on the Thika River to present many additional difficulties (more especially in the work of picking up messages) as compared with the other links in the chain. It is understood that it will be about two years before active operations will be possible, although it is not anticipated that the physical difficulties will be in any way insuperable.

In a letter to the "Times," Mr. A. A. Campbell Swinton states that, in addition to David Hughes' notebooks, containing an account of his experiments in wireless telegraphy in 1879, recently bequeathed to the British Museum, the Museum has even more recently acquired a further set of these notebooks, containing Hughes' own illustrated account of his invention of the microphone. Still more interesting, he states, is the fact that a search, suggested by himself to Colonel H. G. Lyons, of the Science Museum, made amongst the contents of a room full of Hughes' personal effects that for the last twenty years have been stored in a furniture repository in London, has revealed the existence of a number of electrical instruments, comprising the original first microphones invented by Hughes, and the actual apparatus with which he made his early wireless experiments, all obviously constructed with his own hands. The several instruments can easily be identified by the illustrated descriptions in the notebooks.

The collection is on view in the Western Hall of the Science Museum, South Kensington.

Telegraph and Telephone Notes.

It is reported from Copenhagen that the Jutlandic Telephone Company have accepted an offer of a loan of half a million sterling from a London financial house.

A message from Peking states that the Trans-Siberian telegraph traffic has now been opened. The regular commercial messages to Europe from Tientsin take one hour and twenty minutes.

Trade Inquiries.

An old-established Johannesburg house, specialising in mining material, desire to secure agencies for electrical machinery and electrical cables and fittings. Particulars may be obtained from the Department of Overseas Trade. Ref. No. 330.

H.M. Trade Commissioner in Winnipeg reports that a Western Canadian company desire to receive from United Kingdom manufacturers full particulars and illustrations of (*a*) electric cranes and other unloading and loading equipment for docks; (*b*) steel conveyor belting (for conveying hot clinkers), 18 in., 20 in., and 24 in. wide, thickness of metal 0·035; (*c*) H type sawmill chains and buckets. All purchases made by the firm, it is understood, are for cash. Particulars may be obtained on application to the Department of Overseas Trade.

Imperial Notes.

An electric tramway and electric supply scheme for WANGANUI (N.Z.) has been approved by the ratepayers. The Council have received sanction to a loan of £50 000 for these purposes.

The Tasmanian Division of the Council of the Institution of Engineers, Australia, have decided to submit to the Council a resolution urging support by the Institution of proposed legislation making REGISTRATION OF ELECTRICAL CONTRACTORS AND WIREMEN compulsory.

Amongst amounts recently voted by the Tasmanian Parliament were £930 000 for the TASMANIAN STATE HYDRO-ELECTRIC DEPARTMENT, and £3 000 as a first instalment of the £33 200 required for an ELECTRICALLY-PROPELLED FERRY BOAT to ply between Hobart and Bellerive.

The MELBOURNE Tramways Board has authorised the preparation of plans for the conversion of the whole of the cable lines to electric traction, and the first portion to be undertaken will be the extension of the present electric termini to the city. Statutory powers for the work will have to be first obtained.

NEWCASTLE (N.S.W.) City Council have passed a resolution that they are of opinion that the £58 000 which was placed recently on the estimates of the State Parliament towards the cost of the ELECTRIFICATION OF THE NEWCASTLE TRAMWAYS is totally inadequate. The Mayor stated that as the work would cost considerably more than a million pounds, the amount voted was too small to convince anyone that the Government were in earnest.

New Companies.

A. P. Maglen.

A. P. MAGLEN, LTD. (180 562). Private company. Reg. March 24. Capital, £100 in £1 shares. Manufacturers, importers, and distributors of electric lamps, electric light fittings, electrical appliances and apparatus, &c. Subscribers: W. R. Preston (first and permanent director) and S. H. Buckland. Registered office: Sicilian House, Southampton-row, W.C.

Automobile & Electrical Equipments.

AUTOMOBILE & ELECTRICAL EQUIPMENTS, LTD. (180 460). Private company. Registered March 21. Capital, £1 000 in £1 shares. To take over the business of suppliers and repairers of motor and electrical equipment for motor engines, cars, and craft of all kinds carried on at 1 and 2, Marylebone-passage, Wells-street, Oxford-street, W., as the Automobile Electrical Equipment Company, and to adopt an agreement with C. de Winter and R. A. Roberts. First directors: R. Herbert-Smith and R. Cooke-Jones (joint managing directors). Secretary (*pro tem.*): R. Herbert-Smith. Registered office: 1 and 2, Marylebone-passage, Wells-street, W. 1.

Butler, Spragg & Company.

BUTLER, SPRAGG, & COMPANY, LTD. (180 430). Private company. Registered March 20. Capital, £30 000 in £1 shares (10 000 7½ per cent. cumulative preference and 20 000 ordinary). To acquire the undertaking of Butler & Spragg, Ltd., and to carry on the business of mechanical, electrical, hydraulic, and general engineers, &c. First directors: A. Spragg, T. Butler, A. Harris, J. Crouch, and H. N. Whittington. Registered office: 128, Cambridge-street, Birmingham :.

Engineers (Penge) Ltd.

ENGINEERS (PENGE), LTD. (180 466). Private company. Registered March 21. Capital, £5 000 in £1 shares. Manufacturing, electrical engineers, &c. Subscribers: F. J. Pyne and E. G. Pyne. Secretary: F. H. Briggs. Registered office: 50, Croydon-road, Penge, S.E.

L. C. Engineering Supplies.

L. C. ENGINEERING SUPPLIES, LTD. (180 472). Private company. Registered March 21. Capital, £6 000 in £1 shares (3 000 preference and 3 000 ordinary). Electrical, hydraulic, mining, mechanical engineers, contractors, &c. Subscribers: L. Contamin and W. L. Watkins. Solicitors: Wansey, Stammers & Company, 52, Coleman-street, E.C.

Motolite Dynamos.

MOTOLITE DYNAMOS, LTD. (180 416). Private company. Registered March 18. Capital, £3 000 in 2 000 preference shares of £1 each and 4 000 ordinary shares of 5s. each. Dynamo manufacturers, electrical engineers, electricians, &c. First directors: L. S. Challis, H. C. Pontet and H. C. H. Smyth. Office: Landor-road Works, Landor-road, Askew-road, Shepherd's Bush, W. 12.

Norchard Syndicate.

NORCHARD SYNDICATE, LTD. (180 553). Private company. Registered March 23. Capital, £1 000 in £1 shares. To construct, maintain, and work electric generating stations, to produce and use electrical energy, and supply the same to towns, collieries, buildings, factories, mines, railways, tramways and others, &c. Permanent directors: W. T. Kerr and G. C. Woods. Registered office: 3, Newcourt, Lincoln's Inn, W.C.

North-Western Electrical.

NORTH-WESTERN ELECTRICAL COMPANY, LTD. (180 477). Private company. Registered March 21. Capital, £100 in £1 shares. Electrical engineers and contractors, &c. First directors: T. C. Hartley and J. T. Storey. Secretary: J. T. Storey. Registered office: 55, Strand, Barrow-in-Furness.

The DYNAMICABLES' ANNIVERSARY DINNER will be held on Tuesday, April 4, at the Trocadero Restaurant, London, W. Mr. A. A. Campbell Swinton will preside.

Foreign Notes.

The capital of the COMPAGNIE FRANCAISE DES CABLES TELEGRAPHIQUES, of Paris, has been increased from 16 to 24 million francs.

According to the "Iron Age," of New York, out of 22 409 tons of STEEL CASTINGS PRODUCED IN CANADA last year, 13 984 tons, or 62·4 per cent., were made in electric furnaces. The best record in the production of electric steel castings in the United States was in 1920, when the castings made in electric furnaces were only 12·4 per cent. of the total.

From Jan. 1 last the METRIC SYSTEM has been employed in official transactions of the Russian Soviet Government, and from the beginning of 1924 it must be adopted for all commercial transactions. On the 1st prox. the system will be introduced into Japan, and after five years it must be used in towns, and after fifteen years in the rural districts of the Empire.

It is stated that the railway system of GUATEMALA is being extended by the construction of an electric line into the highlands of Los Altos. The current will be derived from hydraulic power. The cost of the undertaking is estimated at about £450 000, and this sum is to be raised by means of a special excise duty on arguardiente—a spirit distilled in the Republic.

At RADOM, in Poland, there are electricity supply works of 913 kW capacity, and electric current is supplied on the d.c. three-wire system at 220 and 440 volts. The plant is practically all German. There are two 235 kW and four 40 kW A.E.G. and one 283 kW Siemens-Schuckert dynamos. There are two Diesel engines of 350 and 400 H.P. respectively, two Wolf locomobiles and one Borsig steam engine. The total connections are about 2 040 kW, and the price of electricity for lighting is 140 marks and for power 94 marks per unit.

In an article in the "Times Trade Supplement" on the development of Palestine, the writer states that the Government of PALESTINE has already granted a provisional concession for the use of the falls of the Upper Jordan and its affluents and of the river Tarmuk for the generation of electrical power, and for its distribution throughout the country. Preliminary work, it is stated, is likely to be begun within the next few months. When fully executed it should, if the anticipations of the engineers are realised, furnish Palestine with an abundant supply of cheap power, as well as with a surplus of water for irrigation.

The permanent Commission of the SWISS FEDERAL RAILWAY ADMINISTRATION has decided to return to the Council of Administration, for its favourable consideration, the plans for the enlargement of the electric power station at Amsteg, which will be fed to an equal extent by the mountain torrents Kerstelen and Etzeli. According to the "Gazette de Lausanne," the credit required for the execution of these plans amounts to 6 000 000 francs.

Plans for the ELECTRIFICATION OF THE LINE LUCERNE-OLTEN-BASLE (for which a credit of 28 300 000 francs has been asked) have been approved by the permanent Commission and have been transmitted for approval to the Council of the Administration of the Federal Railways.

There appears to be an abundance of water power in PARAGUAY, according to a correspondent of the "Times" Trade Supplement, but so far there has been no hydro-electric development. It is thought 40 000 H.P. could be obtained from the river Acaray at Puerto Embalse, and there are several other sites available. There are few manufactures in the country, but cheap hydro-electric power would greatly assist the mining, saw milling and logging industries, and there would also be a steady demand for electric traction. Transport and railway facilities are very poor, and it is anticipated that futuro railway construction would be designed for electric working, so that there are reasonable prospects for any electricity supply schemes.

Statistics of electrical progress in FRANCE show that in 1920 the capacity of manufacturing firms had greatly increased over that of 1913. The number of persons employed was 170 000, compared with 50 000 in 1913, and the relative value of manufactured goods had been doubled. In electricity supply 2 230 million francs were invested, against 1 350 millions in 1918, the number of employees being 15 000 against 9 000, the length of the distribution lines over 12 000 km., and the capacity of the plant 820 000 kW. In hydro-electric schemes over 1 700 million francs have been sunk, against 1 514 millions at the end of 1920, and the plant installed, which totals 1 100 000 H.P. (against 965 000 in 1920), supplies districts with a population of over five millions, and the undertakings have over 19 000 km. of transmission and distribution lines.

Exhibition Notes.

Arrangements are being made to hold an EXHIBITION OF WIRELESS TELEGRAPHY shortly in Rome. Eighteen firms will be represented, and different types of instruments, including the latest developments, will be shown working.

An ELECTRIC VEHICLE SHOW is to be held in New York from April 3 to 15 under the auspices of the Automobile Bureau of the New York Edison Company. The first week will be devoted to a display of pleasure cars, trucks and batteries, and the second week to an exhibition of industrial trucks and batteries.

COMMERCIAL INTELLIGENCE.

County Court Judgments.

[Note.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

B J. O. ELECTRICAL SUPPLY COMPANY, Pershore-street, Birmingham, electrical goods manufacturers. £28 5s. 9d. Jan. 19.

BURGE, A., & COMPANY, 300-304, Garratt-lane, Earlsfield, electrical engineers. £18 3s. 7d. Jan. 17.

HURWORTH, W., 41, Town-street, Horsforth, electrical engineer. £20 0s. 10d. Jan. 26.

LONGBRIDGE ENGINEERING COMPANY, Great Darkgate-street, Aberystwyth, electrical engineers. £16 8s. 9d. Jan. 18.

MASKELL, WILLIAM, University Laboratories, Downing-street, Cambridge, electrical engineer. £16 10s. Jan. 25.

ROBINSON, David, 65, Hockley-hill, Birmingham, master electrician. £25 18s. 9d. Jan. 25.

Mortgages and Charges on Limited Companies.

[Note.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

BOURNE END & DISTRICT ELECTRICITY CORPORATION, LTD. Registered March 13, £1 102 8s. 10d. debentures, dated Feb. 28, 1922, part of £20 000; charged on land at Bourne End, also general charge. *£15 122 8s. 10d. March 2, 1922.

EVANS (ELECTRICAL), LTD., London, E.C. Registered March 17, £300 first debentures; also registered March 17, £1 040 second debentures; general charge. *£1 100. Dec. 31, 1921.

Satisfactions.

EVANS (ELECTRICAL), LTD., London, E.C. Satisfaction registered March 17, £1 100, registered Jan. 3, 1922.

OLDHAM, ASHTON & HYDE ELECTRIC TRAMWAY, LTD. Satisfaction registered March 14, £15 800, registered from Nov. 11, 1901, to April 7, 1905.

Private Meetings.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

KNIGHT, W. L. (trading as W. L. KNIGHT & SON), 6, Oak-end-way, Gerrard's Cross, electrical engineer. A circular has been issued to creditors stating that a meeting was recently held, and an investigation into the position has now been completed by Corfield & Cripwell, accountants, Balfour House, Finsbury-pavement, E.C. The statement of affairs showed liabilities of £806, while, after allowing £46 for preferential claims, the assets were estimated to realise £331, or a deficiency of £475. Assets comprised cash at bank, £2; stock at cost, £274, expected to produce £100; book debts, £393, estimated to realise £150; work in progress, £20; plant, machinery and loose tools, £100, valued at £50; and office furniture, £5. With regard to the stock, this is stated to be of a very miscellaneous character, and at a forced sale might realise poorly. The book debts were owing from some sixty or seventy customers, and were all for small amounts. In accordance with a resolution adopted at the meeting, the debtor had executed a deed of assignment with Mr. W. A. J. Osborne as trustee. Mr. Osborne reports that the business is being carried on for the time being, pending an offer being made for the concern.

THANET ELECTRIC COMPANY, LTD. (in voluntary liquidation), Margate. At a meeting of creditors held recently in London, it was reported that an extraordinary general meeting of the shareholders had previously been held in London, when a resolution in favour of voluntary liquidation was passed, and Mr. H. Kirby, of 840, Salisbury House, E.C. 2, was appointed as liquidator. The liquidator stated that the liquidation was a formal matter, and the business had been purchased by a well-known trader at Margate, who intended to carry it on. The whole of the liabilities have been or would be paid in full.

London Gazette.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

Winding-up Petition.

SWIFT ELECTRICAL, LTD. A petition for winding-up has been presented by Watshams, 33, King-street, Covent Garden, London, electrical engineers, and is to be heard at the Royal Courts of Justice, Strand, London, W.C. 2, on Tuesday, April 4.

Bankruptcy Information.

DICKEN, William John (trading as W. DICKEN & SON), 2, Upper High-street, Bargoed, Glamorgan, electrical engineer. Receiving order, March 21. Debtor's petition.

RAWCLIFFE, Frank (trading as FRANK RAWCLIFFE & COMPANY), 8, Nun-street, Newcastle-upon-Tyne, electrical engineer. Receiving order, March 21. Creditor's petition.

Partnership Dissolved.

KINGHAM, William Allan, and PURCELL, Samuel, electrical engineers and contractors, at 75, Pasture-road, and 176, Boothferry-road, Goole, York, under the style of KINGHAM & PURCELL, by mutual consent as from Nov. 26, 1921. Debts received and paid by S. Purcell.

Books Received.

"Isotopes." By F. W. Aston, M.A., D.Sc., F.R.S. (London: Edward Arnold.) Pp. viii.+152. 9s. net.

"Manuale per il Collando delle Macchine Elettriche." (Milan: Ulrico Hoepli.) Pp. xiv.+463. L.18:50.

"Chemistry and Civilisation." By Dr. A. S. Cushman. (Boston: The Gorham Press.) Pp. 151. $2.50 net.

Forthcoming Books.

Benn Brothers are publishing almost immediately "The Structure of the Atom: Notes on Some Recent Theories," by Dr. Stephen Miall. This little book sets forth in a popular and breezy style, but not the less scientifically, some modern ideas, which should prove of great interest, not only to the scientist, but also to the general reader.

The firm will also shortly publish a "Life of George Westinghouse," by Henry G. Prout. This volume is a record of a life of wonderful activity, an intimate disclosure of heretofore unrevealed industrial episodes, and an interesting analysis of the engineer's part in modern civilisation.

Companies' Meetings, Reports, &c.

British Insulated & Helsby Cables Ltd.

The twenty-sixth ordinary general meeting of shareholders of British Insulated & Helsby Cables, Ltd., was held on Monday at the Exchange Station Hotel, Liverpool, Mr. James Taylor, J.P., chairman of directors, presiding.

The chairman, in proposing the adoption of the report and balance sheet, said the year's profit of £502 524 was an increase of £161 811 over the previous year, a result which the directors considered highly satisfactory. This amount of profit was the largest in the history of the company, but in view of the present unfavourable business conditions it was perhaps needless to say that it would be difficult to maintain this high level. At the last annual meeting he told the shareholders they had to face very large capital expenditure in order to reorganise their works after the war to bring them completely up to date. This expenditure, he claimed, had been fully justified.

There was a special demand to-day for high-tension cables, and no firm in the country was in a better position to supply this demand. Not only were they the largest manufacturers of high-tension and other cables in the country, but they had many subsidiary industries which also had been brought up to date. The facilities provided by the company's large capital expenditure in 1920 enabled them during the last year to execute important orders on their books a year ago, and further promptly to execute other orders subsequently received. The profits were largely due to the improvements carried out in the factory, to the completion of old contracts, and to the judicious purchase of raw material. Two years ago the directors were empowered to raise fresh capital should this be considered necessary. Shareholders would be pleased to note the company had passed through the exceptionally trying intervening period without exercising these powers. They were fortunately one of the comparatively few companies which had not required to increase capital at a time when the rate of interest was high.

The addition of last year's carry forward of £116 863 to this year's profits gave a total balance of £619 388 on profit and loss account. After the payment of debenture interest, preference and interim ordinary dividends, directors', trustees' fees appopriation of £30 000 to depreciation account, and £5 000 to debenture stock redemption fund, there remained a balance of £474 723. From this a further dividend of 6¼ per cent. on the ordinary shares, together with a bonus of 5 per cent., was recommended, making with the interim dividend already paid a total distribution of 15 per cent. for the year. This would absorb £112 500, leaving a balance to carry forward of £362 223. The sum placed to depreciation was £20 000 less than a year ago, but in view of the large amount spent on repairs and renewals, the works were in first-class condition, and the lesser appropriation was adequate.

A year ago, under the heading of Stocks and Work in Progress, an increase of £269 000 was recorded; this year there was a decrease of £404 000, accounted for by the smaller volume of trade and the decline in the value of materials. A decrease of £423 813 in sundry debtors represented a great falling off in trade, as also did the fact that they owed their bankers nothing and had in hand £519 893, but the latter figure indicated the company's strong cash position. Referring to concerns in which the company had large holdings, the chairman said the Midland Electric Corporation had done well during a trying year; the Electric Supply Company of Victoria, Ltd., was conducting negotiations with the Corporations of Bendigo and Ballarat, with favourable hopes of a settlement; and the Automatic Telephone Manufacturing Company, Ltd., was, in his opinion, steadily strengthening its position.

Nothing was to be added to the reserve account, which stood at the substantial sum of £250 000, but the carry forward was being increased in order to consolidate the company's position financially. The opinion of the board was that 1922 probably would be a year of difficulties, not only in their own special trade, but in that of the country generally. Under such circumstances they felt that a firm which had ample cash resources was in the best position to face the unknown future, and they trusted the shareholders would approve of the policy of carrying forward the large sum of £362 223, which the board believed to be entirely in the company's best interests.

Sir Harmood Banner, M.P. (vice-chairman), seconded the adoption of the report and balance sheet, and after brief speeches by shareholders expressing satisfaction at the company's position, the motion was carried unanimously.

A resolution declaring a further dividend of 6¼ per cent. on the ordinary shares and a bonus of 5 per cent., making, with the interim dividend already paid, a total distribution of 15 per cent. for the year, was also carried unanimously.

On the motion of the chairman, seconded by Mr. J. Carlton Stitt, Sir Harmood Banner and Sir Alexander Roger were re-elected directors.

The meeting closed with a cordial vote of thanks to the chairman and directors.

Midland Electric Corporation.

In moving the adoption of the report and accounts at the annual meeting of the Midland Electric Corporation for Power Distribution, Ltd., on Monday, Mr. James Taylor (the chairman of the company) said that the profit of the company this year amounted to £105 857, against last year's record of £109 419. The gross revenue for current sold was down about £51 000, but against this they had earned in interest on cash in hand of £15 600, the one being gross, the other net. To the net profit of £105 857 was added £18 517 brought forward, making a total of £124 375. The reserve account had been increased from £20 000 to £45 000. The addition was in respect of the usual item of £5 000 which was being provided in each year, and £20 000 transferred from credit balances. This was in respect of an amount which had in previous years been set aside for sundry liabilities which might have had to be met, but which would not be required. The directors recommended a further dividend on the ordinary shares of 6 per cent., which, with the interim dividend of 4 per cent., made a total of 10 per cent. for the year, leaving £30 604 to be carried forward. He would like to point out that the ordinary dividend of 10 per cent. last year took £17 711, against £28 000 this year. This was owing to the new shares issued last year being now entitled to a full year's dividend. On capital account, during the year they had spent £193 946, and this would have been heavier had the new plant ordered been delivered to date.

The year had been one of great difficulty. First, early in the year they had a serious breakdown at the generating station, but, thanks to the forbearance of their customers and the hard work of the engineers, they kept running, but with a reduced load. Then came the coal strike; again they kept running, but at a very heavy cost, and supplied all the demands made upon them. Then came bad trade, the result of which all were still feeling. Taking those facts into consideration, he trusted the shareholders would consider the results satisfactory. He was afraid that, owing to heavy taxation, labour charges, &c., it would be a long time—if ever—before they could come back to pre-war rates. The inquiry by the Electricity Commissioners into the delimitation of the South-West Midlands area, which included a portion of the company's districts, was successfully opposed, but at rather heavy cost in legal expenses. The inquiry into the scheme for the North-West Mdilands area, in which the company would be included, had recently been held. Under that scheme it was proposed to set up a joint authority to control the supply of energy for the whole area, and it might be necessary for the company to transfer its generating station to that body, on terms and conditions to be agreed, but the distribution of supply energy would remain in the hands of the company. The directors were watching the company's interests, and if and when the scheme took definite shape full particulars of the steps to be taken would be laid before the shareholders.

Davis & Timmins.

The annual meeting of Davis & Timmins was held last week under the presidency of Sir Henry C. Mance (the chairman). The chairman having dealt with the report and accounts (see The Electrician, March 17), Mr. G. E. Davis (managing director) spoke at length on the present strike in the engineering industry. Their works, he said, were closed for the first time since the business was started in 1876. The firm was on the most amicable terms with their employees and the employees with the firm. They (the employees) belonged, of course, to a union, and the firm as employers also belonged to a union—the Engineering Employers' Federation. The dispute was a very clean-cut one. It was not a question of wages or bonus or overtime, or a desire on the part of employers to smash the union, but simply one of whether works should be managed by skilled and expert knowledge in the shape of the employers or by a committee of employees who, collected together at random, had no qualifications for the task of management.

Out of 400 000 members of the Amalgamated Society of Engineers only 50 000 voted—just one-eighth of the whole—and this number plunged the entire 400 000 out of work, not to mention an even larger number of more or less affiliated or sympathetic members of other unions. The general opinion of the men themselves—and their employers in particular—was against this suicidal policy. Fortunately the majority in this country was composed of men and women of sterling common sense, and it was up to the labour leaders to relieve their members from the influence of hotheads who in no way represented labour. It was absurd to suggest that the employers were out to smash the unions. The employers were out to manage their own works, and nothing more. Since the Armistice there had been no fewer than 4 000 strikes, with a loss to the nation of 180 000 000 working days.

With regard to the future, his opinion was that they had touched rock bottom as far as the slump was concerned. Their financial position was particularly sound. They had the sinews of war in the shape of liquid cash, and they had valuable stocks at their disposal. All they required were trade winds set fair, and their recovery would, if slow, be sure and, he hoped, lasting.

Waste Heat and Gas Electrical Generating Stations Ltd.

The report of the Waste Heat & Gas Electrical Generating Stations, Ltd., for the year ending Dec. 31 last shows a profit, after deducting administration expenses and interest on loans, of £35 620, compared with £34 439 in 1920, less £16 000 (£14 000), which has been transferred to reserve. The sum of £12 603 (£17 764) was brought forward from the previous year, making profits available of £32 222 (£38 203). The directors recommend a dividend at the rate of 6 per cent (8 per cent.) for the year, amounting to £19 200 (of this an interim dividend of 1½ per cent. was paid in August, 1921, amounting to £4 800), leaving a balance to be carried forward of £13 022 9s. 9d., against £12 603 last year. The amount standing to the credit of the reserve account is now £143 851, including the amount transferred from the profits of the past year. The redemption funds in respect of plant supplied on hire-purchase terms amount to £21 360. Capital expenditure during the year amounted to £20 664, £15 001 of which was in connection with the new power station at Horden. A further sum of £10 000 will probably be required finally to complete this station and the extensions in connection with the gas engine plant at Weardale. To meet

the above expenditure it has been necessary to borrow temporarily from the company's bankers, and this arrangement will continue from time to time during the current year. The results of the past year were greatly affected by the miners' strike, the whole of the stations being closed down during the three months from April to June, 1921. The plant at the Horden power station was put into operation again in August, and the Teesbridge and Ayresome power stations started up in September, since when these three stations have been running satisfactorily. It is hoped that the Newport plant will be running again at the end of this month. Both the Clarence and Weardale stations are still completely shut down. The aggregate output from all the company's generating stations showed a reduction of 59 per cent. on the previous year.

Tyneside Electrical Development Company announce a final dividend on the preferred ordinary shares of 3 per cent., less tax, making 6 per cent. for the year.

The directors of the South Staffordshire Tramways Company recommend a dividend of 4 per cent. on the preference shares for the past year, carrying forward £462.

Reading Electric Supply Company announce a dividend of 4 per cent. on the ordinary shares for the year. The sum of £5 500 has been placed to depreciation and reserve, leaving £1 779 to be carried forward.

The Isle of Wight Electric Light & Power Company have declared a dividend of 10 per cent. on the preference shares for the two years ended April 30, 1920. The sum of £10 000 has been placed to the renewal fund and £583 carried forward.

The report of Rotherham Tramways Committee for 1921 states that recent economies have resulted in a saving of £23 000 per annum, but owing to a loss of £10 000 per annum previous to 1910, and extra charges for rates, current, &c., this sum is not available for use.

The accounts of the Swansea Improvements & Tramways Company for 1921, after setting aside £20 000 for renewals, show a surplus of £11 913. The sum of £2 099 is brought forward, making £14 012. It is proposed to pay a dividend on the ordinary shares for the year of 6 per cent. and to carry forward £3 613.

The directors of the Singapore Electric Tramways state that since the offer from the Municipality of Singapore for the purchase of the company's undertaking was submitted to a meeting of debenture holders on Feb. 17 last, and rejected, negotiations with the Shanghai Electric Construction Company have been commenced, and are now proceeding.

The annual report of the Siemens Elektrische Betriebe states that the company has been severely hit by the appreciation of foreign, especially Swiss, exchange. The company's debts on this account, the report states, amount to 183 000 000 marks, part of which can be covered from the reserve fund, but there remains an uncovered loss of more than 162 500 000 marks.

The net profit of P. & W. Maclellan for 1921, after debiting bad and doubtful debts, directors' remuneration, and various other charges, making provision for taxes and contingencies, and including £29 578 brought in, was £81 080. The directors recommend a dividend of 8 per cent. on the ordinary shares, payable 4 per cent. on March 31 and 4 per cent. on Sept. 30 next, carrying forward £27 039.

The net profit of the British Engine Boiler & Electrical Insurance Company for 1921, after paying an interim dividend of 7s. 6d. per share (less tax), reserving £1 241 for income and corporation taxes, and adding £5 030 to pension fund, was £24 126. The directors recommand a final dividend of 11s. per share and the usual bonus of 4s. (both less tax), carrying forward £13 416.

The report of the Clyde Valley Electrical Power Company for 1921 shows profit of £106 389, plus £69 693 brought in. After transferring £50 000 to the contingency fund, the directors recommend a final dividend at the rate of 10 per cent. per annum on the ordinary shares, making 7½ per cent. for the year, transferring to second preference share special reserve £1 000, writing down cost of second preference share issue £6 463, and carrying forward £51 547.

Presiding at the annual meeting of the Newcastle & District Electric Lighting Company last week, Lieut.-Col. F. R. Simpson, T.D., said that the total receipts showed a decrease of £16 954, which was accounted for by the three months' coal strike and the general trade depression. The net profit for the year, after allowing £14 000 for depreciation, was £8 100, and with the amount brought forward from 1920 there was an available balance of £22 055. For the first two months of the current year the figures showed an improvement on the latter part of 1920. A dividend was declared at the rate of 4 per cent., less tax, for the year.

Referring to the adverse conditions of the past year at the annual meeting of the Llanelly & District Electric Lighting & Traction Co. last week, Mr. Alfred R. Holland (chairman), who presided, said it spoke volumes for the recuperative power of the business that they were again able to recommend payment of the same rate of dividend upon the ordinary shares as in the preceding two years—namely, 7 per cent., and to place to the credit of reserve accounts approximately £2 000 more than in the previous year. The total units sold during the year 1921 amounted to 9 296 518, as compared with 6 760 839 in the previous year, an increase of 2 535 679 units. The results of the current year, so far as they had gone, showed an improvement, and with a revival in trade and a return to more normal conditions the directors looked forward with confidence to the future progress of the business. Details of the accounts appeared in our last issue.

Arrangements for the Week.

FRIDAY, March 31st (to-day).

Institution of Mechanical Engineers.

6 p.m. At Storey's-gate, London, S.W. Paper on "The Milling of Screws, and Other Problems in the Theory of Screw-Threads," by Prof. H. H. Jeffcott.

Institution of Electrical Engineers.

London Students' Section.

7 p.m. At Savoy-place, London, W.C. Address by the President, Mr. J. S. Highfield.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, London, S.W. Lecturette on "The Steel-Melting Shop," by Mr. D. P. Dickinson.

MONDAY, April 3rd.

The Farmers' Club.

4 p.m. At 2, Whitehall-court, London, S.W. Paper entitled "Electric Power as an Aid to Agriculture," by Mr. B. Matthews.

Royal Society of Arts.

8 p.m. At John-street, Adelphi, London, W.C. Cantor Lecture, "The Constituents of Essential Oils," by Mr. G. Radcliffe. (Lecture III.)

TUESDAY, April 4th.

Institution of Civil Engineers.

6 p.m. At Great George-street, London, S.W. Paper on "Corrosion of Ferrous Metals," by Sir Robert Hadfield, Bart., F.R.S.

Institution of Electrical Engineers.

South Midland Centre, Students' Section.

7.30 p.m. At the Grand Hotel, Colmore-row, Birmingham. Lecture on "With the Wireless Signal Company, R.E., in E. Africa, 1916-1918," by Mr. J. A. Cooper.

Röntgen Society.

8.15 p.m. At Savoy-place, London, W.C. Paper on "Electrical Measuring Instruments Commonly Employed by Radiologists," by Major K. Edgcumbe.

WEDNESDAY, April 5th.

Institution of Electrical Engineers.

Wireless Section.

6 p.m. At Savoy-place, London, W.C. Paper on "Provision of Power for Wireless Telegraphy," by Capt. J. H. Whittaker-Swinton, R.E.

THURSDAY, April 6th.

Institution of Electrical Engineers.

6 p.m. At Savoy-place, London, W.C. Paper on "Protective Apparatus for Turbo-Alternators," by Mr. J. A. Kuyser.

FRIDAY, April 7th.

Institute of Cost and Works Accountants.

7.30 p.m. At the Chamber of Commerce, New-street, Birmingham. Public Lecture on "The Functions of Works Accountancy," by Mr. J. A. Lacey.

Royal Institution.

9 p.m. At Albemarle-street, London, W. Discourse on "The Evolution of the Elements," by Sir Ernest Rutherford, F.R.S.

Tenders Invited.

UNITED KINGDOM.

Midlothian and Peebles District Asylum, Rosslynlee. April 1.—Six months' supply of electric fittings and fittings for machinery. Forms of tender from the Clerk and Treasurer, 19, Heriot-row. Edinburgh.

Birmingham Electric Supply Department. April 7.—Electric motors, approximately 100. Tenders to include starting panels and sundry spare parts, the sizes of the motors ranging from ½ B.H.P. to 15 B.H.P. Particulars from the City Electrical Engineer, 14, Dale-end, Birmingham.

Edinburgh Corporation. April 8.—Contractors are invited to apply for inclusion in the list of firms with whom orders may be placed for engineering work and maintenance of telephones during the ensuing year. Forms of offer from the City Architect.

Ashton-Under-Lyne Corporation. April 12.—Eight e.h.t. equipments for 6 600 V three-phase 50-cycle system. Specifications from the Borough Electrical Engineer.

Wolverhampton Guardians. April 12.—Installation of electric cables and mains at the Poor-Law Institution, Heath Town. Particulars from the Clerk to the Guardians, Poor Law Offices, Wolverhampton.

Wandsworth Guardians. April 12.—Installation of electric lighting at the Intermediate Schools, Swaffield-road, Wandsworth. Particulars from the Clerk, Mr. F. J. Curtis, Union Offices, St. John's Hill, Wandsworth, S.W. 18.

Walthamstow Urban Council. April 12.—Extra high-tension feeder cable and low-tension distributor and public lighting cables. Specifications, &c., from Mr. G. R. Spurr, Electricity Works, Priory-avenue, Walthamstow.

Dundee Corporation. April 20.—One 12-panel d.c. switchboard, four 3 000 A d.c. circuit-breaker panels, and three starting panels for rotaries. Specifications, &c., from the City Electrical Engineer.

Dumbarton County Council.—Electric wiring and fitting work in the County Buildings, Dumbarton. Specifications from Mr. J. Weekes, 88, College-street, Dumbarton.

Patent Record.

SPECIFICATIONS PUBLISHED.

The following abstract from some of the specifications recently published have been specially compiled by Messrs. Mewburn, Ellis & Co., *Chartered Patent Agents, 70 and 72, Chancery-lane, London, W.C.*

Complete Specifications.

147 046 Compagnie pour la Fabrication des Compteurs et Materiel d'Usines à Gaz. Testing-sets, including electric current transformers, for use with measuring instruments. (30/6/19.)
147 602 Körting & Mathieson Akt.-Ges. Electricity meters for indicating the wattless consumption in alternating-current and three-phase current installations. (11/12/18.)
147 699 Ges. für Drahtlöse Telegraphie. Wave telephone systems. (17/1/19.)
147 758 Latour, M. Thermionic tube amplifying devices. (4/12/18.) (Addition to 127 318.)
147 884 Siemens-Schuckertwerke. Voltrametric electricity meters. (11/3/19.) (Addition to 147 879.)
147 934 Signal Ges. Receiving device for subaqueous sound signals. (16/12/14.)
147 939 Signal Ges. Submarine sound transmitting and receiving apparatus. (10/3/17.)
147 942 Signal Ges. Submarine sound-producer. (25/2/18.)
147 943 Signal Ges. Device for preventing disturbing noises in polarised electro-magnetic sound apparatus. (4/5/18.)
147 944 Signal Ges. Device for preventing disturbing noises in polarised electro-magnetic sound apparatus. (30/5/18.) (Addition to 147 943.)
147 948 Signal Ges. Arrangement for avoiding disturbing noises in listening devices caused by changing circuits associated therewith. (20/4/17.)
148 129 British Thomson-Houston Co., Ltd. Means for obtaining unidirectional potential differences or current of constant value. (22/12/15.)
169 007 Macrorie, A. K., & Shearing, G. Transmitting circuits for wireless telegraphy and telephony. (15/6/20.)
169 008 Larsen, A. Sinding-. Process for obtaining an increased light electrical effect in light electrical cells with alkali metal cathodes and other cells of a similar nature. (15/6/20.)
169 032 Rushen, P. C. (Knorr-Bremse Akt.-Ges.). Automatic compressed air-brake controlled electrically and by compressed air, particularly for trains composed of several motor-vehicles. (26/6/20.)

APPLICATIONS FOR PATENTS

February 7, 1922

3 482 E. Y. Robinson. Generation of high frequency currents.
3 521 T. McKenna (Dictagraph Products Corporation). Telephone signal service.
3 522 T. McKenna (Dictagraph Products Corporation). Signal systems for telephones.
3 523 T. McKenna (Dictagraph Products Corporation). Sectional switchboard frame.
3 524 T. McKenna (Dictagraph Products Corporation). Battery carrier and connector.
3 529 Electrical Apparatus Co. & E. N. Bray. Switch mechanism.
3 532 W. J. Webb. Cleaning inside of lamp bulbs.
3 534 W. R. H. Tingey. Inductance coils for currents at radio frequency.
3 553 Western Electric Co. & G. Deakin. Telephone call distribution system.
3 554 Western Electric Co. Telephone exchange systems.
3 555 W. L. Hoffmann, C. E. Funnell & A. O. Garrett. Storage battery grid.
3 575 Peters, Ltd., G. B. Petter & T. G. Grundey. Electric heating of engines of hot-bulb-type before starting.
3 593 M. H. Petersen. Effecting automatic continuous operation of copying telegraphs. (17/2/21, Norway.)
3 594 Akt. Ges. Brown, Boveri et Cie. Anodes for mercury vapour rectifiers. (18/2/21, Switzerland.)
3 611 & 3 612 F. H. Robinson. Single phase induction motors.
3 616 G. Boudou. Electrically heated air waving appliances.
3 630 Martingnoni. Accumulators.

February 8, 1922.

3 645 L. B. Turner. Wireless telegraph receivers.
3 653 S. George (J. H. George). Rotary contact devices for electric ignition.
3 673 R. Maclaren. Automatic regulator for electric radiators, &c.
3 689 R. M. Radio, Ltd., W. H. Merriman & H. R. Rivers-Moore. Wireless call device.
3 695 Phi-Kappa Synd. & D. Watson. Electric toasting or heating apparatus.
3 697 Naamlooze Vennootschap Philips' Gloeilampenfabr. Glow discharge lamps. (9/2/21, Holland.)
3 698 Naamlooze Vennootschap Philips' Gloeilampenfabr. Gasfilled discharge tubes. (9/2/21, Holland.)
3 701 S. E. & L. C. & D. Ry. Companies & G. Ellson. Live rails in electric traction.
3 703 J. R. P. Lunn. Electric tubular annealing, &c., furnaces.
3 704 J. R. P. Lunn. Connectors for concentric cables.
3 723 & 3 724 Berry's Electric & H. H. Berry. Switches
3 725 E. Urbain & C. Seal. Magneto. (8/2/21, France.)
3 728 Metropolitan-Vickers Electrical Co. & I. N. Whitesmith. Commutators for electric machines.
3 736 Siemens & Halske A. G. Alternating current generators. (8/2/21, Germany.)
3 741 G. Verdonk & D. Lodder. Electric plug contacts. (9/2/21, Holland.)

February 9, 1922.

3 760 Fuller's United Electric Works & A. P. Welch. Fixing covers for switches, &c.

The Editorial, Advertisement and Publishing Offices of "The Electrician" are at 8, Bouverie Street, London, E.C. 4. Telegrams: Benbrotric, Fleet, London. Telephone: City 9852 (5 lines).

The subscription to "The Electrician" is £1 5 0 per annum in the United Kingdom and £1 10 0 per annum Abroad. Advertisement Rates can be obtained an application to the Manager. Advertisement copy and blocks should be received on the Friday preceding date of publication.

THE ELECTRICIAN

ESTABLISHED 1861.

THE OLDEST WEEKLY ILLUSTRATED JOURNAL OF

Electrical Engineering, Industry, Science and Finance.

No. 2290. [No. 14. Vol. LXXXVIII.] FRIDAY, APRIL 7, 1922. Prepaid Subscription U.K., £1 5s. per ann.; Abroad, £1 10s. Price 6d.

CONTENTS.

EASTER HOLIDAYS.

Owing to the Easter holidays "The Electrician" next week will be published on Thursday, April 13th, instead of on Friday as usual.

Notes of the Week.

Electricity Supply Bill.

The Committee stage of the Electricity Supply Bill was commenced on Tuesday in the House of Lords. The proceedings, we fear, clearly indicate that dilatory and obstructive tactics are being resorted to in order to defeat or mutilate the measure. Though a motion to refer the Bill to a Select Committee was defeated by 42 votes to 40, there are sixteen pages of amendments, only a few of which are constructive, and it looks therefore as if few of the original clauses will remain if the opposition have their way, as seems likely, for Lord Peel is singularly complacent. From the remarks of some of the noble lords it is evident that they are ignorant of the most elementary facts concerning electricity supply.

The Opposition Analysed.

For instance, Lord Askwith wanted to exclude local authorities from being classed among the undertakers who are empowered to lend money to joint electricity authorities. He appears to be unaware of the fact that the majority of the supply authorities in this country are local authorities which have been in possession of their powers for years. Fortunately, this foolish amendment was negatived without a division. We regret, however, to see that an amendment limiting the operation of the clause to districts having a population of upwards of 50 000 was accepted by Lord Peel and agreed to. This will have the effect of excluding a number of the existing municipality electricity undertakers and so render the Bill practically unworkable, and therefore useless. We do not object to the amendment limiting the liability of Councils which are not authorised undertakers to the amount of a penny rate, because we believe there will be no general need to call upon the rates to make up any deficit.

The Institution—New Council.

As was recently announced, the election of the Council of the Institution of Electrical Engineers, which will take office on September 30th, 1922, will be held under the old dispensation, whereby the retiring Council nominates more names than there are vacancies, and the general body of members are left to make further nominations if they wish. This year, nevertheless, the Council breaks new ground in more than one way. In the first place, Mr. F. Gill, whom we are glad to welcome as President-elect, is at present only an ordinary member of Council, though he has, of course, served one term, if not two, as vice-president. Mr. Gill, as readers of The Electrician know, has had a distinguished career both as chief engineer of the National Telephone Company and, more recently, as European chief engineer of the International Western Electric Company. When the business of the National Telephone Company was taken over by the Post Office it was decreed that those in the more responsible positions should not pass into Canaan. Had a different policy been followed subsequent history might also have been different. Who knows? Mr. Gill is the first telephone engineer who has been president since the days of Sir John Gavey. That is an additional reason for welcoming him at a time when so much fierce light is being thrown on telephone organisation and when the technical problems in that branch of electric science are being both more interesting and more difficult.

A Useful Working Body.

Dr. W. H. Eccles, Mr. A. A. Campbell Swinton, and Sir James Devonshire, who are nominated for the two vice-presidencies and the honorary treasurership, are already serving in those capacities, and therefore require no introduction. Mr. J. W. Beauchamp, Mr. A. C. Cramb,

Major K. Edgcumbe, Dr. C. C. Garrard, and Mr. W. M. Selvey are nominated for the three vacancies among full members on the council; Mr. F. W. Crawter, Mr. A. B. Hart (of the Post Office), and Mr. W. R. Rawlings are nominated as associate members, and Mr. D. N. Dunlop is nominated, after a minimum period in retirement, as an associate. This, it will be agreed, is a useful working list, and Mr. Beauchamp's nomination, no less than Mr. Dunlop's, is a triumph for the new ideals that the Institution has in view. Mr. Cramb should be able to establish a useful *liaison* between the Institution and the I.M.E.A., and manufacturing and contracting interests will also be well looked after. Whatever the results of the election, we should have a good strong progressive Council drawn from those younger members who have up to now had little experience of Council work.

Cable Manufacturers' Results.

In our last issue we analysed the past year's accounts of the British Insulated and Helsby Cables, and were able to congratulate them on a record profit. But other cable and wire manufacturers also appear to have had a successful year, for W. T. Henley's Telegraph Works Company's net profit in 1921 was the largest in its long history, and the total of the London Electric Wire & Smith's was only £4 900 less than in 1920. No doubt the cable makers are the best organised branch of the electrical industry, and the good results of the past year's working are the direct result of this organisation, coupled with conservative methods of finance. The Henley ordinary dividend is maintained at 15 per cent., but the amount carried forward (£260 244) is nearly £80 000 more than the sum brought in. This company complains of the great difficulty, owing to depreciated exchanges and competition, of dealing with the demands from foreign countries. Signs of improved home and colonial trade are, however, reported, but such foreign orders as were obtained were taken at unremunerative prices. The London Electric Wire dividend (7½ per cent.) is the same as in 1920, but the amount carried forward is greater by £5 600.

T. C. & M. Progress.

The Telegraph Construction & Maintenance Company, whose speciality is the manufacture and laying of submarine cables, has also been able to maintain its dividend of 10 per cent. The past year was one of great difficulty for the company, as for all undertakings which have to maintain large stocks of raw materials. When the market for these materials is falling a great responsibility is laid on the management, but in this case the problem was dealt with so satisfactorily that the profit was £11 241 higher than in 1920. This result was obtained in spite of the turnover being less owing to the coal strike restricting the supplies of wire and other materials. The company's financial position is a strong one, and with the return of stable prices and better trade we feel sure will come increasing prosperity.

Electrical Engineering Companies.

Few reports of heavy engineering firms have been published, but most of those that have indicate satisfactory results, despite the industrial situation. Mather & Platt's experience was better than in any previous year; for the same rate of dividend as in 1920 has been maintained on a larger capital, while the carry-forward is much higher. The percentage of profit on the turnover was slightly less than in 1920, but higher machine capacity enabled the firm to increase the output and to show a larger profit. This firm has always followed a progressive, enlightened policy, and the extensions to the tools and works equipment have been amply justified by the results shown. From the report of the Metropolitan-Vickers Electrical Company we learn that the profit was £440 300, an increase of £38 100 over the previous year, and that after paying debenture interest and providing an increased amount for depreciation there is a net profit of £337 100, or £28 000 more than in 1920. The dividend is at the same rate (12½ per cent.) as in the previous year, and the amount carried forward is £92 800, or £34 000 more than the sum brought in. The Brush Electrical Engineering Company's profit is £319 000, or £33 700 more than in 1920, and again a dividend of 15 per cent. has been declared on an increased capital. There have also been heavier appropriations to reserves and depreciation, and the balance carried forward is up by £70 800. Bruce Peebles & Company are making a distribution of 15 per cent. (of which 5 per cent. is a bonus); Mirrlees Watson are paying 12½ per cent. (10 per cent. as dividend and 2½ per cent. as bonus); Browett, Lindley & Company have declared an ordinary dividend of 10 per cent.; and Stewarts & Lloyds one of 10 per cent. on the preferred ordinary and 12½ per cent. on the deferred shares. Among the better-known companies in the lighter branches of the industry may be mentioned the Pritchett & Gold & E.P.S. Company, which is paying an ordinary dividend of 10 per cent.; while Ferguson Pailin's distribution is 13 per cent.

A Few Sufferers from Depression.

On the other hand, a few firms have been badly hit by depreciation of stocks and raw materials. In this category may be mentioned Davis & Timmins, who report an actual loss on the past year's working. The Edison Swan Electric Company's experience has also been painful, for the directors' report announces that the debit balance for the year ended June 30 last was £344 000, so that after using the reserve of £55 000 the adverse balance is £289 700. The company appears to have been badly affected by strikes and by restricted trade. In addition, there has been a heavy depreciation in stocks, which have been written down by £346 000. In fact, depreciation of stocks is said to be responsible for most of the year's loss. It is, however, satisfactory to be able to record an improvement since November last, and it is claimed that with a moderate revival in trade the outlook would be much more favourable. Important changes have taken place in the directorate, and there is a prospect of litigation with the Philips Glowlamp Works.

"Listening-in."

There are legal and illegal ways of using the telephone; but the number of calls which can with justice be placed in the latter category certainly form only a negligible percentage of the total. On the other hand, the number of calls in which it is desirable that the information passing should only be heard by the two persons communicating, not because the purpose of the conversation is in any way illegal, but because it is private, is certainly much larger. The question, therefore, arises to what extent do operators habitually listen-in on subscribers' conversations, and if this undesirable practice is general what means other than disciplinary action can be taken to prevent it. It may be said that, apart from automatic systems, there are no means of preventing listening-in, though there are schemes in which the requirement of strict privacy is approximately met—more or less as a side line.

The Technical Difficulties of Prevention.

Thus, when keyless cords are employed the insertion of the answering plug puts the operator's telephone in circuit with a caller's line. But when the calling plug is inserted in the multiple jack of the calling party, and the called subscriber has answered, the operator's telephone is cut off and she cannot reconnect it in the ordinary way of business. Even so it is possible for her to listen-in by inserting the answering plug of another pair into another multiple jack of the called party or into a jack of the calling party and so satisfy her curiosity and perhaps gain useful information. Theoretically, however, even this action can be prevented by using a device to short circuit the operator's telephone when the answering plug is inserted in a multiple jack, though this would introduce considerable complications, making it practically impossible of employment on existing boards.

The Chief Safeguard.

The chief safeguard against such curiosity on local lines is that normally the operator is too busy with her own work to worry about other people's business. At other times it is a habit—if it be a habit—which should be strenuously discouraged by the authorities. For even high rates and a service that is not perfect will not more quickly give the telephone a bad name than the idea that it is not private. On trunk lines—and it is because of certain recent happenings on trunk lines that the question has arisen—the operator must " listen-in " on occasion to ask whether a subscriber will break his local call to take up a trunk, so that there has to be at least one position on which an operator can overhear. At the same time, the end of the call must be notified, and this applies equally on automatic as on manual exchanges. The maintenance staff, too, are sinners, inasmuch as from time to time they must enter circuits and can then, of course, overhear any conversation so proceeding if they wish to do so. In practice, however, the attraction is not so great as to make it worth while, and it is therefore a case where for many reasons discipline is better than electricity in effecting the cure.

Electric Welding and Ship Construction.

Electric welding is now a familiar and established process in ship construction. We therefore notice without surprise that Mr. A. T. Wall, in a Paper read recently before the Institution of Mechanical Engineers, speaks highly of its advantages in replacing rivets, always a source of latent weakness. For the assumption that plates are only weakened in proportion to the area punched out is not confirmed by facts; the weakening is so much greater that when special strength is desired flush joints with riveted straps are usual; but even with this arrangement theoretically only 81 per cent. of the strength of the intact plate is obtained. Electric welding, on the other hand, allows the use of practically 100 per cent. of the material for strength purposes, and has other economic advantages. For instance, the saving in weight by the use of electric welding methods amounts to 5 per cent. of the total weight of steel in the ship. The author also remarks that welding, while resulting in a more efficient structure, should not cost more than riveting. The saving in weight is of special value in warships and high-speed merchant vessels, because the horse-power needed for propulsion can be materially reduced. One point of great importance, however, is the human element. Welders should not only receive a specialised training, but should be men who are morally incapable of doing scamped work or covering up defects.

The L.C.C. Trolley Omnibus Proposals.

Misfortune seems to attend every attempt of the London County Council to improve its tramway system or to increase the transport facilities in the Metropolitan area. A couple of years ago a somewhat ambitious tramway extension scheme was wrecked by the borough councils insisting upon exercising their right of veto, and this year's Bill, containing powers to experiment with trolley omnibuses in the Lewisham area, has met with a similar fate. The Lewisham Borough Council refused to give its consent on the ground that overhead wires were unsightly, and, though the Ministry of Transport were favourable, the House of Commons, by 86 votes to 72, supported the Borough Council and have refused to allow the Bill to proceed. This is to be regretted, for undoubtedly the trackless trolley is much cheaper than the conduit system, and it has other advantages in areas where traffic is not heavy. The episode is a further illustration of the chaotic condition of local government in London and of the urgent need of a central traffic authority to deal with all questions relating to transport in the Metropolitan area. For the veto of the Borough Councils is used to obstruct, and should be treated as befits obstructions.

Glasgow's Tramway Undertaking—A Contrast.

To compare the fate of the London County Council Bill with that of the Provisional Order of the Glasgow Corporation is to be convinced of the difference in treatment that is vicariously meted out to legislative projects. As we have noted, the Bill has been rejected unceremoniously, but the Order of the latter has been passed, after slight modifications only, by a Joint Committee of the House of Lords and House of Commons. It is true that the omnibus clauses aroused strong opposition from railway and tramway companies and other private interests, but the County Councils supported them as they preferred to deal with the Corporation rather than a number of private companies. After a full investigation the Commission sanctioned the running of omnibuses on any route within a ten-mile radius of the city in extension of the existing tramway system, with the consent of the Minister of Transport and of the local authority. There is a right of appeal to the Ministry of Transport.

Municipal Manufacturing Scotched.

But the Corporation, we are glad to see, failed to secure the right to manufacture motor omnibuses, and a limit has also been imposed on the capital expenditure which may be incurred in the purchase of these vehicles. On the whole, this seems to be an equitable decision, and it will enable the Corporation to test the utility of omnibuses on a limited number of routes and to link up certain of the tramway termini, a right which has been more than once denied to the London County Council. Surely what is good for Glasgow cannot be bad for London, and therefore we deplore last week's decision of the House of Commons, which places the Metropolis in a less favourable position than the city on the Clyde.

Electricity Supply Regulations.

In the new edition of the Electricity Commissioners' Regulations for (*a*) securing the safety of the public, and (*b*) for ensuring a proper and sufficient supply of electrical energy, the only alterations appear to be those rendered necessary by the changes in administration made by the Electricity (Supply) Act. Hitherto four forms of these Regulations have been in use, viz., two for the provinces and two for London, in each case one being for companies

and one for local authorities; but only the provincial Regulations have been issued on this occasion, as the whole of London is already supplied by electricity undertakers, and no Special Order authorising the supply of electricity is likely to be issued for this area. In the past, when companies have desired to change the system of supply or the pressure or frequency, the consent of the local authorities, as well as the sanction of the Commissioners, has been necessary, though in the ultimate resort the consent of the local authority could be dispensed with. In view of the necessity for developing a national system of electricity supply, we cannot see that any useful purpose is served by going through the formality of obtaining the consent of the local authority, and we hope that the Commissioners, who are in the best position to judge of the merits of any proposed changes, will now abolish a useless practice. Hitherto it has, as far as we know, only been used for dilatory or obstructive purposes, and in the supply industry there is now no place for any formality which can be employed as a check upon progress.

Trade and Trade Associations.

WHAT, it may be asked, are the proper functions of a trade association? And what, it may be propounded as a corollary question, are the best methods of determining whether a particular association is efficiently fulfilling those functions or no?

Starting at the bottom of the ethical scale, it will perhaps be agreed that the first of the functions is to achieve some form of price-maintenance for the sale of products, but above that we place both as more important and on a higher ethical scale the co-operative dealing with matters that arise to affect and influence the well-being of the association in its relations with the Government, the community, the transport undertakings and other trading bodies. While giving its members full scope to carry on their business in the way that seems to them best, providing only that that way does not include actions which will react harmfully on those with whom they are combined, any association can do most useful work in watching the actions of the bodies we have named and in placing before them views of those for whom they are working, not as individuals but as corporations.

The Highest Duty of an Association.

More than that, it should be the aim, and the highest duty of such a body, to inaugurate research and to provide funds for carrying on that work, which, though not immediately remunerative, is by the strength which it gives to the foundations of the industry of the very greatest importance. Especially is this the case in the electrical industry (for while arguing generally we are, of course, thinking particularly) where the connection between pure science and commerce is closer and more visible than is usual in other cases.

Examined from these points of view, how do the operations of the British Electrical and Allied Manufacturers' Association, as disclosed in their annual report, indicate the extent to which the functions of an ideal association are being performed or neglected? We think it will be agreed that the marks scored are very high.

Research and Scholarship.

Dealing first with research, the B.E.A.M.A. is giving adequate support to the Electrical Research Association, which, as readers of THE ELECTRICIAN well know, is, after the troubles inseparable from infancy, now performing useful work. The association's own research committee has also been reorganised and enlarged so as to represent directly the interests of the sections and to facilitate communication with the E.R.A. The association is playing its part in the operations of the B.E.S.A., on whose various committees and sub-committees it is adequately represented. It is watching the situation with regard to education, and has itself endowed scholarships to assist research in certain subjects and has taken steps to facilitate the introduction of students from overseas into the works of members. In the performance of this, the highest of its functions, the evidence is all that it is doing very well.

Relations with the Government.

Nor are the results less gratifying when we descend the scale a step. A close *liaison* has been established with the Board of Trade, so that the interests of members under the Safeguarding of Industries Act, the Overseas Trade (Credits and Insurance) Act, the Trade Facilities Act, and the Local Authorities (Financial Provisions) Act are being watched. In conjunction with other similar associations much good work has also been done on the problems of railway rates, claims for damage, demurrage tariffs, and conditions of contract. Here, again, it is obvious that views will be heard and concessions obtained more easily in combination than by individual action. Last, but not least, the establishment of a Conference of Joint Industrial Councils and Other Bodies in the Electrical Industry, in which the B.E.A.M.A. is taking an active part, should be of much assistance in presenting the views of both employer and employed to Government Departments and other interested bodies with a single voice. A most important matter in these troublous days?

A Lesson that Need Not be Repeated.

While direct reference to the first function of a trade association, which we have detailed above, is not made in the report, the chairman, Mr. W. O. SMITH, in moving its adoption, remarked in no uncertain terms that, though combination was easy in times of prosperity (when it is not greatly needed), its responsibilities imposed a great strain in times of depression, when the temptation to obtain work at any price was almost too great to be resisted. He pointed out quite rightly that if that temptation is not resisted the electrical industry will find itself in the same unsatisfactory position as when the B.E.A.M.A. was started, and that surely is an experience which even the most individually minded will not wish to repeat. For while association has meant remunerative prices, it has also inspired confidence (where before there was distrust) which it would be suicidal to dispel in view of the better times which must surely come.

We are glad indeed to find that Mr. SMITH is an optimist. There are those who consider that the electrical industry has not seen the worst of the slump. But the chairman of the B.E.A.M.A., putting his faith in the Stock Exchange barometer, declares that though there may not be an immediate boom there should be a slow, solid, and durable improvement. We sincerely hope this cheerful prophecy may be justified.

One Criticism.

Speaking generally, then, there seems every reason to suppose that the British Electrical and Allied Manufacturers' Association is performing its functions to the satisfaction of its members; and therefore for the good of the

electrical industry. It is true the report is an *ex parte* statement, and that there will not be lacking critics both of the association's policy and its actions. On one small point we are numbered among that band. Why is it necessary for the B.E.A.M.A. to hold its annual general meeting in almost Masonic secrecy, not to issue its report until twelve days after it has been confirmed, and then to do so on a day which prevents most of the electrical journals from dealing with it for yet another week? There may be occasions in the history of any such association when secrecy is necessary, but this is surely not one of them.

Electro-Farming.

SEARCHING around eagerly for fresh worlds to conquer, the electrical engineer has not unnaturally turned his attention to the possibilities offered by the farm and all that term implies. We say not unnaturally, for the agricultural industry is the largest industry in this and most other countries. Like other industries, small and large, it has been adversely affected by war and post-war financial conditions, and by the claims of the worker, often well founded, to improved wages and surroundings. If then the use of electricity, by reducing labour costs and increasing output, as it has done in other industries, can widen the margin between income and expenditure its employment is worth serious consideration by the farmer. And if the farmer can be persuaded of these things the matter is equally worth consideration by those supply undertakings which operate in rural areas and whose power load is therefore small and not likely to be anything else for some time to come.

As is well known, a certain amount of progress has been made in applying electricity to farming, notably by Mr. W. T. KERR in Hereford and its neighbourhood, and in France, Norway, Germany, Canada, and the United States, where opportunity has been taken to tap transmission lines and so give a supply to farmers at a trifling cost.

A Useful Piece of Propaganda.

The paper read by Mr. R. BORLASE MATTHEWS before the Institution of Electrical Engineers on Thursday last week is therefore a useful piece of propaganda. Deserting the dusty and crowded roads of the electrical industry, Mr. MATTHEWS has taken up farming for himself, and has, moreover, introduced the electric idea into farming operations. What this connotes will be easily realised by a study of the paper. Electricity, it appears, has so many possible applications in the farm buildings, in the farm house, on the land and in treating the gathered crops that one has only to cudgel one's brains to think of some farming operation and then turn with confidence to the Paper to see how it is done electrically.

Electricity and Agricultural Production.

Leaving out of account for the moment the much discussed possibilities of electro-culture in stimulating the growth of crops, Mr. MATTHEWS is able to show that electricity can be of real use in increasing the production of a farm. To take one example, which is in some sort a reply to the criticisms to which we shall refer later, the lighting of the farm buildings electrically not only allows operations to be carried on in comfort which without it can only be carried on with difficulty or not at all, but leads to a direct increase in productiveness in such operations as egg laying, chicken farming and milking. The use of the small portable electric motor also means an increased production and a saving in labour on chaff cutting, sewage pumping, churning, threshing and such operations, while under certain conditions electric ploughing is an economy which makes its employment well worth considering.

The Electrical Engineer Turned Farmer.

It is here that some examination must be made of the devastating criticisms of Mr. MATTHEWS' arguments and results which were advanced by Mr. LLEWELYN ATKINSON and Mr. BERNARD JENKIN. The electrical engineer is often by nature a pessimist. The same description may be applied with justice to the farmer. When the two are combined in one person we mathematically obtain a mental outlook whose gloom can be better imagined than described. The actions of one with such an outlook are clouded by a cimmerian darkness which needs a vast deal of dispelling, and the result is he is fearful where others would be willing and even anxious to make a trial.

Disadvantages of Electricity.

Nevertheless, Mr. ATKINSON, being Mr. ATKINSON, we must admit that his detailed arguments that it will pay neither the electricity supply undertaking nor the farmer to use the electric device in the extensive way advocated by Mr. BORLASE MATTHEWS cannot be lightly dismissed by calling him a pessimist. He contends that the duties performed by an electric motor on the farm can be equally well, and more cheaply, performed by a petrol-paraffin engine, that though both these devices save labour they do not save one labour unit—a man—and that the chief chance for electricity on the farm lies in electro-culture, which though a poor load does not cost much to install and does do something which cannot be done in any one way. Not a very cheerful outlook, it will be admitted.

But Mr. ATKINSON'S pessimism was nothing to Mr. JENKIN'S. Indeed, we began to think Mr. JENKIN was a sort of super-electrical engineer. In his view the horse is the most efficient machine to have on a farm (and even it is very inefficient), and all machinery is not only expensive to buy but fails to earn its keep by doing things too quickly. Between them these two speakers put up a heavy barrage of anti-propaganda which must have astonished the meeting as much as it must have discouraged the speaker if he were not an inveterate optimist.

Are Things Really So Bad?

But having recovered from the first shock of the attack, it may be as well to enquire whether things are really as bad as these two speakers would have us believe.

It seems to us that both Mr. ATKINSON and Mr. JENKIN made the mistake of comparing ancient with future farming methods. In towns the lighting load is becoming to be looked on as a necessary evil. In obtaining the farming load it may be the deciding factor, both financially and as a weapon in the selling armoury. For a considerable period of the year many essential operations on the farm have to be carried on in darkness made visible by the light of a lantern. Direct savings might easily be effected by employing more modern methods. Mr. MATTHEWS has shown how. The start having thus been made, the advantages and economies of the electric motor on the farm would be magnified in the view of both the farmer, pure and simple, and the electrical engineer turned agriculturist. He could then start to reap those advantages by co-operating with his neighbours so as to reduce initial outlay on equipment and to improve its total hours of use.

Modern Telephony Technically Considered.*

Phantom Telephone Circuits—Combined Telegraph and Telephone Circuits Worked at Audio Frequencies—The Effect of Loading and Amplifiers—A Review of the Present Position.

By J. G. HILL.

In a Paper entitled "Phantom Telephone Circuits, and Combined Telegraph and Telephone Circuits, worked at Audio Frequencies," which was read at a recent meeting of the Institution of Electrical Engineers by Mr. J. G. Hill, the author deals with the effect of loading and the use of thermionic amplifiers in providing efficient long-distance telephonic communication by means of small gauge conductors in underground cables. This constitutes a revolution in modern circuit provision, and makes it an opportune time for a review of the theory of superposed circuits worked at audio frequencies.

The methods most generally employed to provide extra channels for telegraph or telephone communication may be classified under the following heads: (1) The impedance or retardation method of combined telegraphy and telephony over the same wire or wires, and (2) the equipotential method of providing simultaneous channels for telegraphic and telephonic communication over the same wires, and the application of this method to the balancing of telephonic relayed circuits.

Impedance Method.

This method was first introduced by F. Van Rysselberghe in 1882. Combined working is rendered possible by the different impedance of inductance coils and condensers respectively to high- and low-frequency currents. A condenser is placed in series with the telephone and an inductance coil in series with the telegraph branch. The condenser permits the speech frequencies to pass readily in the telephone branch, but opposes a high impedance to the lower frequencies of the telegraph currents. The inductance coil reduces the shunting effect of the telegraph branch on the telephone branch and also reduces the rate of rise of line voltage when telegraph signals are sent, thus minimising the disturbance caused by these signals in the telephone branch.

Van Rysselberghe System.

A high inductive impedance RL is placed in the path of the telegraph apparatus and a condenser C in the path of the telephone apparatus, the two sets of apparatus being joined in parallel and connected to the line as indicated in Fig. 1.

It is of interest to study more closely the effect of the inductive impedance and the condenser in order to find to what extent (if any) the retarded telegraph signals cause disturbance in the telephone set, and, further, how far the retardation affects the telegraph signals themselves. On account of the variable characteristics of the iron cored telegraph apparatus, experiment is usually preferred to calculation in determining the best values of the inductance and capacity required. The fundamental effects may however be studied with advantage from the mathematical point of view.

Let E be a constant applied voltage at A; v be the voltage at the terminals of the condenser at the time t; R be the resistance of the retardation coil; L be the inductance in henrys of the retardation coil; R be the unvarying resistance of a long line supposed to be non-inductive; C be the capacity of the condenser in farads; t be the time in seconds after the application of the voltage E to the circuit.

Then the equation connecting the voltage v with the time during the transient period when the E.M.F. is rising from zero to its steady value E, is

$$\frac{d^2v}{dt^2}+\left(\frac{R}{L}+\frac{1}{CR_1}\right)\frac{dv}{dt}+\left(\frac{R}{CLR_1}+\frac{1}{CL}\right)v=\frac{E}{CL} \quad \ldots\ldots\ldots\ldots(1)$$

The corresponding equation for the value of v at any instant t after the application of E, is

$$v=\frac{ER_1}{R+R_1}\left[\left(-\frac{1}{2}-\frac{\alpha}{2\beta}\right)e^{(-\alpha+\beta)t}+\left(\frac{\alpha}{2\beta}-\frac{1}{2}\right)e^{(-\alpha-\beta)t}+1\right] \quad \ldots(2)$$

where

$$\alpha=\frac{1}{2}\left(\frac{R}{L}+\frac{1}{CR_1}\right) \text{ and } \beta=\frac{1}{2}\sqrt{\left[\left(\frac{R}{L}-\frac{1}{CR_1}\right)^2-\frac{4}{LC}\right]} \quad \ldots\ldots(3)$$

If $R/L=1/CR_1$ and $R=R_1$ the equation for v may be written

$$v=\tfrac{1}{2}E[1-\sqrt{2}e^{-t/cR}\sin(t/CR+\tfrac{1}{4}\pi] \quad \ldots\ldots\ldots\ldots(4)$$

In any case, if β is imaginary the equation assumes a form similar to (4).

Examination of these equations shows that the rate of rise of the voltage is logarithmic, and that by arranging suitable values of R, L, C, and R_1 the rate of rise of the volts may be either advanced or retarded.

If R and L represent the reactance and inductance of a relay at the receiving end of the line and C a condenser shunted by R, at the same point we have the well-known arrangement of the shunted condenser.

*Abstract of a Paper read before The Institution of Electrical Engineers.

Fig. 2 gives an oscillogram of the normal rise of current in an unshunted Wheatstone telegraph receiver, and Fig. 3 shows the more rapid rate of rise obtained by adding the shunted condenser to the same apparatus, the adjustment being made to produce a signal as nearly square (flat-topped) as possible.

In the case of the combined telegraph and telephone circuit the values of R, L and C must be chosen to reduce the rate of rise of

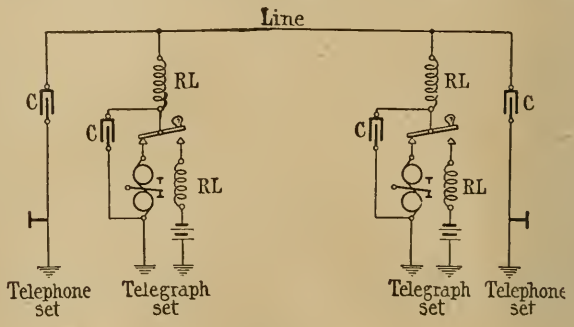

Fig. 1.

voltage at the condenser terminals. It is not practicable with this simple arrangement to eliminate entirely the disturbing effects of ordinary Morse signals in the telephone circuit.

Effect of Retarding Devices.

The rate of telegraph working is largely influenced by the electrical sensitivity of the apparatus employed, as well as its mechanical inertia, so that in practice the rate of working depends on the combined apparatus and line. From another point of view it also depends on the technical nature of the service utilised. For example, in simplex working a higher all-round speed per channel is possible than in duplex working, and, again, a higher speed is obtainable per channel in duplex working than in quadruplex working.

In order to provide a working margin of safety the Van Rysselberghe system is in fact generally worked only at hand speed. If this is assumed, electrical filters may be used to cut off the currents of higher disturbing frequencies.

Composited Circuits.

Fig. 4 shows an arrangement used in England and elsewhere for utilising the two wires of a double-wire circuit to form two duplex circuits. This arrangement is known as composited working. In

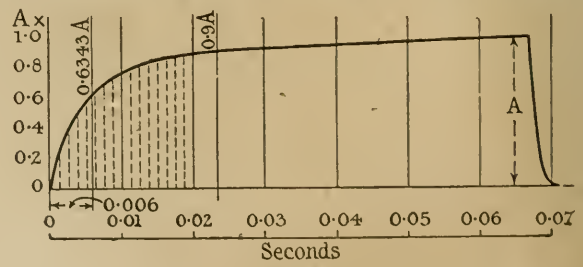

Fig. 2.

this country the arrangement is sometimes used to superpose telephone call wires worked by telegraph upon junction circuits worked on the common battery system (see Fig. 4), or, alternatively, one wire is used as a telegraph call wire, and the other for automatic signalling on the junction circuit. A transmission loss of about one mile of standard cable is usually involved for each set of apparatus.

It may be mentioned that simplexed and composited sets have been used in this country for many years. (A simplexed circuit is a telegraph circuit worked in parallel over the two wires of a telephone circuit.) And as far back as 1908, 200 circuits on the simplexed system were in use in this country. At the same time a large number of circuits were in use for local telephone circuit working on a method devised by Mr. W. J. Medlyn.

According to this method, which is described and illustrated in the Paper, use is made of a length of a main telegraph circuit to form the second wire of a local double wire telephone circuit running on the same route.

Relative Efficiency of the Side and Phantom Circuits.

The Paper next outlines the relations determining transmission efficiency and shows that in the case of open wires arranged on the pole arms at the four corners of a square the transmission efficiency

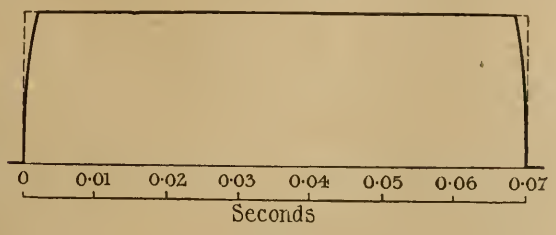

Fig. 3.

of the phantom circuits is slightly less than that of the side circuits. When the four wires are arranged horizontally on the same pole arm the reverse is the case. On unloaded underground circuits also the phantom circuit is of a higher transmission efficiency than the side circuit, so that by superposing we actually obtain an additional circuit which is more efficient than the circuits on which it is superposed.

The transmission efficiency of circuits in submarine cables is also considered. In these cables a secondary phantom circuit is possible over the four wires to earth. The metallic loaded phantom circuit has approximately the same efficiency as the side circuit. The earthed phantom circuit, however, is materially less efficient than the other two circuits, owing to the increased effective resistance, which is observed in such circuits—*e.g.* an increase of about 2·5 Ω per naut per wire at 800 periods per second—owing to the interaction between the field of the conductor and the metallic sheath of the cable, and the effect of the return path consisting of sea water.

Relative Transmission Efficiencies.

In practice, the relative efficiency of transmission of the side and phantom circuits is largely determined by commercial conditions as well as electrical possibilities, the main considerations being as follows:

It is economical to space loading coils as widely apart as possible in order to obtain a given average inductance per mile, but it can be shown that the wider the spacing the more the higher frequencies which enter into the composition of speech are cut off, and beyond a certain cut-off point telephonic speech becomes indistinct and impossible. Owing to the indeterminate nature of the frequencies entering into speech, it is necessary to make experiments to determine the widest permissible spacing. The rule hitherto obtaining as a result of experiment in Great Britain is as follows:

$$CDL=25$$

where C is the capacity of the cable circuit in microfarads per mile, D is the distance in miles separating the coils and L is the inductance

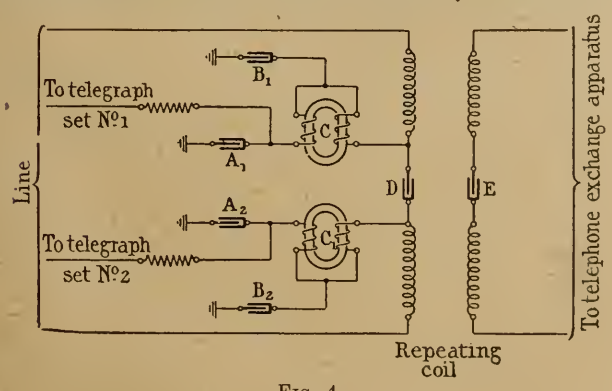

Fig. 4.

of the loading coil in millihenrys. This rule applies to circuits of length not exceeding, say, 350 miles.

Again, in practice it is economical to have only one set of manholes to accommodate both side and phantom loading coils. The most economical arrangement for the two side circuits generally leads to the greatest total economy of the four-wire combination, and the position of the manholes is therefore made to suit the side circuits; this means that there is no choice of spacing for the phantom coils. The only thing that can be done for the phantom circuit is to increase its inductance above the hypothetical value of one-half that of the side circuit up to the limit permissible by the spacing rule, and this procedure gives a phantom circuit having a lower attenuation constant, and therefore a higher transmission efficiency, than the side circuit, usually to the extent of 15 to 25 per cent. (owing to the relatively smaller capacity of the phantom circuit and its higher degree of loading).

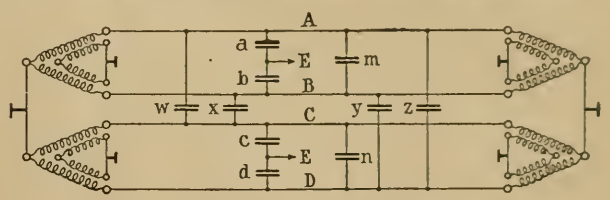
The cheapest possible combination of loading coil and cable (including side circuits and phantom circuits) which will produce the required transmission efficiency is obtained from the formula

$$P=\frac{A}{C}\left(x_2+2+\frac{1}{x_2}\right)+\frac{B\sqrt{C}}{x_2+1}$$

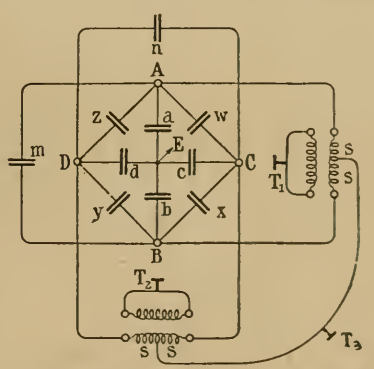
where P is the combined cost of one mile of cable pair and its loading; A is RP_1 where R is the resistance of one mile of a known and selected conductor pair and P_1 its cost; $B=\sqrt{(x/R)}P_2$ where $x=Lm/L$. Lm is the maximum loading of the conductor of resistance R and L is the loading which when combined with R gives the required attenuation constant β. P_2 is the cost per mile of providing L and includes coils and manholes. $C=R(x+2+1/x)$ $=R_2(x_2+2+1/x_2)$. Here $x_2=Lm_2/L_2$, which is the maximum loading Lm_2 for R_2 divided by an inductance L_2, which inductance when associated with R_2 in a cable pair gives the required β. R_2 and L_2 are the unknown values which may be derived from x_2.

Over-hearing and Cross-Talk.

If the circuits are long enough, the mean voltage in a loaded circuit with the same applied E.M.F. is greater than in an unloaded one,



(a) Capacity relations in a phantom circuit



(b) Symmetrical arrangement of the above

Conditions in 4-wire quad for no overhearing and no cross-talk.

and any want of equality in the constants of the A and B lines will result in a greater difference of potential between them, resulting in greater overhearing between the side and phantom circuits, and in cross-talk between the side circuits.

In order to secure a perfect balance, the resistance, capacity, inductance, and leakance of the four wires of a phantom circuit must be theoretically equal. It is possible to a large extent to control the equality of the conductor resistance of the cable in the factory. The inductance and effective resistance of the loading coils in a coil-loaded cable can also be very closely balanced.

A variation of not more than 0·25 per cent. between the inductance of the two halves of the same loading coil and not more than 0·1 Ω between the direct-current resistance of the two halves of the same coil is guaranteed. A variation of not more than 2 per cent. in the inductance of different coils is required and is possible. The leakance of the cable can also be efficiently controlled in manufacture, supplemented by care in laying the cable, and it does not cause appreciable difficulty. The electrostatic capacity of each wire in a four-wire core of the cable cannot, however, be sufficiently equalized in an economical manner in the factory. Special steps are therefore taken to equalize the capacity of the wires in each four-wire group during the process of laying.

Since the mean disturbing voltage in the circuit is much higher in the case of the relayed than the unrelayed circuit, a degree of capacity balance is now required which was not considered necessary for loaded phantom circuits without relays.

Effect of the Introduction of Telephone Relays.

The capacity system of a four-wire core may be represented by 10 capacities between different wires and between wires and earth, and it can be shown that from six capacity measurements the necessary combinations to avoid over-hearing and cross-talk can be deduced. (see Fig. 5). These measurements are made by means of a double-bridge specially designed for use on the road. Apparatus is also designed for the rapid measurement of the degree of equality of the resistance of the conductors. Special steps, however, are required in the factory to reduce the out-of-balance of resistance as far as possible, and this is considered much preferable to compensation on the road by crossing. The reduction of road balancing of resistance to a minimum is therefore aimed at. Incidentally it may be mentioned that it is highly important that the cable constants, including capacity, should be made as uniform as possible in the factory, in view of the exacting requirements of modern developments and the difficulty in replacing non-uniform cables when faulty. The amount of out-of-balance of capacity and resistance which can be permitted depends essentially on the relation between these quantities and the corresponding amount of cross-talk and overhearing resulting from them ; tests of these quantities are therefore necessary.

DISCUSSION.

Sir Andrew Ogilvie said that the Van Rysselberghe system was originally welcomed by the telegraph authorities as a chance of obtaining a share of the telephone traffic. But these hopes were not fulfilled as it could not be employed for ordinary exchange working. It was mainly useful for railway purposes, though the Post Office had employed it to extend the telephone system into rural districts by converting village telegraph offices into telephone call offices. The simplex and composited methods described by the author had not been largely used in this country, probably because the telephone and telegraph business had developed separately. But in a new country the best policy would be to provide telephone circuits and to use them for telegraph working. The super-position of phantom telephone circuits on telegraph circuits was important, and was likely to become of still greater importance in the near future, owing to the employment of thermionic relays on loaded cables.

Limitations of the Van Rysselberghe System.

Mr. S. A. Pollock said that the limitations of the Van Rysselberghe system were fundamental, for it was wrong to depreciate one circuit to gain another. One of the difficulties was that a pure inductance could not readily be obtained without capacity across it, and a very small capacity was sufficient to short circuit the inductance when the instantaneous voltage was impressed. This could be overcome by using a pure resistance associated with a condenser to earth, with the result, however, that the rate of rise of current, and therefore the speed of the telegraph circuit, was adversely affected. Resistance was an essential condition for even partial success with this system, and could not be replaced by inductance as Mr. Hill seemed to think. The winding of the coil provided a capacity between the windings which short circuited both the resistance and the inductance to a certain extent, and even a small capacity was sufficient to disturb the telephone and make the system unworkable. On the other hand, the employment of telegraph phantom circuits on telephone lines provided a field for further development, though it was probable that only a relatively small percentage of the telephone trunk lines in this country could be utilised for such super-position.

Conditions in Composited Circuits.

Mr. A. B. Hart remarked that the curve given by Mr. Hill of the rise of current in a composited circuit did not really represent what happened. The current did not increase smoothly from zero to a maximum value, but was of an oscillatory character. It was necessary in composited circuits to know the maximum frequency which had to be transmitted in order to give satisfactory telegraph working and then to cut off what was unnecessary.

Mr. A. E. Thompson said that the composited method was being used by the Danish and French administrations, while between Copenhagen and Hamburg the American composite method was being employed. A combined phantom and composited circuit was used by the American army between Tours and Chaumont with repeaters at Autun in 1918, a distance of 306 miles, and since then the system had made great progress in America, not only under the Bell companies but by the railway companies. Compared with American methods, the Post Office arrangements seemed to have the disadvantage that the telegraph signals passed through one winding of the repeating coil, which must introduce a certain amount of thump in the telephone. This might be overcome by making the condensers tapped to earth of large capacity, but if these condensers were of greater values than six microfarads the efficiency of telegraph transmission would be reduced.

A Japanese Representative.

The President said he felt sure that members would welcome Mr. S. E. Inada, of the Japanese Department of Communications, who was present at the meeting.

Mr. Inada complied with the President's invitation to speak, and though his knowledge of spoken English makes it difficult to report his remarks, it probably compares favourably with that of his hearers' knowledge of Japanese. Mr. Inada said that the Institution had been a great help to Japanese engineers, and they were making progress on the lines indicated in Mr. Hill's Paper and the Paper read by Mr. Byng earlier in the session. He was particularly interested in the subject under discussion in view of the change from the overhead to the underground system.

Nomenclature Difficulties.

Mr. W. Aitken objected to the term "side circuit." These were more often called physical circuits, which was a much more pregnant phrase. Telephone relays were now of two kinds, non-circuit-closing and circuit-closing, and there should be separate terms for each. There were speech-repeaters and impulse-repeaters. These should also be differentiated. Nowadays telephone circuits were becoming complicated, what with loading, superimposing and amplifiers. They were also to have means of calling over these circuits, and shortly they would be discussing automatically impulsing them. What the circuits would be like in the end it would be difficult to forecast, and still more difficult to understand.

Railways and the Van Rysselberghe System.

Mr. W. J. Thorrowgood did not agree that the Van Rysselberghe system was moribund. Superimposing telephones on telegraphs, and *vice versa*, was not the delicate operation some of the speakers seemed to believe. The Bath-Bournemouth circuit was 76 miles long, with a spur near Glastonbury to Highbridge, making the distance from Highbridge to Bournemouth 72 miles. On that single wire there were fourteen telegraph and sixteen telephone instruments, and it was possible to speak from one end of the line to the other. On the line from Waterloo to Southampton there was a single needle telegraph instrument at each end, and twelve telephones at various places. The separating apparatus consisted of a line from earth to the single needle instrument with two bridge coils, each with a resistance of 750 O. The circuit was connected to the telephone switchboard at Waterloo, on which there were 250 lines, and to the switchboard at Southampton, where there were 200 lines, and each of those extensions could speak over the line. Battery-ringing had been arranged so that any station could call another without interfering with the Waterloo switchboard.

Filter Design.

Mr. C. Robinson said the Post Office had worked out a system of automatic signalling for phantom circuits and side circuits which it was hoped soon to have in commercial practice. The first consideration in designing a filter was the calculation of its cut-off point, but the Paper gave no expression for that.

Mr. C. C. Marris asked how the various machine units of the telegraphs compared with the curves given for the Wheatstone, and what the maximum speed found practicable on circuits with the transformers used in phantom telephone circuits was. He wanted to know how the limit for the magnification of the single relay could be arrived at, and whether that limit was mainly one of cross-talk or of balance, or whether it arose from the possibility of deflection of the repeater. Was there any particular difficulty in balancing phantom circuits for relay purposes ?

Capt. F. Reid said the variation of the capacity in cable circuits was given by Mr. Hill as 1½ per cent., but variations of from 10 to 15 per cent. in single lengths with 5 per cent. on complete coil-loaded section were often obtained. Specifying a certain mean figure sometimes resulted in all the circuits being of low capacity, while in others cases some circuits were very much higher and some very much lower than the mean. It would therefore be as well for cable manufacturers to standardise the capacity for a specified type of cable and fix the limits of capacity variation.

The Author's Reply.

The Author, in reply, remarked that though the sine-wave system would be very valuable in certain conditions, it would be difficult to apply it to circuits when the reactance of the apparatus was considered. The use of filters was an alternative method. Although the telegraph current had a slow periodicity, its rate of rise, particularly with a square signal, was very rapid and made it equivalent to a very high frequency signal. It was the normal thing for the capacity of the phantom circuit to be double that of the side circuit, and that was the variation of the capacity that caused the effect. The filter method was the best way of dealing with the composited circuit using the wires of a double wire circuit to form two duplex circuits. This worked very satisfactorily. He agreed with Mr. Aitken regarding nomenclature, and had followed the terms given in a Paper issued by the American Institute of Electrical Engineers. American conditions did not apply over here, and it was a question how much noise the general public would stand. The price of an approximately silent circuit was the reduced speed.

Radioactivity.*

In the first three of a series of six lectures which Sir Ernest Rutherford, Cavendish Professor of Physics at Cambridge, is delivering before the Royal Institution, reasons are given why radium has been singled out from many radioactive products for practical use. The work of a committee appointed for testing radioactivity is considered, and some practical applications of this substance are detailed. The law of radioactive changes is discussed, the delicacy of radioactive analysis being demonstrated by experiments, as were the characteristics of the products of radio-emanation.

Having, in the introduction to his first lecture, dwelt on the fertile developments that physics owed to the study of radioactivity, the transformations and disintegrations of atoms, the emission of flying particles endowed with undreamt-of energy, by means of which we could probe the structure of the atoms, the discovery of thirty new elements, the shedding of new light on atmospheric electricity and on the age of the earth, Prof. Rutherford remarked that the detection of radioactivity had a history of dramatic interest. In the period of intense activity following the discovery of the Röntgen rays late in 1895, the association of the new rays with phosphorescence suggested to some experimenters that the generation of the rays was itself connected with phosphorescence. Henri Beequerel placed various substances (wrapped in paper), which had been previously rendered phosphorescent by exposure to light, on photographic plates, among them some twelve-years-old crystals of uranium-potassium sulphate. These crystals gave out

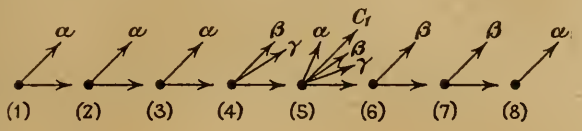

FIG. 1.

a radiation affecting the photographic plate. Fresh exposure to light made no difference, and the property was common to all uranium compounds, as he showed in the "Comptes Rendus" of Feb. 24, 1896.

The Work of Mme. Curie.

The new rays also discharged an electroscope. For his demonstrations Sir Ernest either used a Zeleny arrangement, the gold leaf of which is so suspended from the horizontal plate at the top that it hangs edgeways in front of a vertical plate kept charged from a battery and oscillates at a rate proportional to the rate of leakage from the top plate; or a simpler electroscope in which the substance was fixed underneath a base plate of lead so as to stop all but penetrating radiations. With the help of similar devices Mme. Curie found that the radioactivity was proportional to the amount of uranium in the compound, and was thus a property of the atom of uranium, U, but that Joachimsthal pitchblende (with 70 per cent. of U) was five times as active as it would be if wholly consisting of U. By precipitation with H_2S she then precipitated from the solution of the pitchblende an exceedingly active constituent which she called polonium; she further observed that the barium sulphate precipitated from the solution of the mineral was radioactive, and by fractionation she finally isolated a salt the metal of which, radium, had an atomic weight Ra=226, against U=238. The metal could be electrolytically deposited and had a melting point of

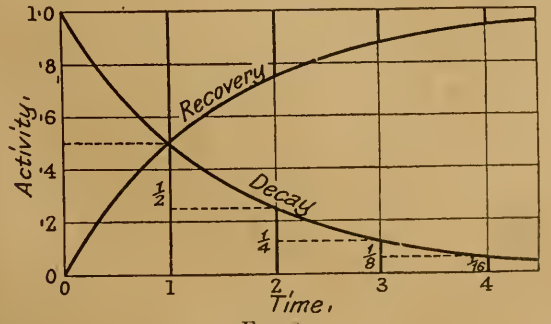

FIG. 2.

about 700°C. If a piece of pitchblende were represented by a line 380 miles long, the amount of radium in it would correspond to 4 in., the polonium to 0·001 in., and the Ra C to 0·0000001 in.

Why Radium is Used.

But why was radium itself singled out from the many products, some of which were much more radioactive? Because radium was easily obtained; it had a long life (half-period, 1 650 years), and gave rise to a large family of descendants of comparatively short life under the emission of α, β and γ rays. Fig. 1 is a diagram of the radium family; the members, the life period, and the ranges of the α particles in air, were: (1) Ra, 1 650 years, 3·5 cm.; (2) emanation, 3·5 days, 4·3 cm.; (3) Ra A, 3 min., 4·8 cm.; (4) Ra B, 26·8 min.; (5) Ra C, 19·5 min., 7·06 cm.; (6) Ra D, radium lead, 16·5 hours; (7) Ra E, 5 days; (8) Ra F polonium, 136 days. Ra A to Ra C are the active deposits of rapid change; Ra D to Ra F active deposits of slow change. As regards the minerals, Sir Ernest remarked, the pitchblende (uraninite) contained up to 80 per cent. of uranium oxides, and the primary uraninite from very ancient rocks was simpler in composition to the secondary blende (from Johanngeorgenstadt, Saxony), in which very small proportions of very many elements seemed to be lumped together. Joachimsthal now produced about 2 grams of radium per year. There was a little pitchblende in the tin mine dumps of Cornwall. Antunite was a complex uranium-calcium phosphate. Most of the uranium now came from the carnotite of Colorado, a yellow vanadate of potassium and uranium, which might contain 51 per cent. of uranium. Though 500 tons of the carnotite-sandstone would yield only 1 gram of radium, the treatment of the ore (dissolution in hydrochloric acid, and precipitation with sulphuric acid) was relatively simple, and the Standard Chemical Company of Pittsburgh had already produced 85 grams of radium (16 grams last year) from this ore. Europe had altogether produced 40 grams of radium, the world, 160 grams; and of that only 5 grams had gone to physicists for research.

Thorium and its first descendant, mesothorium, discovered by

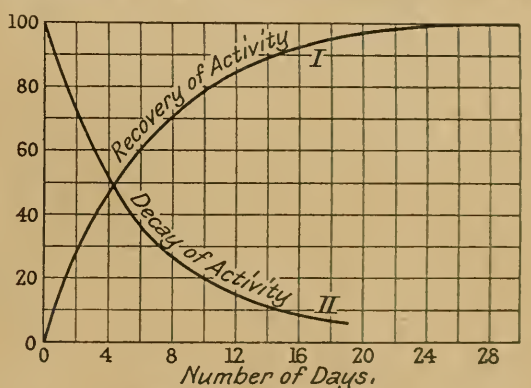

FIG. 3.—THORIUM CURVES.

Hahn (an isotope of radium, differing from it in its radioactivity), was another important radioactive element. Mesothorium cost only half as much as radium, which was now from £20 to £30 per milligram, but had only a life of 6·7 years (mesothorium I., mesothorium II., 6·2 hours). One-fourth of the activity of radium preparations might be due to mesothorium. Thorium occurred in monazite (phosphates of the rare earths, the raw material of the incandescent mantle industry), and some 300 000 kg. of thorium nitrate, equivalent to 5 grams of radium, were produced annually.

The Radioactivity Committee.

A committee for testing radioactivity had been appointed in 1912 (Prof. Rutherford was chairman). Mme. Curie had prepared (at the expense of Sir George Beilby) a standard of 22 mg. of Ra Cl; secondary standards were made in the Radium Institut, Vienna, and sub-standards issued. Tests within 0·5 per cent. of Ra were possible without opening the glass bottle, because the tests were made by the γ-ray method, and because the decay of different mixtures of Ra and Th varied with those proportions largely owing to the shorter life of mesothorium. Such measurements of mixtures took months; for rough tests the α rays afforded guidance, because those of Th had a longer range than the Ra rays. The penetrating character of the X-rays had made it possible to recover £1 000 worth of radium, it was said, from a rubbish heap on which the sweepings of a hospital had been piled. First, the respective heap was identified with the aid of electroscopes; then the portions of the heap; and, finally, buckets charged with the refuse were individually examined.

Some Practical Applications.

Radium salts, added to zinc sulphide to render compass sights, etc., visible in the dark, Sir Ernest continued in the second lecture, bombarded the sulphide with their α rays, so that the sulphide

*Abstract of the first three of a course of six lectures delivered at the Royal Institution by Sir Ernest Rutherford, F.R.S., of the Cavendish Laboratory, Cambridge.

structure was destroyed, and the phosphorescence decayed at a fairly rapid rate. The radium itself did not suffer, and nearly 1 gram Ra was said to have been recovered after the war from superfluous gun sights. Mesothorium might profitably replace the radium in such preparations. The α rays were positively charged atoms of helium moving at about 10 000 miles per sec.; the β rays were swift electrons; the γ rays were of the most penetrating X-ray type. Owing to their greater mass, the α rays carried much more energy than the others, and produced 100 X the ionisations of β particles; but they lost their speed rapidly, and their range in ordinary air did not exceed 7 cm. It was demonstrated that the α rays from polonium were stopped by a sheet of notepaper interposed between the electroscope and the copper-plate on which the polonium had been deposited.

The Nature of Radioactive Elements.

To account for the expulsion of these particles, Rutherford and Soddy had, nearly twenty years ago at Montreal, suggested that radioactive elements differed from others by not being permanently

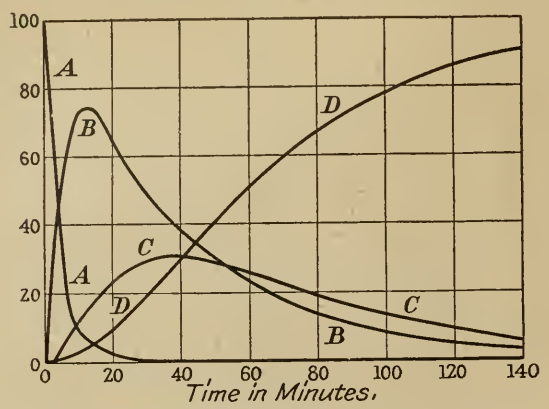

Fig. 4.—Relative Number of Atoms of *A*, *B*, *C*, *D* present at any time. (Case I.)

stable. At any moment a certain fraction became unstable, an explosion occurred, particles were shot out, and the atom left behind was entirely different from the original element. Radium mass 226, lost an α particle (see Fig. 1); the resulting emanation was a heavy gas (not a solid metal), and was itself unstable, emitting another particle, and turning into Ra A once more or a solid metal of mass 218. This broke up into Ra B, which emitted both an α and a β particle, and yielded Ra C, and so on. As regards the rate of change, observations on polonium had shown that the activity dropped to half in 136 days; in another 136 days again to half, *i.e.*, to a quarter of the initial activity, and so on; and that the exponential law had been found still to hold when the activity had diminished to one millionth, no matter what the chemical conditions and the temperature (furnace or liquid helium) were. In a series of successive changes, the equilibrium required that for each atom—*e.g.*, of Ra—an atom of emanation should be produced, while at the same time another atom of emanation was exploded. Supposing we started with pure radium, having removed all accumulated emanation. For each atom disintegrating an atom of emanations was formed, and when the Ra had died down to half, the emanation would also represent half of the activity, the sum remaining constant. Thus the decay and recovery curves were the same, as the ordinates in Fig. 2 indicated.

The Law of Radioactive Changes.

The law which they had first worked out for thorium (see Fig. 3) was the following: If N_o represented the number of initial atoms, N_t the atoms left after t seconds, then $N_t/N_o = e^{-\lambda t}$ where λ was the radioactive constant. T, the time for half-transformation, was $0{\cdot}693/\lambda$ second, and L the average life $= 1/\lambda$ seconds; further, $dN/dt = -\lambda N$, λ representing the fraction of the total number of atoms changing per second. If the decay were A→B→C, P, Q, R being the numbers of atoms of each present, and λ_1 λ_2 λ_3 the respective constants, then (1) $dP/dt = -\lambda_1 P$; (2) $dQ/dt = \lambda_1 P - \lambda_2 Q$; (3) $dR/dt = \lambda_2 Q - \lambda_3 R$, and those three equations gave the P, Q, R at any subsequent time when the initial values were known. The L might amount to a few seconds or many years; L was always $= 1/\lambda$, and Q could be found from P by (2). As regards radium, Fig. 4 represented the number of atoms of Ra A, Ra B, Ra C, Ra D present after certain numbers of minutes; each of these curves passed through a maximum. The rate of change, on which the number of atoms of A, B, C present at any instant depended after removal of the emanation, were indicated in Fig. 5. In order to elucidate these relations, Sir Ernest arranged three vertical glass tubes, partly filled with coloured water, in cascade, tube A communicating by a horizontal pipe (of small bore) near its bottom with the middle of B, and B similarly with C, which had an outlet into D. When the tap between A and B was opened, the level in A fell; in B it rose to a maximum (depending upon the respective heads of water) before A was empty; then the B level went on falling until A was empty. If A had been replenished so as to keep its level constant, the levels in B and C would also have remained steady. That illustrated the decay of a radioactive series—*e.g.*, of Ra in equilibrium with its emanation, exactly the same number of liquid molecules leaving each of the three tubes in each unit of time.

Delicacy of Radioactive Analysis.

Having demonstrated that the electroscope came to rest much more rapidly when excited by actinium emanation (life, 3·5 sec.) than with thorium emanation (54 sec.), Sir Ernest demonstrated the delicacy of radioactive analysis in some striking ways. Actinium would deposit its emanation on platinum foil held above it. In an electroscope there would be no visible film; yet 10^{-17} milligrams would suffice for electroscopic analysis as well as a kilogram. Sir Ernest had prepared such a piece of platinum foil; he cut it in three pieces with a pair of scissors, after having shown it to be strongly radioactive. The first piece was placed in warm hydrochloric acid, then dipped into alcohol and dried over a Bunsen flame; the radioactivity was practically gone. The second piece was heated in the flame; the deposit was volatilised, and the radioactivity lost. The third piece was washed in water only; the activity was retained, because the deposit was insoluble in water; but a similar specimen, exposed to chlorine before the lecture, lost its activity in water because the chloride formed was soluble in water. When the emanation was kept sealed up in thin glass tubes for long periods, only the long-period products survived and coated the glass, which they discoloured. Breaking such a polonium tube up and placing it in warm hydrochloric acid, Sir Ernest dissolved the deposit, which settled again on a piece of copper held in the solution. The solution electrolysed with two small electrodes in circuit with few cells deposited more polonium on the kathode (not on the anode). Another piece of copper exposed to radium emanation proved very highly active; yet there was nothing like a continuous film on it, perhaps 1 atom of Ra C for every 50 atoms of copper in the surface.

The Products of Radio Emanation.

Of the products of radium emanation, Prof. Rutherford stated in the third lecture, Ra A, B, C were the most important. Ra A was very short-lived (3 min.); B could be volatilised at 700 deg., so that C was left behind. This was best done by dissolving the deposit formed on the walls of a glass tube (as just mentioned), and by placing a piece of nickel foil or nickel wire in the warm solution; Ra C was then obtained almost pure, free from Ra B. Thorium emanation (life, 54 sec. only) could similarly be treated, and two-thirds

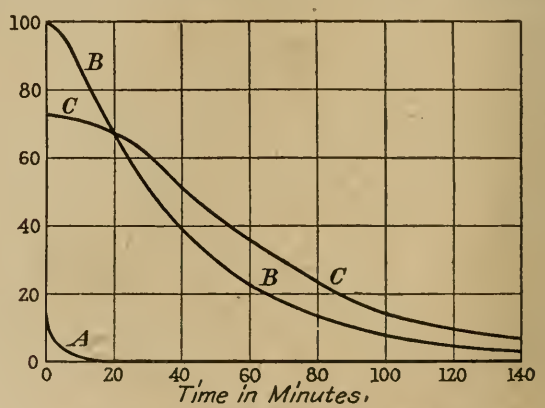

Fig. 5.—Relative Number of Atoms of Matter *A*, *B*, *C* present at any instant. (Case II.)

of the Th C in it would be deposited on nickel. In studying the properties of Ra emanation, Soddy and he had first tried to condense it by the aid of solid CO_2; they had no liquid air machine at the time, but with the first 25 cm³. of liquid air, they later produced, they condensed an emanation at −150 deg. at very low pressure. To prepare the emanation, the Ra salt was dissolved in water in a flask joined to a pump; the rays decomposed some of the water into hydrogen and oxygen (which partly recombined also under the action of the rays); these gases were removed by sparking, and the remaining emanation was condensed in a U-tube. One gram of Ra would, in about 30 days, generate a volume of 0·6 cub. mm. of emanation (in equilibrium at normal pressure and temperature), and with such quantities they had made their studies. Radium salts themselves should not be used for experiments; they were too costly and contaminated the laboratory; in hospitals, emanation confined in tiny glass tubes of common pin size was also

preferable. The very difficult purification of the emanation was effected in delicate glass apparatus as in gas analysis. In order to determine the true boiling point at atmospheric pressure the emanation had been drawn into an exceedingly fine capillary, 1 in. long; there it boiled at −65 deg., and solidified to an orange speck. The atomic weight of Ra emanation was 222; the atomic number, 86; the half-period, 3·85 days. It was the heaviest gas known, the density of the solid being about 5 or 6, and it formed the highest member of the helium-argon group of inert gases. It had a spectrum of some fifty bright lines, quite distinct from helium and other elements, and was strongly absorbed by charcoal, oils and water.

Characteristics Demonstrated.

To demonstrate the character of the gas, Sir Ernest made use of a horizontal glass tube (connected at the one end with a Gaede pump), from which branched off a charcoal tube and three smaller tubes, containing respectively willemite, a mineral giving a red phosphorescence and zinc sulphide. The emanation was introduced into the main tube through a tap and another branch tube dipping into a mercury basin. By wrapping cotton wool round different parts of the apparatus, soaking the wool in liquid air and immersing the charcoal in liquid air, the emanation was condensed first into the tube phosphorescing red; it was then driven by gentle heating into the willemite tube and finally into the zinc sulphide, where it was left, causing the sulphide to phosphoresce with a brilliant green glow in full daylight all through the rest of the lecture.

In the early days it was thought that radium was the direct offspring of uranium. But Soddy did not succeed in growing radium. Boltwood then discovered the intermediate product ionium (period, 100 000 years), which was separated like thorium. To explain the decay, Sir Ernest used, as he had done before, three glasses containing balls of different colours, representing uranium U, ionium Io, and radium Ra. When three ionium balls were transferred to the third glass to indicate that 3 Io had changed into 3 Ra, three radium balls had also to be taken out of their glass, because the radium had itself changed.

If any uranium mineral and the chain of transformations U→Io →Ra . . . is considered all the members of the chain would be present in the mineral and would be present in equilibrium amounts, such that, $N_1/T_1=N_2/T_2=N_3/T_3$ . . . where the N indicated the numbers of the respective atoms present in the order stated (N_1 referring to U, N_3 to Ra) and the T their respective half periods. How we could, by chemical analysis, determine the actual amount of Ra in the mineral; we could not control the growth of Ra by chemical analysis, but we could control it by the electroscope; thus we found the radioactive constant λ_3 for radium, and knowing λ_3 in that case we could determine it for the other transformations; for $N_1\,\lambda_1 = N_2\,\lambda_2 = N_3\,\lambda_3$. . . . Further we knew, that the proportion of radium in uranium was $N_3/N_1 = 3{\cdot}4/10^7$ as to atoms, and $3{\cdot}6/10^7$ as to parts by weight. The λ gave for radium a half period of 1 650 years, the corresponding life period for uranium would then be 5 000 million years.

The Term Life Explained.

What did that life of 1 650 years mean? It meant that of 1 gram of radium which we now possessed there would, in 10 000 (6 × 1 650) years, be left only $1/2^6=1/64$ grams=16 mg. of Ra. The life of uranium would be 5 000 million years—a long time, certainly, but there was not much doubt. If uranium had decayed much faster there might be none left in the world. On the other hand, actinium, Act, had a period of only 0·002 sec.; that was the other extreme. When we looked at the three radioactive families of Ra, Th, Act, they showed great similarities. All gave emanations and deposits and similar bodies showing the usual periodicities of elements in their properties. The nomenclature was not systematic, because workers in different parts of the world had met with new products at different stages of their work. An international congress would settle that. Yet it was extraordinary that all the C products were analagous in their peculiarities. Normally a product gave off an α particle of a definite speed, the same for all the particles of that product. But the C products broke up in two (possibly three) ways; there was, hence, not one uniform way, and it might be a chance whether the one or the other change would take place. Though these questions remained speculative, it seemed that Ra C first sent off a β particle, passing into Ra C, and then an α particle, leading Ra C_2; whilst Th C and Act C first gave the α particle and then the β. He had, however, recently obtained evidence—not unexpected—of a third body in Th C, possibly in the other cases, too, and the changes were certainly complicated. Atoms might exist in more than one state of temporary equilibrium, however. The recent researches made the existence of isotopes of the heavy elements very probable, and the different nuclei of different isotopes would break up in various ways. Actinium, in particular, could not belong to the main branch of the uranium-radium family; its radioactivity was only 4 per cent. of what it should be in that case. Where the branching actually occurred was not quite certain; the genesis seemed, however, to be of the following type, starting from uranium II.

$$(2\times10^6 \text{ years})\ U_{II} \begin{cases} \rightarrow 96\%\ Io\ (2\times10^5 \text{ years}) \rightarrow Ra\ (1\,650 \text{ years}) \\ \searrow 4\%\ Uy\ (25{\cdot}5 \text{ years}) \rightarrow \text{Protoact } (10^4 \text{ years}) \rightarrow \text{Act } (25 \text{ years}) \end{cases}$$

All these transformations of uranium into actinium were accompanied by the expulsion of α particles, except in the case Uy→Protoact, where $\alpha\,\beta$ was ejected.

The discovery of further side branches did not appear likely.

(To be concluded.)

Specifications and Estimates.

At the second informal meeting of the I. E. E. North-Western Centre this session, Mr. Julius Frith opened a discussion on "Specifications and Estimates."

Mr. Frith dealt with the whole machinery by which engineering plant is bought and sold, including the specification prepared by the purchaser or his engineer, the manufacturer's estimate and tender, and the subsequent contract between them. The purchaser and even his engineer might be unable to adjudicate correctly from tenders received owing to omission of particulars necessary to enable them to be compared on the same basis. Two methods of specifying overcame the difficulties arising from merely describing the result desired, the first comprising a precise statement of how the result was to be obtained; the second asking for information from the various manufacturers and selecting the best scheme. A combination of these methods was also used, *i.e.*, an exact description of both results and system to be adopted was specified, coupled with permission to the manufacturer to put forward an alternative scheme. To reap the advantages of standardisation, the purchaser must aid the manufacturer by leaving him free to use his standard materials and methods of manufacture. Tests should be specified in advance, particularly with regard to the quality of materials, the adequacy of the plant in size or temperature rise, and for efficiency. In addition, a penalty or bonus for an efficiency lower or higher than that guaranteed should be given, together with any delivery penalties desirable. Finally the terms of payment should be detailed. Engineering plant designed to effect a given result might differ in first cost, running costs, delivery period, convenience of working, space occupied, weight and appearance, and, Mr. Frith subsequently added, reliability.

The preparation of the tender, which normally followed on the distribution of the specification, was vital to the whole business. Its importance could scarcely be over-estimated. In a large engineering scheme there was always a great deal of purely engineering work, and subsequently a firm had to decide which parts of the tender could be covered by standard products and which parts would require to be made outside. The technical departments having estimated the amount of material, the works departments would require to estimate the amount of labour and other charges.

Reason and Rhyme.

To the subsequent discussion Messrs. S. J. Watson, G. A. Cheetham, A. B. Mallinson, W. Kidd, H. C. Lamb, A. S. Barnard, R. E. Grime, H. Midgley, and W. Eccles, contributed, while a rhymed contribution by Mr. J. H. C. Brooking was read by the Chairman. The general trend of opinion was that the manufacturer should be as free as possible to achieve the results required in any way he chose, and a number of amusing illustrations were given of the absurdity of many specifications and of the manner in which they still embalmed ancient requirements. Considerable emphasis was also laid upon the importance of purchasers conveying to manufacturers the purpose of their inquiry, and examples were cited of schemes which were unduly costly through the manufacturers not being in a position to offer the most suitable arrangement. Some speakers said that a specification should be confined to half a sheet of notepaper, others that all essential points should be covered. The meeting was generally of the opinion that the I.E.E. Model General Conditions should be as widely used as possible. Purchasers were also urged to specify when they wanted an approximate price for the purpose of estimating the cost of a scheme in its preliminary stages and when detailed competitive figures were required. Manufacturers were asked to state in advance whether they proposed to depart from the specification.

The Consulting Engineer Peptonised.

After hearing Mr. Frith's reply we came away from an extraordinarily illuminating and valuable discussion with the impression of the consulting engineer, abnormally vigilant, omniscient, sitting on the fence, holding the scales of justice evenly between the contending factions on either side. In so far as the metaphor is a little mixed, it is unfair to Mr. Frith, but his own fertile mind is responsible. Ruling out the ordinary significance of the phrase the precariousness, prominence, and judicial character of the position will perhaps reflect the consulting engineer's responsibility.

British Electrical and Allied Manufacturers' Association.

Record of a Year's Work.

The annual general meeting of the BRITISH ELECTRICAL and ALLIED MANUFACTURERS' ASSOCIATION was held on March 16, when Mr. W. O. Smith, Chairman of the Council, presided over a large attendance.

The Chairman's Address.

In proposing the adoption of the Annual Report of the Council for the year 1921, the CHAIRMAN said at that the last general meeting he was compelled to deal with the then existing situation in a pessimistic tone. In the light of subsequent events it would be agreed that his pessimism had been justified. In March, 1921, the industry was in a bad state, but it was nothing to what it had been since. For the coal strike had been followed by a business depression such as had never been experienced in the life of the electrical and allied industries.

The Stock Exchange Barometer.

At that time he had remarked that the tone of the Stock Exchange was one of the best indications of the state of the country's trade, but whereas a year ago the Stock Exchange was in the depths of depression, to-day there was buoyancy and optimism all round; and he was convinced that that feeling of optimism would gradually permeate other branches of business so that those who had been holding back would sell out gilt-edged securities and utilise the money so realised to finance new enterprises. A fair proportion of that money should find its way into the electrical and allied industries in the shape of orders, and though the start might be slow, so long as it gradually increased, the improvement was likely to be both solid and durable.

Competition and the Future.

It was easy to run an association like the B.E.A.M.A. when everybody was busy and profits were being made, but it was a different matter when work was scarce, for it was then individual firms were tempted to act for themselves. If the course were generally adopted there would be a scramble for any work and the industry would find itself in exactly the same unsatisfactory position as it had been before the B.E.A.M.A. was started, when only the consumer benefited from a cut-throat policy. If the B.E.A.M.A. had done nothing else it had done splendid work by bringing individual members together to know and trust each other. If this happy state were to be continued patience must be exercised, for better times were coming when the benefit of the bonds of union would surely be reaped.

The Council had authorised the Director to promote a World Power Conference, which by permission of the Executive Council of the British Empire Exhibition would be held at Wembley during 1924. The Association was inviting technical institutions and trade organisations in this and other countries to co-operate, and the exhibition authorites had agreed to give free use of a conference hall and to provide certain entertainments for guests from other countries.

A Personal Explanation.

Continuing, Mr. Smith referred to the fact that he had filled that position of chairman of the Association for three years. He felt that his retirement would be both for the good of the B.E.A.M.A. and of himself. Three years was quite long enough for anyone to hold the chairmanship, and after nearly fifty years of business life he was beginning to feel the need of a little more leisure and less responsibility. Those three years, during which he had not missed a single Council meeting, had been very pleasant years, and it had been a great satisfaction to assist in fostering those great principles of co-operation for which the B.E.A.M.A. stood.

Mr. Smith concluded by tendering his special thanks to the staff of the Association for the willing and prompt manner in which they had invariably carried out his wishes.

THE ANNUAL REPORT.

In the Annual Report of the Council, which was presented at the meeting, it was pointed out that the cures for the disease from which the world was suffering could only be effected by the expiration of time. The steadiness and patience of members under adverse conditions and the highest taxation of any country in the world were sufficient proof that the qualities necessary for taking the fullest advantage of the opportunities of restoring British prestige in the world's markets were present.

A significant indication of the state of world finance was the sudden move during 1921 on the part of almost all countries towards a revision of tariffs. The Association passed under review during the year the tariffs of New Zealand, India, Canada, Spain, and South Africa, and had been successful in the case of New Zealand in securing the admission, duty free, of British electrical apparatus, and in the case of India in obtaining a reduction from 11½ per cent. to 2½ per cent. *ad valorem* of the duty on high tension switchboards, oil switches, motor starters, controllers, regulators, rheostats, and transformers.

It was now the practice throughout all the Dominions that the value according to the current rate of exchange should be the value upon which import duties were chargeable, while an Imperial Conference of Dominion customs authorities which sat during the spring had recommended the general adoption of a standard form of declaration which, however, the Dominions had not yet found it practicable to adopt.

Legislative Work.

The B.E.A.M.A. technical code, which was published during February, represented one of the most comprehensive and complete technical codes in existence. By its use the cost of cabling messages connected with tenders and contracts would be very greatly reduced. Reference is made in the report to the Safeguarding of Industries Act, to the Overseas Trade (Credits and Insurance) Amendment Act, to the Trades Facilities Act, and to the Local Authorities (Financial Provisions) Act. As regards the second and third of these the relations of the Association with the Board of Trade are such as will allow any member desirous of availing himself of facilities to obtain the best confidential advice and assistance.

Co-operation and Unemployment.

During the year Mr. L. B. Atkinson happily seized the moment when the industry was most divided as to the representations which should be made to the Government on the subject of unemployment to form one of the most important of the industrial organisations established in this country, the conference of Joint Industrial Councils and Other Bodies in the Electrical Industry. Thus the industry as a whole can speak to Government Departments with a single voice, a fact appreciated by no one so much as those Government Departments especially concerned with the industrial questions arising out of the present exigencies.

The Electrical Research Association.

The year 1921 was the first complete year of work of the Electrical Research Association. It has now entirely cleared the ground and built the foundations for the superstructure. At the end of the Association's financial year eleven sections divided into thirty-nine committees had been formed, retaining the services of 150 experts in the various branches of research, and it is clear that the establishment of a central body to secure the help and win the confidence of all interested parties from the premier Departments of State to the smallest manufacturing firm is gradually making its way to success. Meantime the Association's own Research Committee has been correspondingly re-organised and enlarged, so as directly to represent the interests of the sections of the Association and so facilitate freer and more expeditious communication of members' research proposals direct to the E.R.A. The Council are of opinion that the present year should see the machinery both of the E.R.A. and the Association's Committee in perfect working co-ordination and giving the fullest satisfaction to all those who have enrolled as members of the E.R.A.

Standardisation.

The Council recall with satisfaction that the interest of members in standardisation has been well maintained during the year. This is an encouraging sign, for nothing is better calculated to consolidate the position of the British electrical industry in foreign markets than the adoption by those markets of British standards.

Reference is made to the stricter interpretations given by the Home Office of the regulations for the installation and use of electricity in mines which had as a result the publication of regulations regarding the safeguarding of surface switchboards. Committees of the Association recommended draft specifications for underground machinery and apparatus, which may result in new B.E.S.A. specifications for mining motors, switchgear, plugs for coal cutters, and other portable apparatus. Reference is also made to the revision of the B.E.S.A. specifications on electrical machinery, the commencement of the work on slow speed steam engine, gas and oil engine and Diesel engine specifications, and to the nomination of representatives to B.E.S.A. sub-committees and panels on various subjects relating to electrical and allied work.

Work of the Traffic Committee.

The Traffic Committee of the Association during the year have concentrated practically their whole attention upon the revision of the general railway classification of goods, which is being undertaken by the Ministry of Transport and the railway companies.

and lodged causes of objection, both in particular and general, to the provisional proposals made by the railway companies on this question. These proposals have also been combated by other branches of industry, and it was found necessary to set up a Co-ordinating Committee with headquarters at the F.B.I. The Rates Advisory Committee found it expedient to recognise this Committee and to suspend its sittings for the time being to permit of its conferring with a committee of the railway companies. This conference resulted in the gradual reduction in the number of objections and the breaking down in great measure of the feeling of antagonism between the traders and the railway companies. Nevertheless, notwithstanding a reduction in the wages of railway workers and a material reduction in the cost of railway plant and material, no reduction has been made in the rates for general merchandise, though a small reduction was made in the rates for fuel, limestone, and lime for iron and steel working.

Railway Rates and Trade Revival.

The Association has been represented on several deputations to the railway companies to urge the importance of a general reduction of rates in the interest of trade revival. The attitude of the railway companies is that they are entitled to make a certain profit regardless of the state of trade and that a reduction in rates would not bring about such an increase of traffic as would enable them to do it. It is satisfactory to note that the Railways Act 1921 embodies a principle of charging which the Traffic Committee of the Association have throughout strenuously advocated, namely, that all rates shall be disintegrated, showing separately the rates for conveyance, station terminals at each end and service terminals for loading, unloading, covering and uncovering. The Traffic Committee also opposed the attempt of the railway companies to obtain the right to carry goods by road, but the attempt was frustrated by the Speaker's ruling that the proposal did not come within the scope of the Bill. Companies are now seeking the same powers in a separate Bill and the Traffic Committee is still continuing its opposition in co-operation with other traders. Several claims of members for damage and non-delivery and warehouse rent charges have also been discussed and attempts have been made to get the question of demurrage dealt with on equitable lines.

Contract Conditions.

The Revising Committee carried through several important amendments to the text of the I.E.E. Model Form of General Conditions and have presented to the I.E.E. a new text based on the model text purporting to cover export work so as to provide for cases where the customer particularly specifies "I.E.E. conditions so far as they may apply." An I.E.E. special committee is now considering the text with a view to recommending their Council to sanction it.

The text of the Association's Conditions of Sale "A," covering sales without erection, suitably amended is now under discussion between the Association and the I.E.E. with a view to joint adoption, and the Association are also co-operating with the F.B.I. to obtain an amendment of the sets of conditions issued by Government Departments where they are considered inequitable.

Assisting B.E.D.A.

The British Electrical Development Association, of which the Association is a founder member, has in the past year considerably increased its membership and consolidated its position. The Council of the Association recommend members to acquaint the secretary of the B.E.D.A. with any new devices and developments in their branch of the industry so that the public may be kept alive to the best and latest practice.

Extending the I.P.S.

The financial year of the Industrial Publicity Service, Ltd., ending April, 1921, showed a substantial development, and preparations are now completed for giving a separate establishment to the propaganda side of the activities of this organisation by means of a new company registered under the name of Industrial Intelligence, Ltd. This organisation which is also supported by the F.B.I., the British Engineers' Association, the C.M.A., and the E.L.M.A. is not intended to be a trading company, but will carry out the distribution throughout the world of news matter of British industrial and commercial interest. Recent reference in the Press to the activity of competing countries and the dissemination of propaganda confirms the opinion that this scheme is very well worthy of support by British trade interests. The main source of funds for the purpose is the profit derived from the advertising agency work of the Industrial Publicity Service which affords another reason why that organisation should be used by members.

The Council have under consideration proposals for participating in the British Empire Exhibition, 1924, and the suspension of the standing rules as to exhibitions has been extended to December 1, 1922.

The number of members on the register of the Association at the end of the year was 200 compared with 224 at the end of 1920.

Recent Extensions at Stoke-on-Trent.

Before electricity districts were thought of, a start towards the co-operation they envisage had been made in that part of Staffordshire, commonly known as the Potteries, by the appointment in 1910 of Mr. C. H. Yeaman, who had previously been Borough Electrical Engineer of the Hanley undertaking, to control and develop electricity supply in the new Borough of Stoke-on-Trent, which comprised the townships of Burslem, Fenton, Hanley, Longton, Stoke and Tunstall.

It will probably be remembered that at that time a direct current supply was given from small stations at Burslem, Longton, and Stoke, and a single-phase supply from a station at Hanley. These soon were supplemented by a supply in bulk from a new power house at Stoke which originally consisted of two 1 500 kW turbo-alternator sets, together with the necessary water tube boilers, cooling towers and auxiliaries.

Result of War Conditions.

Three-phase supply from this station was first given in the summer of 1913, and when war broke out the new system was fully at work. Development continued satisfactorily throughout the war, the load reaching 4 240 kW in 1915, and it soon became evident that it would be necessary to increase the generating plant. A 3 000 kW set and two boilers were therefore started in 1919. Meanwhile Sir John Snell had recommended a further extension of the power house by lengthening the engine room to accommodate a fourth generating set, and the addition of larger boilers and double the cooling tower capacity. This advice was taken, and a further 3 000 kW set and auxiliaries purchased. This extension was put to work on Thursday, March 30. It consists of a 3 000 kW three-phase 51½ period 6 000/6 600 V Metropolitan Vickers turbo-alternator, with surface condensing plant and switch gear.

Details of the Plant.

In design the set follows the standard Metropolitan Vickers practice very closely, and operates with a steam pressure of 170 lbs. at the turbine stop valve, and a super-heat of 200 deg. F. The temperature of the circulating water is 80 deg. F. The condensing plant is of the Leblanc type, and is situated directly below the turbine, the auxiliaries being driven by squirrel cage induction motors provided with auto transformer starters and control pillars. The condenser is provided with a circulating water pump driven by a 110 H.P. motor running at 1 000 revs. per min. The main air and condensate extraction equipment consists of a Leblanc rotary valve dry air pump coupled to a centrifugal condensate extraction pump, the two being driven by a 28 H.P. motor running at 1 500 revs. per min. A duplicate air and water extraction equipment comprising a steam-operated air ejector, and a further centrifugal extraction condensate pump driven by a 8 H.P. motor running at 1 500 revs. per min. has also been installed, pipe connections being arranged so that the ejector can be used either simultaneously with the air pump to assist in starting up or independently, while the separate motor-driven extraction pump can, with the ejector, form a complete standby.

Steam Raising Plant.

The boilers are of the Stirling five drum type, working at 200 lbs. steam pressure. Those installed in connection with No. 4 turbine extension have self-contained fans and double grates, and are fitted with Underfeed "A" type stokers.

Two cooling towers supplied by the Davenport Engineering Company form part of the new extension. They are capable of dealing with 400 000 gallons per hour, and reducing the temperature from 95 deg. to 75 deg. F., with the atmosphere at 55 deg. F. and 75 per cent. humidity One of these cooling towers has a capacity of 228 000 gallons, and the other a capacity of 172 000 gallons.

Coal Supply.

Coal delivery is effected by three electric automatic end tipping vehicles. On arrival at the station it is tipped into four outside receiving hoppers, and thence passes by a series of conveyors into the overhead storage bunkers. The ashes are discharged from the hoppers under the boilers into a set of buckets, which run through to the boiler house and discharge into a receiver pit which is fitted with a crusher. The soot is discharged in a similar manner from separate hoppers into a low-level bin, and both ashes and soot are extracted from these hoppers into wagons for conveyance to a suitable dump.

The switchgear is an extension of the system first installed in 1913, the apparatus employed generally following that supplied with the original equipment. The principal exception is in the type of oil-circuit breaker used. The generators are equipped with the Merz-Price balanced potential protection and automatic field-breaking apparatus.

The Daysohms Utility Arc Welder.

Although we have already described the Daysohms low tension a.c. arc welder (see THE ELECTRICIAN, Vol. lxxxiii., p. 522), we think it will be of interest to our readers to give details of the latest pattern

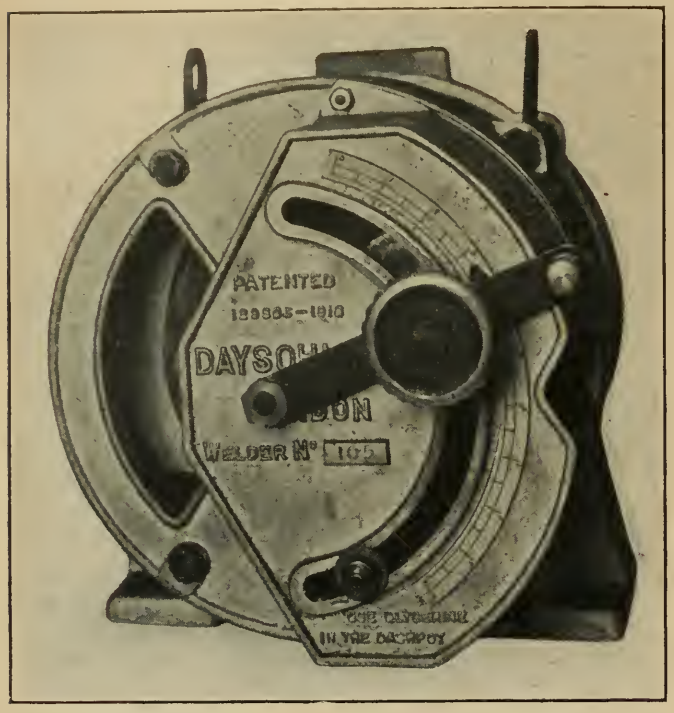

FIG. 1.—THE DAYSOHMS AUTOMATIC CHOKE.

of this machine, especially as it has been designed to supply a very large, but hitherto much neglected market. This market is among the medium and small iron-working shops, such as the motor-car

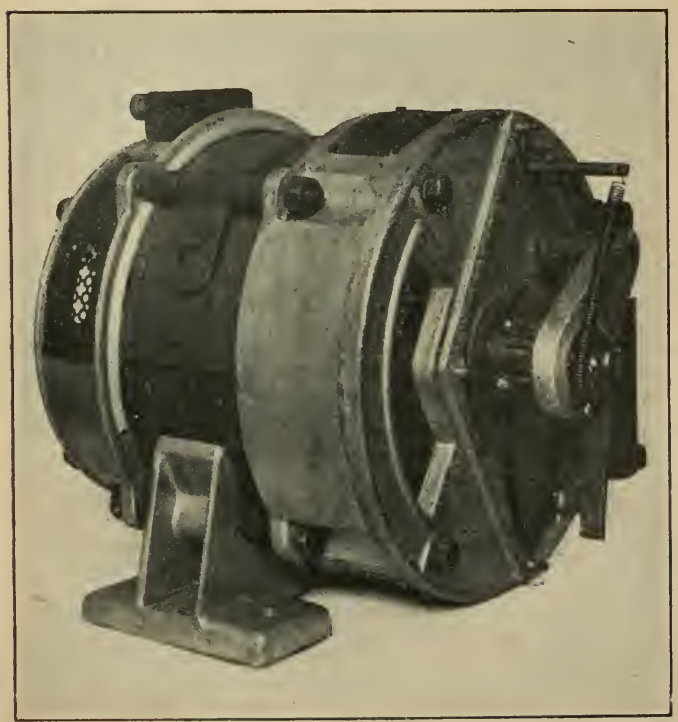

FIG. 2.—THE DAYSOHMS AUTOMATIC CHOKE. HALF-SIDE VIEW, SHOWING DASHPOT.

repairing shop where only two or three men are employed and where not more than 6 or 7 kW for light and power is required.

Most published accounts of work done by electric arc welding have usually dealt with large and impressive operations such as erecting ships' bulkheads and constructional iron work for huge buildings, with the result that the small man is not aware of the vast amount of profitable work that he can undertake by this means. In fairness it must be added that owing to the consequent lack of demand, a simple outfit which may be installed upon such a small circuit as indicated above is hard to come by.

Details of the Equipment.

The Daysohms utility welder is, however, designed to work on ordinary a.c. supply circuits, with a maximum demand of 5 kVA. It can therefore be installed on any lighting circuit; its current range being from 20 to 80 A on the secondary circuit at an open circuit pressure of 55 V. This is sufficient for any normal make of electrode on the market, and work from No. 19 gauge sheet to ¼ in. thick, can be handled as well as larger work in way that is described later.

The outfit consists of a stepdown transformer of 5 kVA capacity and a Daysohms automatic choke, the essential feature of which is that a much lower choke is in circuit when the arc is struck than

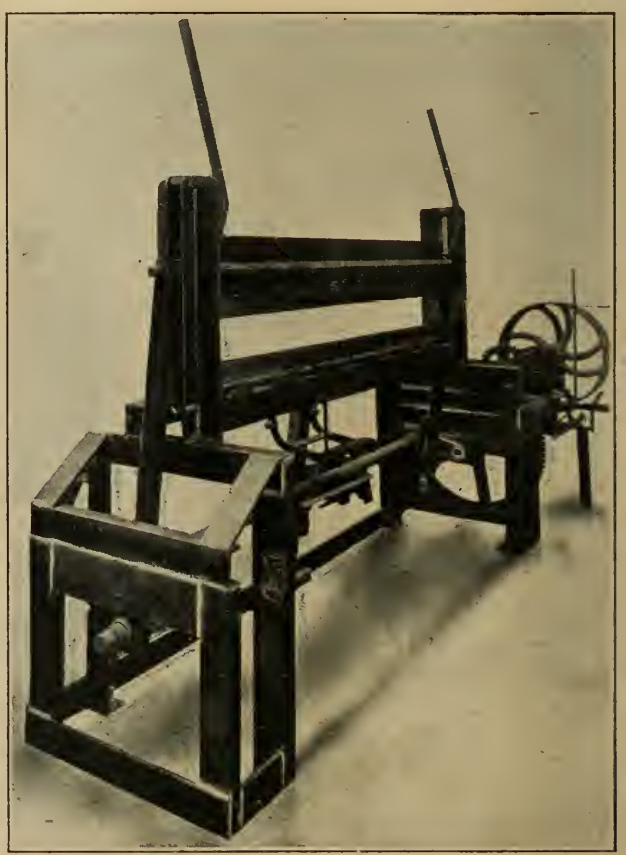

FIG. 3.—A CORRUGATOR BUILT UP OF STRIP AND ANGLE IRON BY ELECTRIC WELDING METHODS.

when it is running. The amount of choke in circuit when striking the arc may also be adjusted, quite irrespective of the amount in circuit with the arc when welding, both these adjustments being continuous and not by steps.

The Importance of Proper Regulation.

Regulation of this kind is of the highest importance when welding thin material, such as No. 19 gauge steel plate. For if a fixed choke is used to regulate the current, the rapidly-falling volt-ampere characteristic produced across the arc space makes it practically impossible to get an arc on striking, with so low a pressure as 55 V on open circuit. If on the other hand the open circuit volts are raised to the normal amount for a.c. welding, viz., 100 to 110 V, the sudden rush of current on striking, in the case of thin material, pierces a hole in the work, whereupon, however small the hole, the electrode, having an edge to work on, starts cutting, instead of welding.

The general construction of the machine is the same as we have already described, with the difference that all the Daysohms

automatic chokes are now fitted with an arm moving over a scale, and a hand screw for locking the arm in position (see Figs. 1 and 2). This arrangement, it is claimed, enables a better adjustment of the welding current to be made, while the scale enables the operator to return to any known position. The standard machine is designed to work at an open circuit pressure of 55 V and on a current range of from 50 to 150 A. The dashpot in all the machines has now been modified by giving it a conical bore, thus reducing its action as the current is reduced, an arrangement which greatly improves the capabilities of the machine for welding thin material.

Advantages of Thin Work.

In the case of No. 19 gauge sheet there is no trouble from buckling, as there would be with acetylene welding, while the current consumed is only 30 A at 55 V, or 1·65 kVA, *i.e.*, an actual consumption of appreciably less than 1 kW, a result that we believe has not been hitherto accomplished.

As the managing engineers of Daysohms Ltd., point out such a welder as we have described when installed in a small but growing iron-working shop would probably rapidly pay for itself by enabling much of the odd gear and fitments required about the shop to be expeditiously and cheaply made up on the spot. That there are grounds for this statement we may show by giving a few examples of this class of work with their cost in labour and materials, which has been executed by The Foster Engineering Company, of Wimbledon, for use in their own factory.

Examples of Work Performed.

Fig. 3 shows a machine for corrugating up to 6 ft. No. 18 gauge steel sheets for welded transformer cases. With the exception of the bearings, which are standard plummer blocks bolted on to the framework, the whole machine was welded up of strip and angle iron, the gear wheels being taken from a dismantled crab. The labour and materials on this machine came to £36, whereas

Fig. 4.—Fly Press, strengthened for Larger Work by Daysohms Methods.

to buy such a machine would have cost at the time it was made about £300, the saving on this one job being sufficient to pay for the welder more than twice over.

Fig. 4 shows a fly-press which has been strengthened, and the whole stand from which the bolts have been removed welded up and strengthened with angle iron diagonals to take the torque.

Fig. 5 illustrates a 6 ft. 6 in. iron door of a transformer house

Fig. 5.—Welded Transformer House Door.

welded in position. The frame consists of angle iron, welded up and fitted inside with angle plates fitting round the end of the bricks.

In all the illustrations the welds have been chalked to throw them up; in practice they are quite unobtrusive.

London County Council Tramways.

The District Auditor's report on the accounts of the L.C.C. Tramways Department for 1920-21 was presented to the Council on Tuesday. The total income on revenue account was £4 904 427, and the total working expenses were £4 623 654, showing a surplus of £280 773; deducting the net cost of renewals (£215 639), the credit balance was £65 134. After providing for debt charges (£590 665), income tax (£125 000), interest on overdrafts (£23 322), and other smaller charges, the deficiency to be met out of the special county rate was £590 579. There was an increase during the year in revenue receipts of £608 581, attributable, to the extent of £600 965, to larger passenger traffic receipts. On the other hand, the expenditure showed an increase of £942 755 over 1919-20. Since the inception of the undertaking in 1897, the net contribution out of the rates to meet the deficiency has been £315 802.

Commenting upon the sanction of the Treasury to the transfer of one-half the cost of renewals of trackwork from revenue to capital to be treated as repayable within twelve years, and the repayment of outstanding debt charges on the basis of a 3½ per cent. cumulative annuity system, instead of on the instalment system, the auditor states: "There is something to be said in favour of the repayment of loans on the annuity system in the case of a new trading concern by reason of its lighter charges on the earlier revenues, which facilitate the creation of a reserve; but when, as in the present case, the undertaking has reached a definite stage of maturity, it means the postponement of charges upon the revenue to future years. This arrangement, together with the transfer of half the cost of renewals to capital account, will be particularly burdensome in view of the fact that the renewals and reserve funds have now disappeared, with the result that the revenue will be saddled not only with these postponed charges, but also with the additional debt liability arising from fresh capital outlay."

Harland and Wolff, Limited, have placed orders for electrical equipment to the amount of over £32 000 with A. Chaplin & Co. in connection with the new site at North Woolwich yard. This includes two 3-motor 20 ton cranes, five 3-motor 10 ton cranes, one 4-motor overhead travelling crane, four 3-motor 3 ton slewing mono-rail cranes, and the necessary runs of longitudinal conductor. The two 20 tonners will cost £5 536 16s., the five 10 tonners £11 792, the 4-motor overhead 10 tonner £4 200, and the four 3-motor slewing cranes £7 324.

Electricity Districts.

A scheme prepared by Blackburn and Preston Corporations for the supply of electricity in a portion of the MID-LANCASHIRE ELECTRICITY DISTRICT is to be submitted to the Electricity Commissioners. The area extends from Fleetwood to the industrial area of East Lancashire. It is suggested that capital power stations be erected at Blackburn, Preston, Burnley and Rawtenstall, with "peak load" stations at Blackpool, Burnley, Accrington and Nelson, and distributing stations at Fleetwood and St. Anne's. At the outset the stations at Preston, Blackburn and Burnley would be linked up through Accrington, the cables to be laid before 1926, after which extensions in other towns will be carried out. The proposed authority will consist of representatives of the local authorities concerned. The scheme provides that during the years 1922-31 existing stations, except those at Blackburn and Rawtenstall, are to be gradually closed down, and normal supplies will be available from the large stations at Blackburn, Preston and Burnley. The capacity of the Blackburn plant is 20 000 kW, but this will be extended to 30 000 kW; Preston will have 20 000 kW, to be extended to 40 000 kW.; and Burnley 20 000 kW, to be extended to 30 000 kW. It is proposed that Preston should be in a position to supply electricity not later than 1924. An estimated saving of £95 622 per annum would be effected by the scheme.

EAST SCOTLAND ELECTRICITY DISTRICT.

Tyneside Tramway Systems.

Now that important tramway developments and extensions are to be carried out between Newcastle and Gateshead, the "Newcastle Chronicle" urges the ADVANTAGES TO BE GAINED BY AMALGAMATION of at least some of the Tyneside tramway companies.

Under existing conditions the tramway systems in the district are owned by the following authorities:—Newcastle Corporation Tramways, Tyneside Tramways & Tramroads Company, Ltd., and Tynemouth & District Electric Traction Company, Ltd., on the north side; Gateshead & District Tramways Company, Jarrow & District Electric Traction Company, Ltd., and South Shields Corporation Tramways on the south side.

On the north side the three tramway systems are adjacent, and through running exists to a certain extent between the Newcastle Corporation Tramways and the Tyneside Tramways & Tramroads Company, Ltd. Through running is not, however, possible at present with the Tynemouth & District Electric Traction Company, as that company has a narrow-gauge line.

On the south side, although the South Shields Corporation Tramways and the Jarrow & District Electric Traction Company are adjacent, there is at the moment no through running, although the Ministry of Transport has now proposed the provision of this through service. Between the Gateshead tramways terminus at Heworth and Jarrow—a distance of about four miles—no intercommunication exists.

The case for amalgamation therefore seems pretty strong.

Electricity for Domesticity.

Referring to our editorial note in THE ELECTRICIAN of March 10 on the subject of the electrical industry and exhibitions, Mr. F. M. Spry, of the Cardiff Electricity Department, suggests that a better slogan than "Electricity in the Home" would be "Electricity for Domesticity." He thinks that the latter phrase is more euphonious, if not more apt.

Edinburgh Tramway Inquiry.

The inquiry by Sir William Marwood and Colonel Pringle, of the Ministry of Transport, into the vexed question of the SYSTEM OF TRACTION TO BE ADOPTED FOR PRINCE'S-STREET, Edinburgh, was opened on Wednesday of last week and concluded on Saturday. The Corporation, by a resolution passed some weeks ago, are committed to the erection of centre poles, and evidence in favour of this system included that of Mr. R. S. Pilcher, Edinburgh tramway manager, Chief Constable Ross, Superintendent A. Bassom, Mr. Alfred Baker, general manager of Birmingham tramways; Mr. Dalrymple, general manager of Glasgow tramways. Those in favour of the conduit system included Councillor Guest, on behalf of the Scottish Commercial Motor Users' Association; Councillor Thomson, general manager of the Scottish Motor Traction Company; Mr. A. R. Hoare, civil engineer, of Westminster, London, and Lord Salveson, chairman of the Citizens' Protection Committee.

Brighton Tramways Inquiry.

The report of the Tramways Inquiry Sub-Committee, appointed to consider various points regarding BRIGHTON tramways raised at recent meetings of the Council, completely vindicates the management of the undertaking, and the few recommendations made should, if carried out, help to put the undertaking in a better financial position. The committee find that the price charged to the undertaking for electricity supplied is in excess of that charged to other power users, and recommend that the Lighting Committee be requested to consider a reduction as from the 1st inst. They also recommend that the cost of repairs of the road surface between the two sets of rails beyond the distance of 18 in. from the rails be charged to the district fund in exoneration of the tramways undertaking, and that for the future, until the financial position of the undertaking is greatly improved, all surplus income arising in any year should be applied to the reserve and renewals fund, and no part in relief of rates, and that after the accident reserve fund has reached £10 000 no further sums be transferred thereto from revenue.

Kingston-on-Thames Electrical Exhibition.

A comprehensive exhibition of ELECTRICAL LABOUR-AID APPLIANCES is being held under the ægis of Kingston Corporation at the Baths Hall, Wood-street, Kingston, this week, and will remain open until 10 p.m. to-morrow (Saturday). Although the show is dwarfed by comparison with that at Olympia, it has the advantage that visitors especially interested in electrical appliances can see everything necessary without the trouble of searching for the stands. An orchestra and an abundant supply of refreshments add to the amenities of the exhibition, which was well attended on Monday, the opening day, in spite of the weather. There was plenty of B.E.D.A. literature in evidence, and Mr. J. W. Beauchamp himself attended to give the show a good send-off, and moved a vote of thanks to the Mayor (Dr. W. E. St. Lawrence Finny), who performed the opening ceremony.

The MAYOR expressed his pleasure in officiating, and referred to the progress that had been made by the town in general and by the Electricity Department in particular. The latter, thanks to the technical skill and business acumen of Mr. T. A. Kingham (the borough electrical engineer) and his staff, had now been placed on a sound financial basis, instead of being a source of loss, as it had been in the past, and he trusted that it would become a still more valuable asset to the ratepayers.

What is to be Seen.

A detailed list of the exhibits would perhaps be superfluous, as inevitably the goods shown are largely the same as those to be seen at other electrical exhibitions. The stands include those of the General Electric Company, who show heaters, cookers, irons, alabaster bowl fittings, and the "Time Saver" washing machine; the Sun Electrical Company, suction cleaners, washers and wringers, table lamps, bowl fittings, &c.; W. H. Gaze & Sons, lustre and candle fittings, radiators, &c., and a fine collection of silk shades; Thames Electric Company, "Eureka" cleaners, table lamps, shades, &c.; and the British Thomson-Houston Company, floodlights, coloured lighting for shop windows, which eliminate glare in the customers' eyes, theatre lamps with wheels, holding various coloured films, which are easily and quickly brought before the light, and an interesting exhibit of daylight lighting, produced by a glass rectifying screen, and contrasted with the ordinary carbon and gasfilled lamps. Geo. Nobbs, Ltd., show "Genii" geysers, coil boilers, cooking ranges, and the "Rayvac" cleaner; Bentall's, of Kingston, "Universal" cookers, irons, coffee pots, hot plates, &c., and some very attractive alabaster table lamps; the Metropolitan-Vickers Electrical Company electroliers with candle fittings, artistic silk shades, an automatic cooker, which can be set to work by an alarm clock at a pre-determined time in the owner's absence. A new Metropolitan-Vickers' speciality is a 1 kW or 2 kW electric fire, which roasts or boils and also gives a good floor heat. The Foster Engineering Company exhibit the "Universal" electric washer, radiators, and table lamps with attractive silk shades; G. W. Jones & Company (Kingston), table and hanging lamps, also with silk shades, and an assortment of kettles, radiators, irons, &c.; the Hotpoint Electric Appliances Company, radiators, cookers, immersion heaters, &c.; the Ridgway Storage Battery Company, "Hart" portable cells, ignition batteries, batteries for wireless h.t. circuits, cell inspection lamp outfits; and Brame's, electro-platers, of Kingston, have interesting specimens of their goods on view, and give continual demonstrations of their work.

Demonstrations of electric cooking and of the use of electric washers and suction cleaners are also given frequently, and visitors are invited to complete their education in regard to the advantages of electricity in the home by visiting the Corporation's electricity showrooms in Downhall-road.

Industrial Films.

Through the kind permission of Mr. Catterson-Smith, chief electrical lecturer, the students and staff of the engineering faculty of FINSBURY TECHNICAL COLLEGE have again been able to enjoy the advantage of industrial films loaned by the British Thomson-Houston Company.

The first film exhibited showed the application of electricity in the iron ore mines and in the calcining operations preceding the smelting of the ore. The drilling of holes in the face of the ore for explosives was shown, the collecting of the ore and the taking of the tubs to the station by accumulator tractors, the hauling of the ore to the surface by mining locomotives, and the taking of it from the surface into hoppers by elevators, and hence by way of the charging cars into kilns to be calcined. The various operations are electrically controlled, and this reduces the manual labour to a minimum. The film also showed the electric traction work, the lighting of the mines, the power station, the chemical laboratories, and several electrically driven accessories of the kilns.

The second film, on "Electricity in Steel Works," dealt with the manufacture of steel from the raw material to the finished product, and the processes involved in making steel wire and plates. It included excellent views of the furnace, the pouring of the metal, the soaking pits, the cogging, and rod mills in operation.

The ROYAL SOCIETY OF ARTS has bought the freehold of its Society's house in John-street, Adelphi, London. The purchase has been made possible by the gift of £30 000 from an anonymous donor, which with other subscriptions has brought the total amount subscribed to £42 000, out of the £50 000 appealed for. It is hoped that the entire sum will be secured at an early date.

Parliamentary Intelligence.

Electricity (Supply) Bill.

The House of Lords commenced the consideration of the committee stage of this Bill on Tuesday. After a motion to refer the Bill to a Select Committee had been defeated,

Lord ASKWITH moved an amendment to prevent local authorities from entering into the various monetary transactions set forth in Clause 5. If those electricity schemes were so good as was represented, let private companies take them up and if private companies did not consider them good, why should the risk be put upon the already overburdened rates?

Lord MONK BRETTON said the Bill would break down if the amendment were accepted. The Bill had been considered and agreed to by all parties in the London County Council, but it was absolutely essential that an amendment of this kind should be put on one side if the County Council were to be free to transfer to a joint electricity authority the powers it had in regard to the purchase of electricity undertakings. Lord Bessborough had an amendment on the paper limiting the charge on the rates to 1d. in the pound. He was authorised, on behalf of the London County Council, to say that they were willing to accept that limitation, though it ought to be made clear that the County Council had no idea of spending anything like that amount from the rates in connection with this Bill.

The amendment, which was opposed by Viscounts Haldane and Peel, was negatived.

An amendment by the EARL OF BESSBOROUGH, providing that the council of a county district to which the clause was to apply should have a population of not less than 50 000, was agreed to, as was another amendment limiting the annual liability to the proceeds of a rate of 1d. in the pound in the case of a local authority which is not an authorised undertaker. In the case of an authorised undertaker the liability will be limited to the estimated annual amount of capital charges of which it would be relieved by reason of taking a supply in bulk from the joint electricity authority, such estimated amount to be determined by the Electricity Commissioners.

A new clause, moved by the Earl of Bessborough, defining the power of joint electricity authorities to lease undertakings to authorised undertakers and *vice versa*, was accepted, and Clause 9 was added to the Bill.

The debate was adjourned.

Glasgow Tramways Provisional Order.

During the week Lord Oranmore and Browne, K.P. (chairman), Lord Meston, Sir Henry Craik, M.P., and Mr. J. A. M. Macdonald, M.P., sat as Commissioners for considering a series of Provisional Orders, including those of Glasgow Corporation and Ayr Burgh, for tramway and omnibus powers.

Mr. MACMILLAN, K.C. (for Glasgow Corporation), explained that Part II. of the Order related to tramways, tramroads, street works and omnibuses. The tramway system of Glasgow was a singularly successful undertaking. It had 200 miles of single track, of which 150 miles were in the city and 50 were in the three counties surrounding Glasgow or passed through burghs in these counties. The revenue last year was £2 408 094, and the number of passengers carried was over 447 million. The capital expenditure upon the system up to May, 1921, had been £4 054 892, and the remarkable achievement was attained in 1917 of paying off the entire debt on the system by sinking fund. At present the indebtedness of the Tramways Department was £126 000, a remarkably small sum for so very large an undertaking. The department now asked for authority to construct certain additional tramways, and in regard to these there was no opposition. The matter which would perhaps provoke controversy was contained in Clause 12 and the following clauses, which asked power to provide and run omnibuses. It was originally proposed to run omnibuses on thirteen routes, but five of these had been dropped. The sanctioning of omnibus services had become a matter of common form in England, but in Scotland hitherto, beyond certain limited powers to run omnibuses within municipal boundaries, authority had not yet been conferred on any municipality to run omnibuses outside their boundaries. In a tramway undertaking such as that of Glasgow, which had its radii extending in all directions and concentrating in the centre of the city, there was necessarily territory which was really in a sense suburban, largely peopled by families the heads of which carried on business in Glasgow, and who at the close of their day's work went out to the surrounding districts. Many of these districts were places to which in the course of time the Corporation would extend their tramways. At present tramway construction was almost prohibitive in cost, and the proposal was that instead of tramway construction various routes should be authorised on which by the cheaper method of omnibuses a service would be run to link up the different portions of the tramway system and to act as feeders to the tramways.

After hearing evidence (including that of Mr. JAMES DALRYMPLE, tramways general manager), for the Order and for the opponents, the Commissioners gave their decision. Of the eight routes for which powers were sought, the Corporation abandoned that of Dalmuir to Balloch Park, while the Commissioners found the preamble not proved in the case of the following routes:—Burnside to Eastwood Toll, Eastwood Toll to Newton Mearns, Millerston to Mollinsburn, Clarkston to Eaglesham, and Kilbowie to Canniesburn. They found the preamble proved as regards the general powers, and, in connection with the manufacture of omnibuses, they favoured the insertion of the model clause, which prohibits the manufacture of omnibuses by corporations. The general powers to run 'buses within a ten miles' limit of the city boundary are made conditional upon the

consent of the local authorities and the Ministry of Transport, with the right of appeal to the latter against the refusal of the local authorities. The amount for the purchase of omnibuses is not to exceed £50 000. The preamble as regards routes Burnside to Mount Florida and Pollokshaws (West) to Paisley were found proved.

Worthing Corporation Bill.

Part IV. of this Bill, which enables Worthing Corporation to extend its electricity supply area to Durrington, was considered by a Select Committee of the House of Commons last week.

Mr. Jeeves, K.C., for the promoters, stated that the Corporation had been approached by people living in Durrington to give them a supply of electricity. Their electricity undertaking was established in 1903, and the capital amounted to £120 000, of which sum only £69 000 was now outstanding. In 1903 they had 189 consumers, and in 1922 twelve times that number. The units supplied had grown to 818 000, and the gross revenue from £5 000 to £20 000. Since the end of December last they had increased the number of consumers by 235, and to-day the undertaking had 2 191 consumers. Of thirteen towns in the South of England, there were only three that had a less charge than 8d. a unit, and not one of them had a lower maximum than Worthing, and all but two had a higher maximum. The Ministry of Transport made no observations on the extension of the area, but they thought that the Corporation should have some obligations with regard to streets and the laying of mains. There was one petition against the Bill, viz., that of the Worthing Gas Company. It was somewhat pitiful to find a gas company objecting to a supply of electricity. They had heard a lot about it in the earlier days, but he submitted that they had not been interfered with, and that they had had an era of prosperity which had gone on until the war, when it was interfered with, as was everyone else. He contended that if the Corporation had been able to carry on during the war without increasing the charges they would be able to do so in the future.

Mr. Geo. Porter, borough electrical engineer, gave technical and financial particulars of the electricity undertaking. He was of opinion that it was desirable that the Corporation should have power to supply electricity in Durrington, a district in which there was considerable development. During the last two or three years the Corporation had had a number of applications for electricity from the parish, and one gentleman, who was anxious to form a company, wanted to take a supply in bulk for an estate, and it was estimated that the amount required would be 10 000 units. There had also been an application for supply for the Offington Garden City, where it was anticipated there would be about 500 good-class residences.

Mr. Wm. Cash, chairman of the local gas company, gave evidence in opposition and asked for protective clauses, as the company were large ratepayers.

Ultimately the Committee decided that the clauses in the Bill should stand, and the clauses suggested by the company were rejected. The other clauses were then dealt with, and one, conferring power to supply electricity in bulk outside the area of supply, was withdrawn.

Doncaster Corporation Bill.

The consideration of this Bill has been concluded by a Select Committee of the House of Lords. The provisions include light railway extensions, the running of omnibuses by the Corporation within and outside the borough, and further powers with reference to the electricity undertaking.

Mr. W. J. Jeeves, K.C. (for the Corporation), said that in the tramway undertaking the Corporation had something in which their responsibility to outside districts was recognised. The Corporation commenced to establish the tramway undertaking by obtaining an Order in 1899 for ten miles, half of which were in the borough and half outside it. From the outset the Corporation were given power to provide not merely for themselves but for the outside districts. Since 1911 various powers for the construction of tramways had been obtained and a large proportion of the cost had been incurred for outside districts. The Corporation felt that if they were to continue to operate their tramways successfully those powers to run motor omnibuses were essential. The motor 'buses were needed for workmen going to and from work beyond the present tramway termini.

After evidence in support of the Bill had been given, witnesses were heard on behalf of the opponents, Underwood, Ltd., and Automobiles Services, Ltd., which provide omnibus services in the district.

The Bill has now been reported for third reading.

The Post Office Tube Railway.

In reply to Mr. Perring (House of Commons, March 29), Mr Pease stated that the sum provided under the Post Office (London) Railway Act, 1913, for constructing the Post Office tube from Spring-street, Paddington, to Aldgate was £1 100 000. The account up to the end of March, 1921, had just been issued (Command Paper 13). The sum expended to date was approximately £1 127 000. He could not estimate the cost of the work remaining to be done; it would, of course, be very largely in excess of the original estimate. It was not anticipated that the construction of the railway would effect any appreciable saving. The intention was to expedite the transmission of the mails and relieve the congestion of street traffic.

Wireless Telephony.

In reply to Sir D. Newton, who asked the Postmaster-General (House of Commons, April 3) if he would sanction and promote the daily broadcasting, by established and suitably equipped radio stations, of wireless telephone messages likely to prove of value to trade and industry in this country or being of general public interest, Mr. Kellaway said he was entirely sympathetic towards this proposal. The whole question was being referred to the Imperial Communications Committee in order that the views of the other departments concerned might be obtained as early as possible.

Imperial Cable Rates.

Replying to a question by Mr. Hurd, the Postmaster-General (Mr. F. G. Kellaway) stated in the House of Commons on Tuesday that specially low rates are already given on the "Imperial" cable service for non-urgent traffic. The "Imperial" is the only cable route providing a deferred Press service to Canada at 2½d. a word, and to Australia and New Zealand at 4½d.; a deferred service for general traffic to Canada at 4½d. a word; and a week-end service to Australia and New Zealand at quarter rates. A large amount of traffic is sent by these cheap rate services, but it is held over whenever necessary in favour of full-rate traffic.

Orkney Islands Cable.

In the House of Commons on March 28, in reply to Sir Malcolm Smith, Mr. Kellaway stated that the two submarine cables between Kirkwall and the North Isles of the Orkneys became faulty on Jan. 31 and Feb. 6 respectively. The Post Office cable ships were at present employed on repairs to important cross-Channel cables. Every effort would be made to restore communication with the North Isles at the earliest possible date. He could not at present name a date when the Orkney cables could be repaired.

East of Scotland Electricity District.

In reply to Mr. W. Graham in the House of Commons on March 28, Mr. Neal said that the Electricity Commissioners had provisionally determined an electricity district for the East of Scotland. The Musselburgh and District Electric Light and Traction Company had applied to the Commissioners for a Special Order extending their area of supply. The Corporation of Edinburgh were opposing the grant of this Order, and would have an opportunity of stating their case before the Commissioners.

Wireless Service Between India and England.

In reply to Mr. Hurd (House of Commons, March 28), Earl Winterton said he understood that an Indian application had been made to the Indian Government for a licence to work a direct wireless service between India and England, but that the Government of India did not consider it desirable at this early stage to disclose the name of the applicant. No licence to private persons or companies for wireless communications between India and England was being granted at present.

Railway Electrification at Midland Coalfields.

In reply to Major Kelley (House of Commons, March 29), who asked whether any preliminary survey had been made for the electrification of railways in the coalfields of South Yorkshire, Nottinghamshire and Derbyshire, and whether any railway route in these areas was to be electrified, Mr. Neal stated that he was informed that the railway companies concerned were not at present considering any project for the electrification of any of their lines in the area referred to.

Yorkshire Electric Power Bill.

The Standing Orders Committee of the House of Lords have granted the application of the Yorkshire Electric Power Company for leave to introduce into this Bill an additional provision to authorise an increase of the capital and borrowing powers, and to authorise them to raise additional moneys by the creation and issue of ordinary and preference shares, and by borrowing, or by the creation and issue of debenture stock, &c.

Minister of Transport.

In reply to Major Kelly (House of Commons, March 27), Mr Chamberlain said it would be necessary to appoint another Minister of Transport, though the post would carry no salary.

Metallurgical Aspect of Electric Welding.

A general meeting of members of the Sheffield Society of Engineers and Metallurgists was held in Sheffield last Friday, when Mr. J. H. Paterson, of Newcastle-on-Tyne, lectured on "The Metallurgical Aspect of Electric Welding."

To a large extent the lecture was devoted to a consideration of nitrogen and oxygen in steel. Mr. Paterson referred to the various processes of welding, and laid down the assertion that the correct current-strength at which to weld was the highest possible —certainly the higher the current-strength the more perfect would be the weld. The percentage of oxygen varied according to the strength existing in globules in the metal, and, though generally nitrogen had a bad effect on the steel, it had at the same time a tendency to strengthen. His own experiments at Newcastle had been conducted with the help of a specially prepared iron box, with glass front and four openings for experiments, and he had found that by this means he could obtain any strength he wished, often without the least trace of foreign or objectionable matter. It was possible even then to find occasionally that nitrogen could not be wholly excluded, but at the most it was no more than 0·025 per cent., so that it was practically negligible.

The Right Hon. F. Huth Jackson, a director of the London & South-Western Railway, has left unsettled property of the gross value of £169 907, with net personalty £101 677.

Legal Intelligence.

Dumfries Burgh v. Dumfries Electricity Supply Company.

Lord MORISON has closed the pleas in this action, brought by the Provost, Magistrates and Councillors of the Royal Burgh of Dumfries against the Dumfries Electricity Supply Company for a declaration that the company is not entitled to charge any private consumer for energy supplied to him more than 7d. per unit for lighting and 3d. per unit for power and heating; that the company is not entitled to apply to the Ministry of Transport for an Order under the Statutory Undertakings (Temporary Increase of Charges) Act, 1918, for a modification of the statutory provisions regulating the charges to be made by them for electricity supplied by them under the Dumfries Electric Lighting Order, 1899, and in particular that the company is not entitled to apply to the Ministry of Transport for an Order authorising them to charge any consumer 1s. per unit of energy supplied. The Council obtained a Provisional Order in 1899 to supply electrical energy within the burgh, and the following rates per quarter are permissible under the Order—for any amount up to 20 units 13s. 4d., and for each unit over 20 units 8d. The Order was first transferred to the India Rubber, Gutta Percha and Telegraph Works Company by an agreement approved by the Board of Trade on Jan. 16, 1906, but the India Rubber Company were entitled to sell, assign, or otherwise dispose of the undertaking, or any part thereof, and to transfer their powers, duties and liabilities. By a collateral agreement between the Council and the India Rubber Company, dated Dec. 5, 1905, the maximum price to be charged by the company to private consumers was fixed at 7d. per unit for lighting and 3d. for power and heating. Subsequently the India Rubber Company transferred the undertaking to defendant company, the capital of which was almost entirely held by the India Rubber Company. Notwithstanding the terms of the collateral agreement, the company has applied to the Ministry of Transport for an Order authorising them to charge any consumer 1s. per unit of energy supplied, and it is asked that the company should be interdicted from charging any consumer rates per unit in excess of those stipulated in the agreement and from applying to the Ministry of Transport to impose any increased charges in excess of those stipulated in the collateral agreement, and in any event from increasing the maximum charges fixed by the Provisional Order.

Defendant company admits the transfer of the Order, and that it has made representations to the Ministry of Transport on the subject of charges; it pleads that Sec. 71 of the Order of 1899 entitles it to the benefits of any general Act relating to electricity or to the supply of or price to be charged for energy which might be passed after the commencement of the Order. The company is the undertaker under the Order, and is, therefore, entitled to the benefits conferred by the Statutory Undertakings (Temporary Increase of Charges) Act, 1918.

Serious Fraud Charges at Leeds.

At the West Riding Assizes (Leeds) on Saturday, WILLIAM ARTHUR DAVIS, a tinsmith, of Wortley, was found guilty of obtaining investments for the Leeds Battery Company, of which he said he was proprietor, when he had not actually purchased the company. The police statement was to the effect that Davis first obtained £400 to start a business at Ilford, but never gave any of the money back. He got a staff of fifty-five, from most of whom he obtained money. When the business closed down he became a manager at Chadwick Heath, but he did not pay in the money he received from clients, and the firm went into liquidation. He came to Leeds in February, 1919, and started in the name of W. A. Davis. As a result of advertising he obtained £500 from three persons. In April of the same year he obtained other premises and traded as W. A. Davis & Company. He advertised for capital, and obtained £1 550 from six persons. In November, 1919, the company at Coronation-street was registered as the Leeds Alliance Electric Manufacturing Company, and he then obtained £2 650 from ten other people. During the early part of May, 1920, he sold the firm of W. A. Davis (Coronation-street) to the Leeds Alliance Company (although it had been previously registered as part of the company) for £2 000 in shares and £1 000 in cash, and shortly after he made a return that he and his wife were the only shareholders, except a Mr. Morris, who held 200. This Mr. Morris had previously invested £600, and had issued a writ against Davis. Prisoner gave back £400, and promised £200 in shares to Morris. Continuing to advertise, Davis obtained £2 415 from six other investors, and in December, 1920, he went to Basinghall-street, Leeds, and obtained goods from London firms to the value of £2 126. Before that he had made a false return, and secured an overdraft from the National and Provincial Bank for £515. The total amount involved since prisoner came to Leeds, and which had not been returned, was £10 150.

The judge, in sentencing the prisoner to four years' penal servitude, said Davis was a thorough scoundrel.

Wiring Contract Dispute.

At Marylebone County Court on Tuesday Henry Edward Childs, electrician, sued Philip Greenberg, for £49 10s., the cost of goods sold and work done.

PLAINTIFF'S case was that defendant asked him to do certain wiring at his house, this including wiring for lighting and heating purposes. The work was completed on Nov. 4 last, and defendant paid £10 on account. There were several items for extra work, such as erecting pendents, &c. For the wiring steel tubes were used. Plaintiff said he agreed to put the steel tubing down the walls, but not to chase it to the walls. He had heard nothing of not having done the work in accordance with the requirements of the local electrical supply company.

DEFENDANT gave evidence, and said his complaint was that the work had not been carried out according to contract, adding that plaintiff promised to put the tubing in the walls and ceilings so that it would not show. Otherwise it was to be chased, so as to be invisible.

JUDGE SCULLY held that defendant was right as to the method of erecting the steel tubing. It seemed to him that it was the usual way of carrying out such work. He would not say that the manner in which plaintiff put in the tubing was unsafe, but in his opinion it was not according to contract. He gave judgment for plaintiff for £35 5s., the amount paid into court, with costs up to the time of payment in.

Black Smoke Nuisance.

At West Ham Police Court on the 29th ult., the Charing Cross, West End and City Electricity Supply Company were summoned at the instance of Poplar Borough Council for permitting black smoke to issue from their electricity works at Marshgate-lane, Stratford, in such quantity as to be a nuisance. For the Poplar Council, it was said that when the wind was in a particular direction the company's smoke drifted into Poplar.

Mr. F. A. S. STERN (for the company) urged that they used 80 000 tons of coal a year. Latterly they had been receiving all sorts and conditions of coal, and at times it had been difficult to avoid a nuisance.

Mr. RATCLIFFE COUSINS made a formal order to abate the nuisance forthwith, and ordered the company to pay £5 5s. costs.

The Engineering Lock-Out.

Though at the moment of going to press the lock-out of the members of the Amalgamated Engineering Union does not seem to be any nearer settlement, there are features which make for optimism. As a result of the Prime Minister's intervention, the delegates of the forty-seven unions, which were expected to support the A.E.U., have accepted the proposals for the resumption of negotiations as arranged between the National Joint Labour Council and Sir Allen Smith, and discussions have been resumed.

The leaders of the A.E.U., however, are stated to have said that they would fight on to the bitter end, though it is to be hoped that more sober counsels will prevail.

Cobalt Steels.

Mr. F. W. Kayser, lecturing on COBALT STEELS before the members of the Sheffield Association of Metallurgists and Metallurgical Chemists last week, gave some interesting particulars with respect to one of the most recent developments of research work in Sheffield in steel. The addition of cobalt to magnet steel, he explained, enabled magnets to be made which were less than half the weight of the magnets made of ordinary tungsten magnet steel. The credit for the discovery should not go to Japan. It was quite true that the Japanese had brought out a magnet steel containing from 20 per cent. to 35 per cent. of cobalt, but a short time before this was patented a Sheffield steel was patented containing a much less percentage of cobalt, with a high percentage of chromium, which was practically the equal of the Japanese material and less than half the price. This new steel was practically revolutionising the magneto industry and also the telephone industry. People had not previously realised to what a tremendous extent the whole shape of a magneto or a telephone depended upon the magnet steels they were using. The soul of the instrument was the permanent magnet.

Institution of Engineers, India.

In the course of his presidential address at the second annual meeting of the INSTITUTION OF ENGINEERS (INDIA), Major G. H. Willis said that the Government of India, in addition to entrusting the work on Engineering Standards for India to their Institution, was preparing to hand over that of the Electro-Technical Commission also, when the Institution had completed its third year of existence as a corporate body. In the meantime they had nominated a committee of three of the Council of the Institution—Messrs. Coubrough, Cochran and Hindley—to deal with the subject.

Continuing, Major Willis stated that one great corporation—he was not at liberty to give names—employing many engineers, had decided to insist on all its junior engineers qualifying for Associate membership of the Institution either by passing the Institution examinations for Associate membership or such other examinations as the Institution might accept. These were only beginnings in the vast sphere of usefulness to India and to their profession, which they, as an Institution, hoped to fill.

The first volume of the Proceedings of the Institution, recently to hand, opens with an account of the inaugural ceremony performed by Lord Chelmsford on February 23, 1921. The opening address by Sir Rajendra Nath Mookerjee, the first president, is then given, and is followed by the first annual report. The succeeding pages are devoted to the papers read during the session. The subjects dealt with included "Light Railways," by Mr. F. G. Royal-Dawson; "Electro-chemical Industries," by Mr. L. L. Fermor; "Driving Belts," by Mr. A. T. Weston; and "The Patent System," by Mr. V. Lough.

Electricity Supply.

A proposal that the dual administration of the Blackpool electricity and tramways undertakings shall cease, and that two departments be set up, is to be placed before the General Purposes Committee at a special meeting.

The Electricity Committee recommend Dundee Town Council to consider favourably a proposal to combine the Grampian hydro-electric scheme with the municipal electricity undertaking, provided financial terms favourable to the city can be obtained and the municipal interests are otherwise safeguarded.

Belfast Electricity Committee has made several recommendations with regard to the supply of current for lighting and power, and these will be considered this week by the Corporation. The recommendations include a reduction of 1d. per unit for lighting and power purposes, and a larger reduction for big consumers, picture houses, &c.

A special meeting of East Grinstead Urban Council was held last week to consider the estimates for the first three years of the proposed electrical undertaking. For the first year a deficit of £643 was estimated, for the second year £215, and for the third year a profit of £138. An amendment to take a canvass of the ratepayers before proceeding further with the scheme was rejected, and the Council accepted tenders totalling £17 186.

Ogmore and Garw Urban Council are applying to the Electricity Commissioners for a Special Order authorising the Council to provide and supply electricity in their urban district, to purchase electricity from the South Wales Electrical Power Distribution Company, Cory Brothers & Company, the Ogmore Valley Electric Light & Power Supply Company, or other body or person. Any objections must be sent to the Electricity Commission by May 1.

The Ministry of Health have sanctioned a loan of £517 for ten years, and another of £2 593 for twenty-five years, in respect of electric lighting on the Promenade at Morecambe. The Ministry have authorised the removal of portions of the Lancaster and District Tramways Company's rails within the borough of Morecambe, thus completing the legal formula in connection with this transaction. The motor firms who were granted powers to run services subject to certain conditions, have appealed to the Ministry of Transport against these conditions.

The Visiting Committee of the Dundee Town Council are making inquiries into the working of the various municipal departments. A report issued on the Electricity Department deals exhaustively with the various branches, and concludes: "The Committee was much impressed by the whole organisation, evidently giving the Engineer an oversight and grip throughout, and yet without the useless redundancies of organisation that are in some modern systems. They were also very pleased to observe the good spirit and the conspicuous interest in their work shown by the staff throughout. They spoke as if they and the undertaking were one. The custom observed of having a monthly meeting of the staff for discussion of methods and suggestions for improvement is typical."

New Schemes and Mains Extensions.

Ashford Urban Council has decided to obtain a Special Order to supply electricity in the area.

Sidmouth Urban Council has decided to apply for a loan of £12 000 for carrying out an electric light scheme.

Plymouth Electricity and Street Lighting Authority have decided to carry out cable extensions in the district amounting to nearly £3 000.

Reigate Town Council has applied to the Electricity Commissioners for a loan of £48 100 for the installation of three new 350 kW Diesel sets, &c., at the electricity works.

Leyton Urban District Council has received sanction to borrow £27 500 in respect of the application for a loan of £34 454 for the erection of the electricity sub-station at Waterloo-road.

Ilford Urban Council has applied for a loan of £6 609 for excess expenses in respect of the Grove-road sub-station and plant, £2 918 for sub-station extension, coal elevator, oil fuel plant, &c., and £10 000 for mains and house services.

Truro Town Council has received from the Electricity Commissioners approval of a scheme for obtaining a supply of electricity in bulk from the Cornwall Electric Power Company. The Council will now continue negotiations with the company for a supply of current.

Hawarden Rural Council has applied for a Special Order to supply electricity in the parishes of East Saltney, Higher Kinnerton, Hope, Llanfynydd, Sealand and Tryddyn, and part of the parish of Hawarden, and to authorise the Council to purchase electricity in bulk from the North Wales Power & Traction Company, Ltd.

Without prejudice to any future action they may take, Chesterfield Electricity Committee have approved the revised representation of Sheffield Corporation's scheme for the formation of a North-East Midlands electricity district. Under this revised scheme Sheffield and Rotherham (jointly) have twelve members, Chesterfield two, Doncaster two, and Worksop one.

A scheme of electricity extensions, estimated at £105 000, has been drawn up by Mr. Christie, the Brighton borough electrical engineer and manager, and is at present under the consideration of the Lighting Committee. In the meantime application is to be made to the Electricity Commissioners for sanction to a loan of £42 000 to cover the cost of a new 600 kW turbo-alternator and a 400 kW d.c. turbo-generator, for which tenders are being invited.

At a public meeting on March 28 of Bideford ratepayers a resolution was carried in favour of the electric lighting scheme prepared by the newly-formed Electric Light Company. The engineer, Mr. J. N. A. Houblon, emphasised the importance, if possible, of the town providing sufficient capital to enable the complete scheme, involving £25 000, to be carried out, as they would then be in a position to supply not only Northam, but also to give a supply to Torrington. The system of overhead wiring is being adopted.

Alteration of Charges.

Maidstone Town Council has decided to lower the charge for electricity by ½d. per unit as from April 1.

Blackpool Electricity Committee have decided to reduce the price of electricity from 50 to 40 per cent. over pre-war rates.

The price of electricity at Bury is to be reduced by 20 per cent. for lighting and tramway purposes, and 30 per cent. for power.

Barking Urban Council has reduced the charge for electricity for lighting by 25 per cent. to 8d. per unit, and by 27½ per cent. for power, cooking, and other purposes.

Electricity charges at Horsham have been reduced from 8d. to 7½d. per unit for lighting purposes, and a reduction of ¼d. per unit has been made on all power accounts, including contracts which exceed 100 units per quarter.

The Electricity Commissioners have made an order that the maximum price to be charged by Ammanford Urban Council shall be 15s. per unit up to 15 units, and 1s. per unit over 15 units, for the quarters ending March 31 and Dec. 31, and 10s. per unit up to 10 units, and 1s. per unit afterwards, for the quarters ending June 30 and Sept. 30.

Electric Traction.

The Minister of Transport has extended for one year from Aug. 7 next the time allowed for the completion of tramway No. 2 authorised by the Leeds Corporation Act, 1914.

One of the reasons why Southport Council has been recommended to discountenance the running of motor-'buses is that the electricity department would lose revenue by a drop in the traction load.

Burnley Tramways Committee recommend that the relaying of the track be carried out at a cost of nearly £13 000. The lines to be relaid include sections on the Rosegrove, Manchester-road, and Townley routes, whilst a double line is to be placed on the Rosehill-road section.

Owing to the recent heavy snowstorms the tramway services in many districts have been interrupted. The service between Merthyr and Dowlais was stopped on Friday night and was unable to resume until mid-day on Saturday. At Bournemouth also the service was disorganised owing to the deep drifts.

Leicester City Council have approved of a recommendation by the Tramways Committee that the Welford route be completed, and that the section be opened as early as possible. The work was authorised in 1913, and after the completion of the track and certain overhead equipment the work had to be suspended on account of the war.

Belfast tramway system shows a falling off of no fewer than 278 152 passengers in the last two weeks ending the 24th ult., as compared with the corresponding period of last year, and a decrease of £1 947 in revenue. This was largely owing to the repeated attacks by bomb and revolver on the trams, particularly those carrying workmen from the Queen's Island shipyards.

The sum of £301 000 has already been expended on the reconstruction of Cardiff tramways track, and as the fund of over a quarter of a million sterling, set apart by the department for the purpose, has been expended, it is necessary to obtain a loan of £160 000 to finish the work. The additional sum is required owing to the enhanced cost of labour and material. Although many of the men engaged in the work are of the unemployed, only £7 000 has been received from the Government, and the Department has decided to put in claims for a larger contribution.

Mr. R. L. Horsfield, the tramways manager, has been instructed to prepare a report as to the reintroduction of 1d. fares and on the introduction of special fares for children.

The Ministry of Transport held an inquiry last week into the application by Newcastle Corporation to amend the Newcastle-on-Tyne Light Railway Order by including an additional tramway. The Town Clerk stated that the proposed line is situate near the western boundary of the city, and when constructed would, in conjunction with Tramroad No. 2, now in course of construction, form a means of communication to the centre of the city for passengers from the west and south-west of the city. The length was six furlongs, and the total estimated cost of construction and of acquisition of land and buildings was £13 564. It was felt that the present necessities of the public could adequately be served by the proposed light railway, in conjunction with Tramroad No. 2, and that it might well serve to assist in the development of the Fenham district of the city. Details of the proposed construction were given by Mr. Ernest Hatton, engineer and general manager of the tramways, and Major Steele, city engineer. At the close of the inquiry the chairman, Mr. Alan D. Erskine, stated that he would report upon it to the Minister of Transport, and he hoped there would be no delay in making the Order.

Personal and Appointments.

Major-General Sir FREDERICK SYKES has joined the board of the Anglo-Argentine Tramways Company.

Mr. E. R. DUNN, electrical engineer, has been elected chairman of the committee of Ramsgate Chamber of Commerce.

Lieut. L. S. KING, from the London Electrical Engineers, has been posted to the Reserve of Officers of the Territorial Army.

Commissioned Telegraphist W. S. BLOODSWORTH has been appointed to the battle cruiser "Queen Elizabeth" from the 16th inst.

Mr. G. W. SPENCER HAWES, secretary of the Reading Electric Supply Company, Ltd., has been elected to the committee of the Reading Athenæum Club.

Councillor E. C. RANSOME has been elected president, and Mr. LLEWELYN B. ATKINSON chairman, of the British Development Association for the ensuing year.

Mr. FRANK MARSH, formerly of Curran's Cardiff Foundry & Engineering Company, has been appointed public lighting inspector by the Cardiff Electricity Committee.

Mr. W. J. WEBB, one of the representatives for Rotherhithe on the London County Council, has been appointed a member of the Electricity Committee of the County Council.

Consequent on a naval officer being put in charge of the Bermuda Wireless Station, Lieut. E. C. L. BEARCROFT has been ordered to return home to join the Chatham Division, R.M.L.I.

Mr. A. C. GORTON has retired from the firm of Gorton and Smith, electrical engineers, St. Swithen-street, Winchester, and the business will be continued by Mr. ROWLAND HERBERT SMITH.

Major G. H. WILLIS has been elected president of the Institution of Engineers (India) for the ensuing year in succession to Sir R. N. Mookerjee, who has held the post from 1920-22.

Colonel H. MACCALLUM, of the Marconi Company, has, at the request of Mr. Wm. Le Queux, president of the Reading Radio Research Society, consented to serve on the committee of the society.

Mr. B. F. KERRIDGE, formerly under-surveyor of Baldwin's collieries, and later H.M. Inspector of Mines at Newport, sailed for India last week to take up an appointment as the first Electrical Inspector under the Mines Department of the Indian Government.

Mr. JOHN BERNARD, manager of the Bolton Tramways Department, has been elected one of the employers' representatives on the National Joint Industrial Council for the Tramways Industry in succession to Mr. J. M. McElroy, the retiring manager of Manchester Tramways.

We are glad to be able to announce that Mr. ERNEST HATTON will continue in his position as engineer and general manager of Newcastle-on-Tyne Corporation tramways. Since we announced, in our issue of Feb. 24, his intention to retire in three months' time, Mr. Hatton has had further medical advice, and has received a more favourable report. The Transport and Electricity Committee have agreed to the withdrawal of his notice.

Mr. C. E. SKINNER, manager of the research department of the Westinghouse Electric & Manufacturing Company, Pittsburg, Pa., has been appointed assistant director of engineering in that company. Mr. Skinner is known throughout the electrical world for his extensive research work, especially on insulation, and his efforts in this direction have had a marked effect on the development of electrical machine design. Mr. Skinner has contributed frequently to the literature of the electrical industry, and is well known for his researches. In 1915 he was a special representative of the American Institute of Electrical Engineers, of which he is a Fellow, at the International Conference on Electrical Standards held in London, and he is now a member of the committee representing the Institute of the International Electrotechnical Commission. He was chairman of the American delegates to the Brussels meeting in 1920.

Mr. S. M. KINTNER, who is well known for his research and engineering work in the development of radio apparatus, has been appointed manager of the research department in succession to Mr. Skinner.

Business Items, &c.

The telephone number of Sir CHARLES BRIGHT & PARTNERS is now Bishopsgate 1120 (two lines).

The ALFO ELECTRICAL ENGINEERING COMPANY announce that they are closing down their branch business at Telegraph-road, Heswall.

A reduction in the price of ROYAL "EDISWAN" KINGOLITE LAMPS is announced in our advertisement columns. This reduction amounts to as much as 1s. 9d. per lamp in some cases.

Mr. H. B. TURNER has taken over the complete control of Hall & Turner, wholesale factors of electrical goods, and will be glad to receive manufacturers' and agents' price-lists for cables, switches, lamp-holders, &c., at 79, Playford-road, London, N. 4.

The A. & A. ELECTRICAL COMPANY announce that as from April 1 they have taken over the business of Spicer & Company, Ltd., 41, Red Lion-street, Clerkenwell, E.C. 1, with all cash assets and liabilities, and that they will collect all outstanding cash assets of that company and satisfy all liabilities. They have also been successful in securing the services of Mr. S. J. Levi as manager, who is joining the board of directors of their company.

GRAFTON (N.S.W.) Council have decided to equip electricity works which will be capable of subsequent working in co-operation with the Nymboida hydro-electric scheme.

Institution Notes.

Among the Papers to be read at the annual meeting of the IRON AND STEEL INSTITUTE, which is to be held on May 4 and 5 at the Institution of Civil Engineers, Great George-street, London, is one entitled "Recent Developments in Power Production," by Mr. D. Selby-Bigge.

Mr. J. A. Kuyser's Paper on "Protective Apparatus for Turbo-Alternators" will be read and discussed before the INSTITUTION OF ELECTRICAL ENGINEERS on April 27, instead of April 6, as already announced. The joint meeting with the Röntgen Society and the Electro-Therapeutic Section of the Royal Society of Medicine, previously announced for April 27, has been postponed.

A ballot for the election of members and student members of the INSTITUTE OF METALS will be held at noon on Wednesday, April 19, in connection with the twelfth annual May Lecture. This lecture is to be delivered on Wednesday, May 3, by Prof. Sir Ernest Rutherford, of Cambridge University, on "The Relation of the Elements." Membership application forms and cards of invitation to the lecture may be obtained on application to Mr. G. Shaw Scott, M.Sc., the secretary of the Institute of Metals, 36, Victoria-street, London, S.W. 1.

The opening meeting of the 1922-23 session of the British Section of the SOCIÉTÉ DES INGÉNIEURS-CIVILS DE FRANCE will be held at 5.30 p.m. on Tuesday, April 11, at the Institution of Mechanical Engineers, Storey's Gate, S.W. 1, when Mr. W. Noble Twelvetrees will deliver the presidential address, opening a discussion on "Co-operation between Engineering Institutions in France and Great Britain." Ladies will be cordially welcomed. Several well-known engineers have already announced their intention to take part in the discussion, and we are informed that members of all British engineering institutions and societies are invited to attend the meeting.

The Council of the OPTICAL SOCIETY is arranging a programme of papers dealing with motor headlights, having reference more particularly to the optical problems involved. The question of "glare" or "dazzle," and the methods proposed for overcoming it, will be considered, both from the point of view of the optician, the lamp manufacturer, and the road user. The meeting will be held at the Imperial College of Science and Technology, South Kensington, on May 11, and anyone desiring to contribute to the discussion or to exhibit models or give experimental demonstrations is requested to communicate with the honorary secretary of the Society, Mr. F. F. S. Bryson, Glass Research Association, 50, Bedford-square, W.C. 1.

Telegraph and Wireless Notes.

Direct telegraphic connection from GOTHENBURG TO PEKING *viâ* Petrograd and Irkutsk has been re-established by the Great Northern Telegraph Company.

A loud-speaking wireless telephone installation has just been completed at LAUSANNE, which will be in communication with the Eiffel Tower telephone each evening, and will be able to record communications from London, Berlin, and even America.

Sir THOMAS WATT, the South African Minister of Public Works and Posts and Telegraphs, states that the Government intends to acquire a wireless station for the purpose of establishing an adequate service with other countries of the world, and is at present considering several propositions in this connection.

Arrangements have been made by the Postmaster-General to enable telephone subscribers to BOOK TRUNK CALLS IN ADVANCE. The calls, which are effected at or about a specified hour, as desired by the subscriber, are known as "fixed time" calls, and the booking may be either for a single call or for a daily call for a minimum period of a week, including or excluding Saturdays and Sundays. The calls are number to number, not person to person calls. A single "fixed time" call should, if possible, be booked at least three hours before the time at which it is required, such as stock exchanges, corn exchanges, etc.

MARYLAND TELEPHONE EXCHANGE, which replaces the Stratford and Broadway Exchanges, was opened on Saturday. The equipment at Stratford Exchange was of an obsolete type, and there was no spare capacity, while Broadway Exchange was only of a temporary character. Accommodation is provided for approximately 2 000 subscribers and 460 junctions to other exchanges in London. Ample external cable plant exists in the neighbourhood, and the new exchange will be capable of extension to meet the needs of the district for a number of years ahead. Maryland Exchange is the twelfth new exchange to be opened in London since the Armistice.

Exhibition Notes.

The thirteenth INTERNATIONAL BUILDING TRADES EXHIBITION will be held at Olympia from the 11th to 27th inst.

A Mining and Industrial Exhibition is to be held by the Chemical, Metallurgical, and Mining Society of SOUTH AFRICA in October. Firms interested are advised to communicate with their local agents, or the secretary of the society, 100, Fox-street, Johannesburg, South Africa.

At a meeting of members of the Council of the Birmingham section of the BRITISH INDUSTRIES FAIR and the leading exhibitors on Thursday last, it was proposed that the Fair at Castle Bromwich next year be held in May instead of early March; also that there be no standardising of stands, and that the public be admitted on two days (Saturday and the second Wednesday) at a small charge, which will probably be fixed at 1s. These matters will now be dealt with officially.

Obituary.

The death has occurred of Mr. Philippe Guye, Professor of Physical Chemistry at Geneva University.

We regret to record the death, which took place on Monday, of Mr. E. A. Claremont, chairman and managing director of W. T. Glover & Company.

The death has taken place at Bournemouth of Mr. James N. Paxman, in his ninety-first year. Mr. Paxman was born at Colchester, and at the age of fifteen entered his father's engineering business. Four years later he became joint manager with Mr. C. Marriage of Catchpool & Sons' engineering and ironfounding business, and two years later he was appointed to the entire charge. In 1865 he resigned this position to commence business with C. M. and H. M. Davey at Colchester. In 1869 he patented the "Paxman" vertical boiler, and in 1878 his automatic cut-off gear, combined with a governor for effectually regulating and controlling the speed of a steam engine. The same year the Messrs. Davey retired from the business, their interest being taken over by Mr. Paxman and his partner. At the International Electric Exhibition at the Crystal Palace in 1882, Mr. Paxman's engine was retained by the jury for carrying out their experiments; they commended it for its efficient and regular performances, and awarded him a gold medal. The firm's business continued to develop, and in 1898 it was converted into a private limited company, and to-day ranks as one of the leading firms in the kingdom. Mr. Paxman was elected Mayor of Colchester for 1887-1888, and for 1897-1898. He had served as High Sheriff for the County of Essex, and was a Justice of the Peace for Colchester as well as for the county of Essex.

Social Notes.

The eleventh annual dinner of the Batti-Wallahs' Society was held at the Holborn Restaurant last Friday, with the president, Mr. Edgar S. Barralet, in the chair. After dinner an excellent musical programme was rendered, during the intervals in which the toast of "The Society" was proposed by Mr. Elmhirst, one of the half-dozen men who met together and formed the Society in 1906, and that of "The Ladies and Visitors" by Mr. W. Riggs. These toasts were replied to respectively by the President and Mr. L. C. Gamage, secretary of the G.E.C.

Past and present members of the Board of Control of the National Association of Supervising Electricians and their friends, to the number of about seventy, met at a whist drive and dinner at the Mecca Café, Ludgate Hill, London, on Saturday, March 25. During dinner Mr. R. W. Whitley, in a humorous speech, proposed the toast of "The Ladies," to which Mr. W. J. Revell responded. A musical programme, followed by an enjoyable whist drive, with Mr. A. J. Stiling acting as M.C., added to the success of the evening. Mr. T. H. Windibank, as chairman, caused much merriment with his humorous remarks when distributing the prizes, and delighted his guests with the manner in which he carried out his duties.

Trade Inquiries.

A manufacturers' agent in Vancouver desires to obtain the representation of United Kingdom manufacturers of electrically galvanised metal strip, on a commission basis, for the province of British Columbia. Particulars from the Department of Overseas Trade, 35, Old Queen-street, London, S.W. 1. (Reference No. 360.)

A manufacturers' agent in Montreal wishes to represent, on commission, United Kingdom manufacturers of electrical specialities for sale in Eastern Canada. Particulars from the Department of Overseas Trade. (Reference No. 362.)

Electrical Activities in China.

C. C. Nieh, Lu Er-kia, and other Shanghai merchants propose to organise the Yeh Chung Machine Manufacturing and Engineering Company in Shanghai, for manufacturing electric fans, electric lamps, dynamo, motors, and all other electrical goods. Its capital will be $300 000 in 3 000 shares of $1 000 each.

The Ta Tung Company, Ltd., has recently been organised by Chang Chien, Jr., and others, with a capital of $1 000 000, at Garden-road, Tungchow. The company will specialise in engineering and electricity contracts and work.

The Siemens-Schuckert Company, of Berlin, is establishing works at Shanghai, in co-operation with Chinese interests, for the manufacture of electrical fittings and supplies for domestic purposes. It is proposed to form a joint stock company which will embrace the pre-war China organisation of the Siemens companies and represent the Rhein-Elbe-Union (Stinnes) interests.

The Yau Hua Electric Company, of Hsuchow, was established in 1905. Three new plants have been installed and a new building erected, which was completed on Dec. 27. It is estimated that the three plants supply 30 000 lights.

Chung Hsin Electrical Company, Soochow, Kiangsu, has been amalgamated with the Soochow Electric Company. The latter was established in 1920 to compete with the Chin Shing Electrical Company, a part of which is owned by Japan.

A company to be known as the Ming Yuan Electric Light Company is being established at Chuchow, Anwhei.

The merchants of Hokow, Yunnan, have raised $20 000 for the establishment of the Hokow Electricity Company, Ltd.

Companies' Meetings, Reports, &c.

Edison Swan Electric.

The accounts of the Edison Swan Electric Company for the year ended June 30, 1921, show, after providing for various adjustments, a balance to the debit of profit and loss of £344 720. The board recommend that the sum of £55 000 now standing to reserve be transferred to profit and loss account, thus reducing the debit balance to the sum of £289 720. The directors regret that the operations of the company should have resulted in the loss shown, but the effect of the coal strike resulted in the company's business being practically brought to a standstill in many parts of the country. Under these circumstances the works could only be operated on a scale considerably below their full capacity, and various workshops were not able to carry their due proportion of overhead charges, but every effort has been made to reduce them to the lowest figure. A searching valuation of stocks of raw materials and manufactured and partly-manufactured goods has been made, and it has been found necessary to write £346 445 off as depreciation, this accounting for the greater portion of the loss. Since November last the position of the company has slowly improved, and with a moderate revival of trade the outlook for the company should become much more favourable. Since the date of the balance-sheet, loans from the bankers have been increased by £90 150, making the total loan advanced by them to date £313 950. A meeting of shareholders in November authorised an increase in the borrowing powers, and to provide the necessary security for the advances made the board have issued to the bank £100 000 Second Debenture stock, together with a further specific charge of £66 000 upon certain of the properties of the company. Mr. A. F. Philips and Mr. G. L. F. Philips, of Philips Glowlampworks, have retired from the board as technical directors. Subsequent to such retirement the board, under legal advice, commenced proceedings against Philips Glowlampworks with the view of determining the agreement existing between that company and the Edison Swan Electric Company, and also in relation to other matters. Mr. C. E. Hunter resigned his position as managing director in January, 1921, and Mr. C. J. Ford has been appointed in his stead.

British Aluminium.

The annual meeting of the British Aluminium Company, was held last week, Mr. A. W. Tait (Chairman), presiding.

The Chairman said that the net profit for the year was £221 506, compared with £428 157 in 1920, and the trading profit was £183 041, against £373 779. This substantial decrease, while very disappointing, was not unexpected. The trading for 1920 was a record, but at the last annual meeting he said that a sudden falling off in demand had become evident in August of that year. This depression assumed serious proportions about the end of the year and continued with increasing severity throughout 1921. The result was an over-production of metal. They closed two aluminium plants and one alumina plant, and reduced production at the works in the early part of the year. So far there had been no great improvement in the position, and the aluminium works in Norway were still closed down, although output at the works in Scotland had been somewhat increased. He could not see how they could expect business to show definite improvement until there was a more or less general return to normal trading conditions.

Having alluded to taxation as a great source of weakness in industry and to the need for drastic and immediate reduction of the burden, the Chairman said that the Lochaber Water Power Scheme was approved by both Houses of Parliament, and received the Royal Assent on July 28, 1921. The Act granted to a statutory company (which would be controlled by the British Aluminium Company) one of the largest water powers in the United Kingdom, and when this was developed it would give power for the further expansion of their industry in a district contiguous to the Kinlochleven works, and which would also provide power for the development of local industries. The scheme would not be proceeded with until the general conditions of trade and the expansion of their own industry warranted it. The total reserves were approximately £967 000, or very little short of the issued ordinary share capital. After meeting debenture interest, placing £20 000 to reserve for depreciation and £10 000 to reserve account, and paying the preference dividend and 5 per cent. on the ordinary shares a sum of £14 791 was carried forward.

Torquay Tramways.

In moving the adoption of the report and accounts at the annual meeting of the Torquay Tramways Company, Ltd., last week, Mr. H. T. Barnett (chairman of the company), who presided, said that although the coal strike seriously affected the receipts at one time, the year ended with an increase in revenue of £710, creating another record, and the number of passengers carried was the highest in the history of the company. The progress of the motor-'bus undertaking had been up to expectations, and the directors had every confidence in the future. Referring to the heavy taxation, the chairman stated that he thought the company was the only tramway company in this country that had been liable for excess profits duty, and that tax being now gone, the burden would be considerably eased in the future. It was important to bear in mind that the increased revenue was not due to increased fares, as the fares at Torquay were still on practically a pre-war basis. The accounts of the company disclosed a strong financial position. Although by Dec. 31 last an expenditure of £45 828 had been incurred on the motor-'bus undertaking, they finished the year with investments, cash at bank, &c., amounting to £43 089. The reserve and renewals

account had been increased from £48 000 to £59 000, and reserve for equalisation of dividends from £4 000 to £5 000. The motor-'buses capital account now stood at £45 828, as compared with £16 485, the increased expenditure being represented by additional rolling stock and the new garage. On the revenue side there should be a considerable decrease in the cost of current during 1922, in view of the substantial fall in coal. The balance carried to net revenue account was £26 397, compared with £24 968, and the additional profit in operating motor-'buses had been £8 188, compared with £2 582. The profit was £36 178, and after providing for debenture service and for the above reserves there was a balance of £11 370, out of which a dividend of 8 per cent., free of income tax, was recommended, carrying forward £2 206. The directors had under consideration the advisability of forming a subsidiary company to operate the motor-'bus undertaking, in view of the considerable expansion in the services which must take place, and shareholders' claims in that event would be taken into consideration.

Hadfields, Ltd.

Sir Robert Hadfield, Bart. (chairman of Hadfields, Ltd.), was unable to preside on Monday at the annual meeting of shareholders, but sent a message to the meeting from the Riviera, where he is recovering from an illness.

Sir Robert pointed out that the iron and steel industries throughout the world had felt the depression most acutely. The British output of pig-iron dropped from 8 000 000 tons in 1920 to 2 500 000 tons in 1921, the steel output from 9 000 000 tons to 3 500 000 tons, compared with 10 250 000 tons of pig-iron and 8 000 000 tons of steel produced by Great Britain in 1913. The strange fact was that, notwithstanding this acute depression, the world wanted and must have iron and steel on a large scale. A well-known American authority computed that the world to-day is short of no less than 200 000 000 tons of iron and steel. There must, therefore, be a large demand before long, or modern civilisation would receive a check, for the world's progress depended on ample supplies of the metal iron and on a much greater scale than the present production.

Mr. Peter B. Brown (managing director), in moving the adoption of the report and balance-sheet from the chair, said their post-war programme of reconstruction and extension was almost completed, and they were now eagerly awaiting an opportunity to put the new departments into operation. That could only be accomplished when the demand for their products matured. At the beginning of last year they had on their books a large volume of orders which had accumulated, some of them since before the war. The world slump in trade did not therefore affect them seriously until the latter part of the year. Its continuance, however, was naturally a source of anxiety to the directors.

The report and accounts were adopted, and a final dividend declared, making 5 per cent. for the year, free of tax.

Newmarket Electric Light.

The annual meeting of the Newmarket Electric Light Company was held last week, Mr. F. E. Gripper (chairman) presiding. During the past year the equivalent of 1 633 33-W lamps was connected to the mains, making the total connected at the end of 1921 40 566 lamps. The gross profit on the year's working was £3 435, compared with £2 953 in 1920. After providing for debenture interest (£710) and adding £249 brought in, a balance of £2 974 remained. The directors recommend that a dividend of 3 per cent. be declared, that £1 750 be carried to general reserve, and that the balance of £427 be carried forward. The Chairman, in moving the adoption of the report and accounts, said the company could have comfortably paid a 5 per cent. dividend this year if it were not for the restriction which existed owing to the Increase of Charges Act. The Government had introduced a Bill which would give the Electricity Commissioners power to deal with this point, and in the next few months they hoped to have an Order made by the Commissioners which would relieve them of this limitation. He thought they could look forward to a very much more satisfactory report next year; first, because the restriction as to dividend would have been removed; and, secondly, because there was a very substantial reduction in the cost of coal.

The Metropolitan Railway Company are making an issue of £600 000 5 per cent. preference stock at 87 in order to provide for additional power, plant and rolling stock.

Whitehall Electric Investments, Ltd., on Monday offered for public subscription £2 500 000 6 per cent. first mortgage debenture stock (1925-49) at £87½ per cent., and 1 500 000 7½ per cent. cumulative preference shares of £1 each at par.

The accounts of W. Canning & Company for 1921 show a loss of £23 671, after charging all expenses, including maintenance and full depreciation of properties, plant and fixtures, less surplus of £1 452 brought in, leaving deficiency of £22 218 carried forward.

Torpoint Electric Supply Company, Ltd., announce that they are issuing 950 7½ per cent. first debentures of £5 each at par. Further particulars can be obtained from the Secretary, 3, Fore-street, Torpoint, or from Mr. J. A. Pearce, 5, St. Aubyn-street, Devonport.

The profits of A. Reyrolle and Company for the past year, including balance brought in, amounted to £64 662, and a dividend of 12½ per cent. is recommended on the ordinary shares. £15 000 has been placed to reserve, leaving £12 190 to be carried forward.

The accounts of the London Electric Wire Company & Smiths for 1921 show profit, after placing £50 000 to reserve, of £83 924, making available, with £38 267 brought in, £122 851. General reserve is now £150 000; special reserve remains at £20 000. The directors recommend a final dividend on the ordinary shares, making 7½ per cent., less tax, carrying forward £44 545.

The South London Electric Supply Company has paid a dividend of 4½ per cent. on the ordinary shares, making 7 per cent., placing £12 500 to reserve for depreciation, &c., £17 500 to general reserve, £5 000 to reserve for contingencies, leaving £5 661 to be carried forward.

The receipts for 1921 of the Taunton Electric Traction Company, including £611 brought in, totalled £2 749. After deducting all expenses and debenture interest, there was a debit balance of £225 to be carried forward. During the year £2 000 5 per cent. debentures were redeemed. Further negotiations with the Corporation for the purchase of the undertaking having failed, steps have been taken to remove the tramways and realise assets.

At a special meeting of the shareholders of the Northampton Electric Light and Power Company last week it was decided to increase the capital of the Company to £350 000 by the creation of 100 000 additional "B" shares of £1 each, to be issued by the directors either as ordinary or preference shares as the directors may determine. This capital is required in connection with the extension of the works at Hardingstone Junction.

The revenue of the Bristol Tramways & Carriage Company for 1921 was £1 022 203 and working and general expenses and renewals £951 589, leaving with the balance brought forward, together with an amount recovered on an adjustment of income tax, net revenue of £104 100. It is proposed to pay a final dividend on the ordinary shares of 4 per cent., free of tax, making 7 per cent. for the year, carrying forward £3 668. After charging expenses of the issue of new ordinary shares and adjusting the value of investments at Dec. 31 last, the reserve fund amounts to £339 557. Receipts of the tramways department show an increase of £112 188.

The annual meeting of the Mirrlees Watson Company was held last week in the company's offices, Glasgow. The profit and loss account showed a profit for 1921 of £46 698, and, after providing for depreciation and directors' fees, a balance of £41 443 remains, to which is added the balance brought forward—namely, £14 409—leaving a sum of £55 853 at the credit of profit and loss. The meeting resolved that £15 942 be applied in payment of a dividend at the rate of 10 per cent. per annum, and a bonus at the rate of 2½ per cent. per annum, both less income-tax, and that £25 000 be transferred to general reserve account, leaving £14 911 to be carried forward.

The report of the Brush Electrical Engineering Company for 1921 shows, after providing for general charges, maintenance of plant and buildings and interest on debenture stocks and loans, a balance of £232 602, plus £141 983 brought forward, subject to excess profits duty for 1920 and previous years, income and corporation profits taxes, and directors' additional remuneration. The directors have allocated to depreciation of buildings and plant £14 400, and to patents and goodwill £600, further 4 per cent. interest on the prior lien participating second debenture stock £2 044, general reserve £73 191, and recommend a dividend at 15 per cent. on the ordinary shares for the year, directors' additional remuneration £2 267, carrying forward £214 074. The general reserve account has been increased during the year by £1 809, the profit on purchase of debenture stocks for sinking fund purposes. The £73 191 now appropriated to this account raises the general reserve fund to £150 000. The sum of £92 809 has been expended on capital account during year.

The annual report of Metropolitan-Vickers Electrical Company for the year ended Dec. 31 last shows that the profit available for the year, including the balance of £58 824 brought in, amounts (after providing for taxation) to £395 926, which has been appropriated as follows:—To special depreciation on plant, machinery, &c., £35 000; to general reserve account, £100 000; to dividend on preference and ordinary shares to Dec. 31, 1921, at 8 per cent. and 12½ per cent. respectively, less income tax, £168 111; leaving a balance of £92 815 to be carried forward. Orders received during the year, owing to the prevailing trade conditions, show a falling off as compared with the previous year. The works have, nevertheless, partly due to orders carried forward from 1920, been kept well employed. During the year 25 523 preference shares have been converted into 51 046 ordinary shares, making a total of 68 475 preference shares so converted. An application for a quotation of the ordinary shares resulting from the conversions in 1921 is now before the Stock Exchange.

The accounts of the Bromley (Kent) Electric Light & Power Company, Ltd., for the year to Dec. 31 last show a gross profit of £17 575, compared with £12 611 in 1920, and after payment of debenture interest, trustees' fees, &c., amounting to £3 002, writing off £3 000 of the cost of investments, and adding £1 314 10s. brought forward from last year, there is a balance of £12 887. The directors recommend the payment of a dividend of 10 per cent. for the year, which will absorb £7 500, that £4 500 be placed to depreciation and renewal reserve account, and that the balance of £887 be carried forward. During the year the connections have increased from 5 479 to 5 726 kW. To meet the increasing demand for electricity a supply in bulk has been arranged for from the works of the West Kent Electric Company. Additional machinery and mains are being laid down to utilise this supply, at a cost of about £15 000, which sum is being provided from the general reserve fund, and it is proposed to capitalise this amount by the issue of bonus shares to the value of £15 000 to the existing shareholders in proportion to their present holdings.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

ALLIES ELECTRIC LAMP REPAIRING COMPANY, LTD., Montgomery-street, West Kensington, manufacturers. £61 12s. 11d. Jan. 31.

BARRINGTON, W. Mead, 37-8, Strand, W.C., electrical engineer. £21 13s. 2d. Feb. 2.

BEADLE BROTHERS, 5, Coleridge-street, Burmantofts, electricians. £17 13s. 7d. Feb. 2.

DOWELLS ACCUMULATORS (1920), 79 Uxbridge-road, Hanwell, electrical engineers. £11 17s. 7d. Feb. 1.

VENN BROTHERS, 39, Turnham Green-terrace, W. 4., electrical engineers. £18 0s. 3d. Feb. 2.

WHITE, Mr. Francis G., 68, High-street, St. John's Wood, electrical contractor. £13 11s. 11d. Jan. 31.

Bill of Sale.

[The undermentioned information is from the Official Registry. It includes Bills of Sale registered under the Act of 1822 and under the Act of 1878. Both kinds require registration every five years. Up to the date the information was obtained it was registered as given below; but payment may have been made in some of the cases, although no notice had been entered on the Register.]

EVERSON, James Albert, 5, Carisbrooke-road, Walton, Liverpool, importer of electric globes, &c. March 21. £55.

Receivership.

CHASE BROTHERS, LTD. W. Peet, of 39, Mark-lane, E.C., was appointed receiver and manager on March 18, 1922, under powers contained in debenture dated Oct. 25, 1920.

Mortgages and Charges on Limited Companies.

[NOTE.—The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, created by a Company after the commencement of the Act, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges which would, if created after the commencement of the Act, require registration. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—followed by the date of the Summary, but such total may have been reduced since such date.]

COUNTY OF DORSET ELECTRIC SUPPLY COMPANY, LTD., Dorchester. Registered March 23, £500 debentures, balance of £2 500; general charge. *——. Dec. 31, 1920.

MODERN ELECTRICAL SUPPLY COMPANY, LTD., London, E.C. Registered March 23, £5 000 debentures; general charge.

WITTING (W.). LTD., Hull, electro-platers, &c. Registered March 23, £1 700 debentures and mortgage. *£1 800. Dec. 31, 1920.

Private Meetings.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

BEDESCO, LTD. (in voluntary liquidation), manufacturers of electric lighting sets, London. The creditors of the above were called together on April 3 at the offices of Messrs. Quaife & Tuke, accountants, 155, Fenchurch-street, London, E.C. Mr. A. E. Quaife occupied the chair, stating that the company had passed the usual resolution in favour of voluntary liquidation, and had appointed him to act as liquidator. He added that he had ascertained that the liabilities amounted to £1 169, while the net assets were expected to produce £139. The creditors passed a resolution confirming the voluntary liquidation of the company, with Mr. Quaife as the liquidator.

COATON, T. G. (trading as T. G. COATON & COMPANY), electrical engineer, 16, Humberstone-road, Leicester. The creditors of the above were called together recently, when a statement of affairs was presented which showed liabilities of £2 479. Of that amount £2 227 was due to unsecured creditors, and there were partly secured creditors for £396, who held securities valued at £144. After allowing £27 for preferential claims, the assets were estimated to realise £798, or a deficiency of £1 681. It was reported that the debtor commenced business in 1912 in partnership with his brother, the capital being about £300. Subsequently they were joined by another partner, who brought in £100. In 1919 the partnership was dissolved. At the date of the dissolution a balance-sheet prepared showed a capital of £1 700. After discussing the position, a resolution was passed to the effect that the debtor should execute a deed of composition to Mr. E. H. Hawkins, of Poppleton, Appleby & Hawkins, 4, Charterhouse-square, London, E.C., to secure the payment of a composition of 10s. in the £, payable as to 5s. in three months, 2s. 6d. in six months, and 2s. 6d. in nine months. A committee was also appointed, consisting of the representatives of Messrs. Drake & Gorham, British Thomson-Houston Company, and the General Electric Company.

HERBERT D. CARTER, LTD., electrical contractors and ironmongers, Edison House, Colwyn Bay. In response to a circular issued by the company, a meeting of the creditors of the above was held recently at Colwyn Bay. No statement of affairs was submitted, but it was stated that the company was a private limited liability concern, which was formed in March, 1915, with a capital of £5 000, divided into 4 000 ordinary and 1 000 preference shares of the face value of £1 each. The whole of the preference shares had been issued, while 3 000 ordinary shares has been issued. Of the issued capital of £4 000, the greater amount was for a consideration other than cash. In September, 1917, Mr. Carter advanced £1 100 to the business and was given a first debenture. In September, 1921, a second debenture for £1 500 was created. Until 1920 the company carried on business as electrical engineers, and the three largest creditors were for goods supplied in connection with such contracts. Since the date mentioned the company had also carried on business as ironmongers. A receiver had been appointed on behalf of the debenture holders. The meeting had been called for the purpose of a report being submitted as to the position, but no definite resolution was passed.

London Gazette.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

Bankruptcy Information.

COOKSON, Eugene (trading as W. TURNBULL & COMPANY), carrying on business at the Express Magneto Repair Works, Elizabeth-street and Charles-street, Blackpool, electrical, &c., engineer. Receiving order, March 28. Debtor's petition.

DICKEN, William John (trading as W. DICKEN & SON), 2, Upper High-street, Bargoed, co. Glamorgan, electrical engineer. First meeting, April 13, 12 noon, 34, Park-place, Cardiff. Public examination, April 27, 11 a.m., Town Hall, Merthyr Tydfil.

LUDLOW, Jesse Frederick, and LUDLOW, Robert Redvers, in co-partnership as LUDLOW BROTHERS, at 196, Church-road, Redfield, Bristol, electrical contractors. Receiving order, March 29. Debtor's petition. First meeting, April 12, 12.45 p.m., 26, Baldwin-street, Bristol. Public examination, April 21, 12 noon, Guildhall, Bristol.

NASON, Charles Frederick, 93, Butt-road, Colchester, electrician. Receiving order, March 27. Debtor's petition. First meeting, April 13, 12.15 p.m., 5, Butter-market, Ipswich. Public examination, April 26, 11.45 a.m., Law Courts, Town Hall, Colchester.

RAWCLIFFE, Frank (carrying on business under the style of FRANK RAWCLIFFE & COMPANY), 8, Nun-street, Newcastle-upon-Tyne, electrical engineer. First meeting, April 11, 12 noon, Official Receiver's Office, Pearl-buildings, 4, Northumberland-street, Newcastle-upon-Tyne. Public examination, May 4, 11 a.m., County Court, Westgate-road, Newcastle-upon-Tyne.

Partnership Dissolved.

PYNE, Harry Davies, and CLARK, Percival Francis, electrical engineers and manufacturers, at Latimer-road, Teddington, co. Middlesex, under the style of the PYNE MANUFACTURING COMPANY, by mutual consent as from March 18, 1922. Debts received and paid by H. D. Pyne.

Edinburgh Gazette.

M'COSH, Townley Johnson, and DEVINE, John M'Kinney, electrical, &c., engineers, 57, Peel-street, Mile End, Glasgow, under the style of M'COSH & DEVINE. Firm dissolved by mutual consent as at March 29, 1922.

Bankruptcy Proceedings.

PRINS, Nathan, merchant and agent, late 74, Forest-road, Dalston, N.E. Described in the receiving order made on March 16 upon the petition of Export Traders, Ltd., as above, the debtor had traded in electrical accessories. A Dutch subject, debtor came to this country in 1912. He was afterwards employed by a firm dealing in electric lighting appliances until the middle of 1919, when he began buying and selling electrical accessories on his own account at 74, Forest-road, Dalston. He possessed no capital, and managed to make £3 or £4 a week profit from the business. The claim of the petitioning and only creditor amounts to £143, and is in respect of goods supplied to the debtor in October, 1920. They obtained judgment against him in November last. The debtor is now employed by a firm of exporters and importers, and attributes his failure to slackness of trade and drop in the price of goods. He values his assets at £10. There was no proposal before the meeting, which was closed, and the case remained in the Official Receiver's hands.

Tenders Invited and Accepted.

UNITED KINGDOM.

Gravesend Town Council. April 12.—Wiring fifty-eight houses. Particulars from the Borough Electrical Engineer.

Bury (Lancs) Electricity Committee. April 15.—Supply and laying of about 1 000 yds. c.i. 3 ft. 6 in. pipes, construction of intake chamber, &c. Specifications from Borough Engineer.

Warrington Electricity & Tramways Committee. April 18.—Supply of h.t. and l.t. paper and lead covered cable. Specifications from Engineer.

Hornsey Town Council. April 20.—Cooling tower, &c. Specification from Borough Electrical Engineer.

Stepney (London) Electricity Committee. April 20.—Three 1 000 kW converting plants, 50-ton electric gantry crane, &c. Specifications from Borough Electrical Engineer.

Edinburgh Corporation. April 24.—Supply of 70 trucks and electrical equipment of cars; also wheels and axles. Specification from the Tramways Manager, 2, St. James-square, Edinburgh.

Metropolitan Asylums Board. April 26.—Two electric automatic passenger lifts and two electric automatic service lifts at Tooting Bec Mental Hospital. Specifications, &c., can be obtained at the Board's Offices, Embankment, E.C. 4.

Glasgow Electricity Department. May 1.—Supply of (1) cables (including small IR cables and flexibles); (2) meters; (3) carbons, for a period of twelve months. Particulars from R. B. Mitchell, Engineer, 75, Waterloo-street, Glasgow.

H.M. Commissioners of Works. May 4.—Supply of engineering labour for three years in the following districts:—Leeds (mechanical) Newcastle (electrical and mechanical), Southampton (electrical and mechanical). Particulars from Contracts Branch, H.M. Office of Works, King Charles-street, London, S.W. 1.

Brighton Corporation. May 8.—Supply, delivery and erection of (1) one 6 000 kW normal rating turbo-alternator and exciter, with condenser, complete with all necessary accessories; (2) one house service turbo-driven d.c. generating plant, comprising two 200 kW 230-280 V shunt wound generators in tandem, complete with all accessories. Particulars from the engineer and manager, Mr. John Christie, Electricity Department, North-road, Brighton.

Salford Corporation.—Electrically-driven detritus dredgers and/or reciprocating pumps for sewage works. Specifications from James Diggle & Son, 14, Brown-street, Manchester.

Wesley Church, Falmouth.—Electric light installation. Particulars from Rev. T. B. Hindsley, Wesley Manse, Falmouth.

AUSTRALIA.

Postmaster-General's Department at Melbourne.—* Sulphate of copper (Schedule No. 16), dry cells (Schedule No. 18). Tenders by April 11; ammonium chloride (Schedule No. 15), porous cells (Schedule No. 17). Tenders by April 23.

Postmaster-General's Department, Perth (W.A.). May 24.—* Supply and delivery of various accessories for telegraph instruments, including condensers, induction coils, receiver cords, fuses, &c. (Schedule No. 731.) (Ref., D.O.T. 8 273/ED/PN.)

Victorian Government Railway Commissioners. May 31.—* Two double-wheel lathes, including motors and control gear. (Contract 35 010.)

SOUTH AFRICA.

Municipal Council of Krugersdorp. April 24.—*Carrying out of the necessary work and the supplying of material for the conversion of the d.c. electric light system at Krugersdorp to a.c., viz., a.c. transformers, voltage regulators, cables, overhead transmission lines, switchgear, low-tension feeders and distributors, motors and meters. Alternate tenders are invited for the completion of the whole scheme and for taking over the electrical plant at present in Pretoria-street Power Station.

SOUTH AMERICA.

Local Authorities in Buenos Aires. June 28.—*Supply of complete machinery for hydro-electric generating station and transforming sub-station.

Skipton Urban Council has accepted the tender of the Western Electric Company for the supply and laying of electricity at £7 864.

St. Pancras (London) Council have accepted the tender of the Underfeed Stoker Company for ash conveying plant for King's-road station, £2 555.

Liverpool Corporation have accepted the tender of Tilling-Stevens Motors, Ltd., for a petrol-electric chassis for the turntable fire escape, £1 080 10s.

Hull Corporation Telephones Committee have accepted the tender of the Western Electric Company, £2 237 10s., for an automatic exchange in East Hull.

Chester Corporation have accepted the tender of the Metropolitan-Vickers Electrical Company for switchgear in connection with electricity supply to Hoole, at £915.

Bermondsey (London) Council have accepted the tender of Gillett and Johnson (lowest tender) for synchronising clocks in the Council's buildings at £236 4s. 6d. Two other tenders (£262 and £290) were received.

Dundee Town Council has accepted the tender of a Berlin firm for the supply of cables for the electricity undertaking, the same quality cable being 10 per cent. cheaper than the lowest British offer at £851.

London County Council have accepted the tender of Medway's Safety Lift Company for electric passenger lift at Geoffrey House, Tabard Garden Estate, at £775. Eleven tenders were received, ranging from £715 to £1 550.

Dundee Corporation have accepted the tenders of the British Thomson-Houston Company for converting machinery at £16 927, and supply of switchgear, £1 413 11s., and the Yorkshire Hennebique Company for circulating water-pipes, &c., £11 011 18s. 6d.

Eston Urban Council has accepted the tender of Clough, Smith & Company for the supply and erection of the overhead equipment, comprising 700 poles, &c., and the supply and laying of about 4¼ miles of underground mains in connection with the town lighting of South Bank, Grangetown, Normanby and Teesville.

Glasgow Corporation have accepted the tenders of Hackbridge Cable Company for e.h.p. cable for Pinkston station, and English Electric and Siemens' Supplies for switches for Parkhead Depot. The tender of R. J. Sinclair for electrical installation work in 750 houses at Mosspark, at £8 933, has also been accepted.

Hammersmith Borough Council have accepted the following tenders for the year commencing April 1: Enfield Edison Cable Works, Ltd., insulated wires, £140 18s. 8d., less 2½ per cent.; Albion Clay Company, stoneware conduit, £140 18s. 8d., less 2½ per cent.; W. Lucy & Co., draw boxes, frames and covers, &c., £319 14s.

Edinburgh Tramway Committee, by a majority, recommend the acceptance of the quotation of a German manufacturer in Cologne for 130 tons of tramway rails and 5 tons of fishplates. The German firm quoted, through their British agent, £1 365, and the nearest British offer was £1 495. Bailie Sleigh and Councillor Couston opposed acceptance of the foreign quotation. The Committee also unanimously agreed to accept the tender of another German firm for steel poles. The British quotation was £7 977, as against £5 436 by a Düsseldorf firm.

---

* *Particulars from the Department of Overseas Trade.*

Openings for Trade in the Netherlands.

According to the Dutch Press, the N.V. Electriciteitsfabriek IJsselcentrale at Zwolle are drawing up plans for the extension of their power station. A large new boiler house will be built. Work will commence in the course of this summer. The Limburgsche Tramweg Mij. (technical manager, A. P. Zuurendonk, Grasbroekenweg 4, Heerlen; engineer, J. M. Meijer, of Kruisstraat 26, Heerlen) have plans in hand for laying a large tramway system in South Limburg, of which several lines will be put into execution this year. It has been decided to build a current-redressing installation with a capacity of 1 850 kW. The firm of Aaldijk "De Groene Molen," of Zuidwal, Delft, intend converting their windmill into a mill driven by electric power. Work will probably commence this summer. The "Provincial Electriciteitsbedrijf van Groningen" (Provincial Electric Supply Company, of Groningen) intend extending their electric power station by building a big new boiler house. Work will probably commence next autumn. A proposal has been put forward in Rotterdam Town Council to grant a credit of Gld. 65 000 for the transport by means of mechanical device of the ash at the refuse destructor works.

Imperial Trade Correspondents.

With reference to the suspension of certain Imperial Trade Correspondent posts in the Dominions announced in our columns recently, the Department of Overseas Trade state that the following, who previously served as Imperial Trade Correspondents, have volunteered to continue their services in an honorary capacity:—

Canada.—Mr. J. B. Sutherland, Lougheed Building, Calgary, Alberta; Mr. R. N. Frith, 200, Moser-Ryder Building, Edmonton, Alberta; Mr. W. E. Anderson, 162, Prince William-street, St. John, New Brunswick; Mr. E. A. Saunders, Board of Trade, Halifax, Nova Scotia; Mr. G. B. Ramsey, 53, Dalhousie-street, Quebec.

New Zealand.—Mr. W. T. Monkman, Bond-street, Dunedin.

Arrangements have been made for Mr. G. R. Stevens, the Canadian Trade Commissioner stationed in Jamaica, to act as honorary Trade Correspondent to the Department of Overseas Trade in that colony, instead of the Colonial Secretary, who has hitherto acted in that capacity. Trade inquiries for Jamaica should accordingly be addressed in future to Mr. G. R. Stevens, Canadian Trade Commissioner, 17, Port Royal-street, Kingston, Jamaica. Cable address: "Cantracom" (Bentley's five-letter code).

Mr. Hugh Horne, Commercial Secretary to H.M. Embassy at Tokio, who is at present in this country, will shortly be returning to Japan. He will be in attendance at the Department of Overseas Trade until April 13, and will be pleased to interview any firms in the London area who desire information or assistance in connection with export trade with Japan.

A petition to the King in Council for a charter of incorporation for the Federation of British Industries has been referred to a committee. Petitions for or against the grant must be delivered by May 5

New Companies.

Henry Summers & Sons.

Henry Summers & Sons, Ltd. (180 666). Private company. Registered March 28. Capital, £3 000 in £1 shares (1 300 8 per cent. cumulative preference and 1 700 ordinary). To take over the business of electrical and general engineers, &c., carried on at 1A, Essian-street, and 13A, Anchor-street, Stepney, E., by H. Summers, W. D. Summers and L. Summers who are the first directors of the company. Secretary : L. Summers. Registered office : 1A, Essian-street, Stepney, E 1.

Jowitt Engineering Company.

Jowitt Engineering Company, Ltd. (180 713). Private company. Registered March 29. Capital, £750 in 1s. shares. To take over the business carried on by the Jowitt Engineering Company, to adopt an agreement with J. E. Hackford and R. F. Power, and to carry on the business of manufacturers of gas producers and rotary and reciprocating engines of all kinds, whether for oil, gas, steam, water, electricity or other motive power, &c. Permanent directors : J. E. Hackford (chairman) and R. F. Power. Solicitors : Warren, Murton & Company, 45, Bloomsbury-square, W.C. 1.

Light & Power Company.

Light & Power Company, Ltd. (180 591). Private company. Registered March 24. Capital, £2 000 in £1 shares. Electricians, mechanical engineers, manufacturers, workers of and dealers in electricity, motive power and light, &c. First directors : W. Cussens and H. R. Brown. Secretary : W. Cussens. Registered office : 39, Norfolk-street, Sheffield.

Milliken Brothers.

Milliken Brothers, Ltd. (180 722). Private company. Registered March 29. Capital, £10 000 in £1 shares. To adopt an agreement with the Milliken Brothers' Manufacturing Company, Incorporated, of New York, and to carry on the business of wireless, electrical, mechanical and mining engineers, electricians, suppliers of electricity, manufacturers of and dealers in and letters on hire of the unit system of structural steel as described in Patent No. 17 136 of 1915, &c. First directors : C. T. Wilkinson, W. H. P. Gibson and C. T. Clack. Registered office : Amberley House, Norfolk-street, Strand, W.C.

Spensers, Ltd.

Spensers, Ltd. (180 818). Private company. Reg. March 31. Capital, £12 000 in £1 shares. Manufacturers of and dealers in electrical plant, machinery, meters, apparatus and appliances, producers and suppliers of electricity, electrical, mechanical, hydraulic, and general engineers, &c. First directors : H. E. Smith, K. Smith, and C. K. Black. Secretary : C. Kennedy Black. Registered office : 6, London-street, Paddington.

Whitehall Electric Investments, Ltd.

Whitehall Electric Investments, Ltd. Registered March 30. Nominal capital, £6 500 000 in 1 500 000 7½ per cent. cumulative preference and 5 000 000 ordinary shares of £1 each. To acquire certain bonds, debentures and debenture stock comprised in an agreement (not filed) with the Whitehall Securities Corporation, Ltd., to subscribe for, underwrite, acquire, hold and deal in the shares, stocks and securities of any electrical undertakings, and transport and public utility services, to acquire any licences or concessions for or in connection with the generation, utilisation, distribution and supply of light, heat, sound and power, by electricity or otherwise, or with the construction, equipment and control of railways, tramways and electric lighting and power supply works, and the carriage of passengers and goods; to supply electricity for all purposes, to carry on business as electrical engineers and contractors, &c. First directors : Hon. Clive Pearson, Sir Clarendon G. Hyde, Vincent W. Yorke, J. H. Macdonald and A. E. Worswick. Secretary : J. Lister Walsh. The registered office is at 47, Parliament-street, S.W. 1. File number, 180 780.

The Siemens Company also co... the use of gas on ing their estimate to five times the cost of gas here, he might say With regard to a better light being obtained by four times the cost an improved system, as in Fleet-street and elsewhere inserted the *sic* that the cost of the gas in Fleet-street was over ... light." of the Brush system of electric lighting. We ha... above, as we believe it should read "the Weston

Arrangements for the Week.

FRIDAY, April 7th (to-day).

Institute of Cost and Works Accountants.

7.30 p.m. At the Chamber of Commerce, New-street, Birmingham. Public Lecture on "The Functions of Works Accountancy," by Mr. J. A. Lacey.

Junior Institution of Engineers.

8 p.m. At Caxton Hall, London, S.W. Lecturette on "Engineering in Southern Persia," by Mr. J. W. Maple.

Edinburgh Electrical Society.

8 p.m. At Philosophical Institute, 4, Queen-street, Edinburgh. Lecture entitled "Notes on A.C. and D.C. Plant," by Mr. J. Walker.

Royal Institution.

9 p.m. At Albemarle-street, London, W. Discourse on "The Evolution of the Elements," by Sir Ernest Rutherford, F.R.S.

SATURDAY, April 8th.

Royal Institution.

3 p.m. At Albemarle-street, Piccadilly, London, W. Lecture on "Radio-Activity," by Sir Ernest Rutherford, F.R.S. (Lecture VI.).

Birmingham and District Electric Club.

7 p.m. At the Grand Hotel, Colmore-row, Birmingham. Paper entitled "Notes on Marine Salvage," by Mr. V. H. Pearson.

MONDAY, April 10th.

Institution of Electrical Engineers.
North-Eastern Centre.

7.15 p.m. At Armstrong College, Newcastle. Annual General Meeting.

TUESDAY, April 11th.

National Association of Supervising Electricians.

6.45 p.m. At St. Bride's Institute, Bride-lane, London, E.C. Lecture on "Temporary Expedients," by Mr. W. E. Highfield.

Institution of Electrical Engineers.
North-Western Centre.

7 p.m. At the Engineers' Club, Albert-square, Manchester. Discussion on "High-Power Mercury Arc Rectifiers," introduced by Mr. R. L. Morrison.

Institution of Electrical Engineers.
Scottish Centre.

7.30 p.m. At 207, Bath-street, Glasgow. Annual General Meeting. Paper on "Rotary Converters, with Special Reference to Railway Electrification," by Mr. F. P. Whitaker.

WEDNESDAY, April 12th.

Association of Engineers-in-Charge.

7.30 p.m. At St. Bride's Institute, Bride-lane, Fleet-street, London, E.C. Paper entitled "The Artesian Wells and Geological Strata of London," by Mr. R. Langton Cole, F.R.I.B.A.

Prices of Metals, Chemicals, &c.

Tuesday, April 4.

		Price.	Inc.	Dec.
Copper—				
Best selected	per ton	£61 10 0	—	£1 0 0
Electro Wirebars ..	,,	£64 10 0	—	£1 5 0
H.C wire, basis	per lb.	0s. 9 1/16 d.	—	1/16 d.
Sheet	,,	0s. 9 1/16 d.	—	¼d.
Phosphor Bronze Wire (Telephone)				
Phosphor-bronze wire, basis	,,	1s. 1 5/16 d.	—	⅛d.
Brass 60/40—				
Rod, basis	,,	0s. 7½d.	—	—
Sheet, basis	,,	0s. 9½d.	—	¼d.
Wire, basis.....	,,	0s. 9¾d.	—	¼d.
Pig Iron—				
Cleveland Warrants .	per ton	£4 15 0	—	—
Galvanised steel wire, basis 8 SWG	,,	£18 0 0	—	£1 0 0
Lead Pig—				
English	,,	£23 0 0	—	—
Foreign or Colonial ..	,,	£21 15 0	2s. 6d.	—
Tin—				
Ingot	,,	£143 10 0	—	5s.
Wire, basis	per lb.	1s. 11¾d.	—	⅛d.
Aluminium Ingots	per ton	£120 0 0	—	—
Spelter	per ton	£25 12 6	7s. 6d.	—
Mercury	per bottle	£11 0 0	—	—

Salammoniac.—Per cwt. 65s.-60s.
Sulphur (Flowers).—Ton £10 15s.
,, (Roll-Brimstone).—Per ton £10 15s.
Sodium Bichromate.—Per lb. 5½d.
Sodium Chlorate.—Per lb. 3½d.
Sulphuric Acid (Pyrites, 168°).—Per ton £9 17s. 6d.
Copper Sulphate.—Per ton £26 10s.
Boric Acid (Crystals).—Per ton £60
Rubber.—Para fine, 10½d. ; plantation 1st latex, 8½d

The metal prices are supplied by British Insulated & Helsby Cables, Ltd, and the rubber prices by W. T. Henley's Telegraph Works Company.

Patent Record.

SPECIFICATIONS PUBLISHED.

The following abstract from some of the specifications recently published have been specially compiled by MESSRS. MEWBURN, ELLIS & Co., *Chartered Patent Agents, 70 and 72, Chancery-lane, London, W.C.*

COMPLETE SPECIFICATIONS.

144 319 HUBERS, G. X-ray plant. (8/4/16.) (Addition to 144 318.)
145 073 SIEMENS-SCHUCKERTWERKE GES. Sparkless disconnection of conductors traversed by electric currents. (9/11/15.) (Addition to 145 072.)
145 084 LILIENFELD, J. E. Process and apparatus for the production of Rontgen rays. (9/4/18.)
145 589 OESTERREICHISCHE SIEMENS-SCHUCKERTWERKE. Method of starting continuous current motors. (29/1/16.)
145 629 GES. FÜR DRÄHTLOSE TELEGRAPHIE. Electro-magnetic wave receiving arrangements. (6/5/18.)
145 676 SIEMENS-SCHUCKERTWERKE GES. Vacuum electric discharge apparatus. (13/8/15.)
145 677 SIEMENS-SCHUCKERTWERKE GES. Anodes for vacuum electric discharge apparatus. (29/10/15.) (Addition to 145 676.)
146 136 DUPLEX ENGINE GOVERNOR CO., INC. Electrically-operated speed-regulators. (23/6/19.)
146 155 FESSENDEN, R. A. Methods and apparatus for use in locating submerged vessels and other submerged and subterranean magnetic bodies. (12/12/18.)
147 147 BRITISH THOMSON-HOUSTON CO., LTD. Wireless signalling systems. (29/10/13.)
147 177 VAPOR CAR HEATING CO., INC. Electric contact thermostats. (19/1/18.)
147 592 KRUPP AKT.-GES., F. Overload electric switches. (15/5/19.)
147 783 APPLE, V. G. Contact members for vibrating current controlling regulators. (14/2/18.)
147 788 APPLE, V. G. Armature construction. (27/4/18.)
147 818 BRITISH THOMSON-HOUSTON CO., LTD. Dynamo-electric machines. (13/10/15.)
148 418 SIGNAL GES. Arrangement for avoiding disturbing noises in listening devices caused by changing circuits associated therewith. (30/3/17.) (Addition to 147 948.)
148 424 SIGNAL GES. Sound-receivers. (29/11/15.)
148 426 SIGNAL GES. Sound apparatus. (15/3/16.)
148 427 SIGNAL GES. Sound-signalling device for dense propagating mediums. (3/3/17.)
148 458 KRUPP AKT.-GES., F. Electric resistance connections. (21/11/18.)
148 951 LATOUR, M. C. A. Receiving-arrangement for the reception of electro-magnetic waves. (21/10/16.)
148 952 LATOUR, M. C. A. Inductances. (12/12/18.)
148 969 NEUFELDT & KUHNKE (Firm of). Electric connecting devices for floating and submarine vessels, and for diving armour. (21/7/16.)
148 982 SIGNAL GES. Sound-signalling device with two plates for dense mediums. (27/4/17.) (Addition to 148 427.)
148 987 SIGNAL GES. Submarine sound transmitter. (3/5/18.)
148 988 SIGNAL GES. Receiving device for submarine sound signals. (19/5/17.) (Addition to 1 995/13.)
149 325 SIGNAL GES. Reception of submarine sound signals. (25/1/17.)
149 331 WESTERN ELECTRIC CO., LTD. Telephone repeating circuit. (31/7/19.)
149 348 ADAMCZAK, L. Alternating current meter. (22/7/19.)
150 673 GYURIS, J. Manufacture of electric heaters. (22/8/19.)
150 730 METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Time-limit relays for use in electrical supply systems. (3/9/19.)
151 615 CUMMISKEY, W. M. Timing or distributing mechanism for the electric ignition of internal combustion engines. (24/9/19.)
152 970 LAÜT, P. J. Sending devices for radio-telegraphic stations using a continuous sequence of waves generated by an arc. (23/10/19.)
154 545 SOC. ANON. BROWN, BOVERI, ET CIE. Electric transformer for feeding metal vapour rectifiers. (27/11/19.)
154 877 SIEMENS-SCHUCKERTWERKE GES. Electric suspension insulators. (29/11/19.)
155 796 REMY ELECTRIC CO. Magnetos. (17/12/19.)
156 492 EUSTACE, A. L. Electric cartridge fuse. (23/7/14.)
157 567 SIEMENS SCHUCKERTWERKE GES. Electric suspension insulators. (6/1/20.) (Addition to 154 877.)
159 130 SIEMENS-SCHUCKERTWERKE. Arrangement of the high tension insulators of electric precipitating installations. (11/2/20.)
159 902 SIGNAL GES. Method and device for the electrical navigation of ships. (12/3/20.)
165 037 SOC. FRANÇAISE RADIO-ELECTRIQUE. Electric-magnetic wave transmissions systems. (16/10/19.) (Divided application on 147 465.) (Addition to 147 465.)
167 145 METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Control of alternating current electric motors. (30/7/20.)
169 060 SIEURIN, S. E. Burning of carbon electrodes in electric furnaces. (19/7/20.)
169 063 CHERRY, L. B. Electrical apparatus for the electro-chemical treatment of hydrocarbon vapours. (20/7/20.)
169 071 RUNKEL, A. C. Electric lamp supports. (28/7/20.)
169 078 RENZI, W. DE. Electrical current plugs. (30/7/20.)
169 082 OLDHAM, O., OLDHAM, G., & OLDHAM, J. Gas exits for galvanic batteries. (9/8/20.)
169 085 PAYNE, V. J. C. Alternating current electro-magnetic engine. (13/8/20.)
169 093 BROOKS, H. B. Electric transforming systems or devices. (6/9/20.)
169 105 LOIJA, M. R. Electrically-propelled boat. (27/9/20.)
169 482 WHITEHORN, H. K. Dynamo-electric machinery. (26/5/20.)
169 489 TURNER, F. Attachment for telephones. (8/11/20.)
169 494 SULLIVAN, H. W. Telegraph cables. (22/6/20.)
169 503 TURQUAND, F. J. Electric battery lamps. (23/6/20.)
169 510 SCHATTNER, E. Electric circuit making and breaking device. (25/6/20.)
169 535 RAILING, M. J., SAUNDERS, C. W., & COLLINGS, J. H. Electric bell and the like indicators. (2/7/20.)
169 538 BRITISH THOMSON-HOUSTON CO., LTD. (General Electric Co.). Electric welding electrodes. (2/7/20.)
169 541 SAUNDERS ELECTRICAL CO., LTD., & SAUNDERS, C. Electrical accumulators. (5/7/20.)
169 546 GENERAL ELECTRIC CO., LTD., & THOMPSON, M. Electron discharge devices. (6/7/20.)
169 548 RICKETS, W. J. Electrical systems and apparatus for inducing chemical action. (8/7/20.)
169 553 BRITISH ELECTRIC TRANSFORMER CO., LTD., & ROOTHAAN, J. Manufacture of coils suitable for use in the construction of static transformers. (12/7/20.)
169 563 SCHATTNER, E. Apparatus for the distance control of electric switches by means of light radiations (19/7/20.)
169 564 PILLON, L. Secondary electric clocks. (19/7/20.)
169 575 RENZI, W. DE. Electrical switch gear for controlling the supply of electricity to operate machinery and the like. (27/7/20.)
169 582 NERBONNE (NÉE ARMAGNAT), VEUVE, C. M. A. DE, ARMAGNAT, S. M. T., & ARMAGNAT, P. J. Method of measuring the lengths of electric waves. (30/7/20.)
169 604 ELLISTON, E. R. Electric service lifts. (21/8/20.)
169 609 METROPOLITAN-VICKERS ELECTRICAL CO., LTD. (Westinghouse Electric & Manufacturing Co.). Automatic electric sub-station systems. (26/8/20.)
169 610 IGRANIC ELECTRIC CO., LTD. (Cutler-Hammer Manufacturing Co.). Means for regulating alternating currents. (26/8/20.)
169 627 SHANGHAI ELECRTIC CONSTRUCTION CO., LTD. (McColl, D.) Trolley heads for electric traction vehicles. (29/9/20.)
169 649 ANTINORO, E. Safety fuses for electric circuits. (14/12/20.) (Addition to 151 523.)
169 735 HITCHCOCK, S. I. Permanent magnets and permanent magnet motors. (6/4/20.)
169 744 SCOTT, W. H. Electrically-driven winches. (5/5/20.)
169 756 MORGAN CRUCIBLE CO., LTD., & PAYNE, G. I. Electrically-heated tubes, muffles, and the like. (2/6/20.)
169 761 OLDHAM, G., & OLDHAM, J. Electric lamps particularly adapted to be carried or supported on the person. (4/6/20.) (Cognate Application, 29436/20.)
169 767 LATOUR, M. C. A. Two-phase high-frequency electric alternating current generators. (23/6/20.) (Patent of Addition not granted.)

APPLICATIONS FOR PATENTS

March 7, 1922.

6 622 FULLER'S UNITED ELECTRIC WORKS & L. FULLER. Galvanic batteries.
6 633 A. FORTESCUE. Anti-vibration fitting for electric light.
6 637 T. F. WALL. Induction motors.
6 651 A. L. DAVIS. Electric switches.
6 685 R. L. WOOD. Driving means for car-lighting dynamos.
6 709 D. TINLOT. Electric switches.
6 713 EURAL PATENTS, LTD., & H. J. WALLER. Electric contact makers for steering wheels of motor vehicles.
6 715 J. T. M. MORRIS & F. R. F. RAMSAY. Obtaining polar diagrams of alternating electro-motive force or current.
6 717 T. N. WHITEHEAD. Electro-magnetic compasses
6 723 W. F. HIGGS. Induction motors.
6 732 AUTOMATIC TELEPHONE MFG. CO. Tag blocks, terminal strips, &c.
6 734 METROPOLITAN-VICKERS ELECTRICAL CO. & N. G. LANGRISH. Controllers for electric cranes, &c.
6 736 C. H. VIDAL. Electric drilling machines
6 740 H. P. R. REES. Wireless telegraph and telephone receivers.
6 741 A. PÜSCHEL. Incandescent lamp holders.
6 747 D. FORREST. Apparatus for remagnetizing magneto magnets and recharging batteries.
6 755 ETAB. DE DION-BOUTON, SOC. ANON. Regulating devices for electric installations. (14/4/21, France.)

March 8, 1922.

6 793 R. F. WOODBURN. Electric resistance welding.
6 821 METROPOLITAN ELECTRIC TRAMWAYS, LTD., & L. B. HEWITT. Electric vehicles.
6 822 HUMBER, LTD., J. A. COLE & L. J. SHORTER. Electrical starting mechanism for fluid pressure engines.
6 827 A. L. OLIVER. Waterproof electric blasting cap.
6 833 A. E. BEATTIE. Magneto detectors and actatic and directional magnetic compasses.
6 849 R. ARRAYA. Producing electro-anæsthetic current for treatment of nervous diseases.
6 854 A. S. CACHEMILLE (Westinghouse Electric and Mfg. Co.). Control of electric machines.
6 857 R. AMBERTON. Electricity meters.
6 858 R. AMBERTON & R. H. BARBOUR. Electrical testing apparatus.
6 862 P. D'AIGNEAUX. Converting d.c. into high frequency a.c.
6 867 J. HIGGINSON. Electric ignition systems.
6 898 RELAY AUTOMATIC TELEPHONE CO. & E. J. C. ROUSSEAU. Automatic telephone systems.
6 905 AUTOMATIC TELEPHONE MFG. CO. Telephone systems. 20/2/21, U.S.)
6 909 W. J. READETT. Electric machines for heating rivets, &c.

March 9, 1922.

6 919 H. S. ROGERS & W. PRESTON & W. WALKER. Electric switches.
6 955 R. M. BEARD. Electric lighting fixtures.
6 962 J. & A. MORGAN. Lead connectors for electric terminals.
6 994 B. T.-H. CO. (G. E. Co.). Electric switches.
6 998 J. H. NICHOLSON. Electric talking machines, &c.
7 001 C. J. ASTON & A. G. T. CUSINS. Wireless masts.
7 008 R. MIEHL. Synchronous motor for electric drive of clockworks.

March 10, 1922.

7 041 H. L. MOISELLE. Electrical shop sign.
7 047 S. O. COWPER-COLES. Leading in wires for incandescent lamps.
7 048 A. M. TAYLOR. Joints of h.t. cables.
7 105 A. A. BULL. Current collecting apparatus for electric railways and tramways.
7 106 & 7 107 C. W. KAY. Current collecting apparatus for railways and tramways.
7 121 METROPOLITAN-VICKERS ELECTRICAL CO. & K. BALMANN. Ventilating or cooling electrical machines.
7 125 A. REYROLLE & CO. & R. W. BILES. Protective arrangements for a.c. circuits.
7 126 ELECTRICAL IMPROVEMENTS, LTD., & R. W. GREGORY. Electric switch fuses.
7 142 E. VARÉ. Elements for storage battery cells. (10/3/21, Belgium.)
7 152 NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABR. Carbon bodies. (12/3/21, Holland.)
7 174 SOC. ANON DES ATELIERS DE SÉCHERON & C. J. BELLI Couplings for machines of high voltage d.c. series system. (15/4/21, Germany.)
7 176 GES. FÜR DRAHTLOSE TELEGRAPHIE. Antenna systems for wireless signalling. (12/3/21, Germany.)

March 11, 1922.

7 197 F. W. PELLANT. Contact legs for thermionic valves.
7 210 I. H. PARSONS. Electric horns.
7 229 F. T. ASHTON. Projection arc lamp.
7 240 ELECTRICAL IMPROVEMENTS, LTD., R. W. GREGORY & L. C. GRANT. Protective devices for d.c. circuits.
7 252 METROPOLITAN-VICKERS ELECTRICAL CO. & G. A. CHEETHAM. Electric fuses.
7 258 GENERAL ELECTRIC CO., LTD., & J. J. GRACIE. Incandescent lamps, &c.
7 260 P. C. RUSHEN (Siemens-Schuckertwerke). Electrical separation of suspended particles from gases.
7 265 E. SOMMERFIELD. Locking devices for electric safety lamps. (12/3/21, Germany.)

March 13, 1922.

7 270 CABLE ACCESSORIES CO. & P. W. DAVIS. Wall plugs.
7 278 FORGES ET ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE JEUMONT. Cascade rotary converters. (5/4/21, France.)

7 295 W. J. Gooderidge. Electric horns, &c.
7 297 British Insulated & Helsby Cables, Ltd. & F. J. Brisler. Electric cables.
7 309 P. T. Hayes. Telegraph typewriting machines.
7 317 A. Howes. Electric switches.
7 320 A. J. D. Krause & A. H. Railing. Electric cut-outs.
7 321 J. B. Belcher. Connector for insulated wires and cables.
7 326 M. F. Fisher & B. E. Thompson. Apparatus for electrical treatment of baldness, &c.
7 332 H. Baran (Aldendorff). Automatic, &c., telephone switching systems.
7 336 Radio Communication Co. & N. Lea. Method for determining direction of electro-magnetic or electro-static fields.
7 345 Western Electric Co. Printing telegraph receiver.
7 346 Buckley, Saunders & Co. Uniting metal bodies electrically.
7 358 A. Negromanti. Thermo-electric fabric.
7 366 E. P. Barfield & L. W. Wild. Electric furnaces.
7 369 Watliff Co., A. O. Hinchliff & S. J. Watson. Producing commutator bars.
7 371 V. Parvopassu, G. Gallo & R. Lenner. Unfusible electro-thermic safety devices.
7 378 A. Watts. Registration of telephone calls.

March 14, 1922.

7 411 C. E. P. Gabriel. Portable electric lamps.
7 416 W. C. Mitchell. Identification labels for cables.
7 437 Plantation Rubber Manufacturing Co. & M. M. Dessau. Devices for attachment to mouthpieces of transmitters.
7 446 A. T. Scorey. Apparatus for testing strength of permanent magnets.
7 471 Metropolitan-Vickers Electrical Co. Electric circuit interrupters. (14/3/21, U.S.)
7 472 Metropolitan-Vickers Electrical Co., B. S. & W. Whiteley & A. P. M. Fleming. Electrical insulating cylinders.
7 476 L. A. Cordenot. Manufacture of electric insulators from ceramic paste. (21/3/21, France.)
7 483 Ever Ready Co. (Great Britain) & C. S. Mummery. Inert cells.
7 484 F. Schuster. Electrically heated mould for finishing stockings, gloves, &c.
7 494 J. M. Miller. Amplifiers. (15/3/21, U.S.)
7 509 E. C. R. Marks (Bennett). Telephone mouthpiece disinfectant.
7 510 E. C. R. Marks (Colonial Lamp and Fixture Works). Portable lighting fixtures.
7 513 G. A. Bartholomew. Electric power accumulator.

March 15, 1922.

7 532 T. F. Wall. Induction motors, &c.
7 536 E. R. Bickley. Call recorders for telephones.
7 541 B. J. Baker. Electric control of a number of telephones.
7 548 R. H. Playfoot. Accumulator and accessory cases for motor cycles, &c.
7 621 Soc. Le Carbone. Electric cells. (3/6/21, France.)
7 622 Soc. Le Carbone. Wet electric cells. (9/12/21, France.)
7 632 W. H. Gwynn. Glass electrodes for high-frequency currents.

March 16, 1922.

7 651 E. Temple. Attaching wires to sparking plugs.
7 674 E. W. Reed. Electric lighting systems of motor vehicles, &c.
7 684 Implitico, Ltd. & H. S. & W. R. Lambert. Electric advertising signs.
7 708 Metropolitan-Vickers Electrical Co. & A. Stubbs. Control of turbine-driven electrically operated winding plant, &c.
7 735 D. C. Crowe. Electro-magnetic relay.
7 738 Magnet Motoren Akt.-Ges. Air-cooled cylinders. (22/3/21, Germany.)
7 739 B. T.-H. Co. & H. W. Taylor. Electric machines.
7 753 A. P. Welch. Transformers for wireless circuits.
7 770 Park Royal Engineering Works & W. J. Davis. Switch gear of the truck type, &c.
7 771 British Power Railway Signal Co. & J. Ashton. Electric switch point detecting apparatus.
7 774, 7 778 and 7 776 A. Baderna. Electric cut-outs. (17/3/21, Italy.)

March 17, 1922.

7 785 A. E. Honey & L. Snellgrove. Electro-magnetically operated switch mechanism.
7 814 C. J. Gordon. Electric vehicles.
7 830 F. J. Holtom, T. Taylor & M. J. Railing. Electric switch and fuse boxes.
7 842 Automatic Telephone Manufacturing Co. Switching mechanism for telephone systems. (28/3/21, U.S.)
7 846 A. J. H. Elverson. Electric contact breakers.
7 847 W. Clark. Electric switches.
7 852 Automatic Telephone Manufacturing Co Telephone systems. (26/4/20, U.S.)
7 855 J. Stone & Co. Electro-magnetically operated switch mechanism.
7 859 Radio Communication Co. & J. Scott-Taggart. Electric signalling systems.
7 860 Radio Communication Co. & J. Scott-Taggart. Oscillating valve systems, &c.
7 870 Akt. Ges. Brown, Boveri et Cie. Multiple control apparatus for electric railways. (17/3/21, Switzerland.)
7 881 T. J. T. Hodgkinson. Electric massage apparatus.
7 890 V. G. Murray. Electro-magnetic locks. (19/3/21, British India.)
7 893 J. C. N. Graafland. Radio-electric relay and electric signalling. (23/9/21, Holland.)

March 18, 1922.

7 902 R. MacGregor & F. W. Raisin. Self-propelled floating electric power station.
7 933 S. J. Levi & H. Rottenburg. Portable electric standard lamps.
7 939 S. O. Cowper-Coles. Zinc cylinders for primary batteries.
7 947 Metropolitan-Vickers Electrical Co. & T. Ferguson. Control of electric motors for traction.
7 969 B. T.-H. Co., H. W. Taylor & K. R. Hopkirk. Electric machines.
7 970 B. T.-H. Co. (G. E. Co.). Alternating current machines.
7 987 R. Dell. Controlling railway signals of the electric light type.

March 20, 1922.

8 007 R. Bosch Akt. Ges. Electric hooter. (17/10/21, Germany.)
8 011 F. Addie & A. G. Hartley. Electric control gear.
8 026 T. J. Hedley. Materials for use as electric conductors.
8 036 W. H. Slaughter, E. R. Beckwith & H. T. Hall. Electric couplings.
8 056 N. A. Block & J. W. Coward. Coil ignition systems for internal combustion engines.
8 064 I. Calvete. Remote control switches.
8 066 A. F. R. Cotton & E. W. Russell. Conversion of musical sounds into electricity, or vice-versa.
8 078 Wireless Speciality Apparatus Co. Electric condensers. (30/3/21, U.S.)
8 081 J. Stone & Co. & A. H. Darker. Train lighting dynamos.
8 082 W. B. Sayers. Electric machines, &c.

March 21, 1922.

8 115 C. J. R. Alsford & E. F. Turner. Oscillating circuits.

CONTENTS.

Notes of the Week.

Sir John Benn.

It is with the greatest regret that we have to record the death of Sir John Benn, Bart., chairman of Benn Brothers, Ltd., the proprietors of The Electrician. Sir John, who was in his seventy-second year, died early on Monday morning after a short illness. Though the close touch which he has maintained with electrical matters through the medium of The Electrician has only been of a few years' duration, his connection with the industry which we serve is of a much more ancient character. He will be remembered as an ardent supporter of municipally owned electric trams for London, and it is largely owing to his energy and enterprise that a wide network of communication is now spread over so much of the metropolis. Had Sir John fulfilled his desires the network would have been wider, but for many years his party in the County Council was not in power, and those who have controlled these matters, both in that body and in Parliament, have been averse to the extensions which he would himself have pushed forward. In non-electrical matters, such as housing, welfare measures, and sanitation, Sir John's influence was wholly towards the goal of better municipal government in London. His long experience (at the time of his death he was Father of the County Council) was of the greatest use both to his colleagues and to the officials, and it is not too much to say that the London of to-day is largely his creation. London, therefore, will miss him, but those of us who knew him as a chief and a leader will miss him much more.

Automatic Signalling Progress.

The part that electricity can play in handling an increasing railway traffic in a more efficient and more expeditious manner than by steam working is emphasised by implication in a Paper read by Mr. W. Willox before a recent meeting of the Institution of Civil Engineers. An abstract of this Paper will be found on another page of this issue. As is well known, the high acceleration of the electric motor makes it possible to run trains on a shorter headway than is possible with the steam locomotive. On the other hand, a shorter headway necessitates an increased number of signal movements in a given time, and therefore practically imposes the use of automatic methods of control in place of the older manual system. The order of these increases is well illustrated by the figures given by Mr. Willox for the Metropolitan Railway. In 1905, when electric traction was first used, the number of trains between Praed-street Junction and Aldgate (the busiest section) was 621 per day on both roads, with 49 signal sections, while in 1913 the number of trains was 863 between these two points and no less than 983 between Baker-street and Aldgate (owing to trains coming in from the Aylesbury extension), with 91 signal sections.

A Record of Success.

The design and installation of equipment for successfully controlling this enormous traffic naturally required a great deal of thought and careful workmanship, which are reflected in the details given by Mr. Willox. No less is it reflected in the small number of failures incurred, almost all of which were due to the operation of the train stops and so caused but a short delay. Only once has a signal failed to return to the danger position, and if such a thing should happen again the signal in rear would go to danger in its turn and remain there, so that safety is practically assured. But there is more than this to be said. For, as Mr. Willox points out, automatic signalling, besides having the traffic advantages detailed above, also means a direct saving in wages, about £325 per annum being the order of the economies on the Metropolitan. It is interesting to note, moreover, that both a.c. and d.c. are used for operating the

signals, a.c. track circuiting being, naturally, used throughout. It would be useful to have comparative figures of the operation of the two sets of equipment, and we hope these may be made available so as to render the history of an interesting piece of work complete.

Standardisation—Pros and Cons.

It might be argued that on the balance standardisation, whether we consider its broad, underlying principles or its practical results, has as many disadvantages as advantages. In the electrical industry we have recently had a striking example which falls within the former class, and doubtless others could be found without much trouble. In general engineering, on the other hand, where design and manufacture are more stabilised, the advantages probably outweigh the disadvantages, as was convincingly shown by Mr. C. Le Maistre in a Paper read recently before the North Coast Institution of Engineers and Shipbuilders. Mr. Le Maistre quoted Mr. H. J. Skelton to the effect that the savings effected in the production of rolled sections had reduced the costs of production by £100 000 per annum. Even in 1914 95 per cent. of the sections rolled at the five largest steel works in the kingdom were British Standard Sections, while the tramway rail sections had been reduced in number from 75 to 5. These examples indicate two of the many directions in which, from the consulting engineer's, the buyer's, the designer's, and the manufacturer's points of view, standardisation is a real economic advantage.

Excellent Voluntary Effort.

Mr. Le Maistre righly congratulated the industry on the organisation of the Standards Association. It is, as he pointed out, practically a voluntary body, both as regards financial support and expert assistance. Without wishing to be ungracious, however, it may be emphasised that expenditure of this kind is really an investment and not a charity, and must be returned many fold. For the work of examination and recommendation which the Association undertakes after due external pressure enables the ground to be cleared in a way that makes cheaper production possible. It must be emphasised, too, that this spade work is carried on with the assistance of every section of the industry, and how widespread that assistance is may be gathered from the statement that there are now no less than 385 committees, sub-committees, and panels engaged in the work of initiating or amending standards. The main committee itself does not initiate standardisation, but waits for pressure from outside, and then calls a representative conference to ascertain whether there is general agreement as to the need for fixing an official standard. In this way the industry regulates the advance and false steps are avoided. This good work is likely not only to continue, but to expand for the general benefit.

Temporary Expedients.

There is a right appliance or an appropriate tool for every job in engineering. And if new apparatus is developed new tools are devised for its manufacture. But every engineer encounters jobs that have to be performed when appropriate tools or appliances are lacking. A consideration of the expedients that then have to be adopted formed the subject of comment in a useful Paper read recently by Mr. W. E. Highfield before the National Association of Supervising Electricians. The case of a new generating station was taken as an example. Here the constant arrival of goods, not always in perfect condition, on a site which may be in a state of chaos, calls for method and ingenuity on the part of the engineer-in-charge. If he has heavy machinery to install, it pays him to lay a good road from the railway-siding to the site, and this can be conveniently constructed from sleepers or lengths of heavy timber. Hints were also given on the use of jacks and cranes and the levelling of bedplates. Lining up by the aid of spirit-level and a stretched steel wire as a test of alignment is important, and care should be taken that middle bearings take their share of the weight. Hydraulic gear is preferable for pressing on shafts as the pressure can be measured. On no account should the hub be heated to get the shaft on, this expedient being left for future withdrawal.

Drying Out Insulation.

Mr. Highfield also gave some useful advice on drying out insulation. Foundry core ovens, he said, were unsafe, as the heat may greatly exceed a safe value. Transformer oils were best dried in the tank by the aid of a few standard tramway resistance grids. Balancing engines was at once a highly necessary and difficult problem. Finally, some hints were given on emergency repairs. Problems of this kind form a good test of the resource and practical efficiency of an engineer, and one of the first lessons a man on installation work has to learn is the art of doing without useful and customary tools and apparatus. The practical advice given in this Paper is well worth attention not only by engineers-in-charge, but by engineers generally.

The Lighting of Public Buildings.

At a recent meeting of the Illuminating Engineering Society a detailed account of the installations in a number of public buildings was read by Messrs. E. H. Rayner, J. W. T. Walsh and H. Buckley, of the National Physical Laboratory. Sixteen installations in all were dealt with. Semi-indirect lighting seems to have been generally used, and the illumination recorded varied from 2·9 to 4·7 foot-candles, the general standard being thus considerably in advance of that customary a few years ago. To obtain 3 foot-candles, the minimum aimed at, consumption of energy varying from 0·38 to 0·63 W per sq. ft. were recorded. One good feature of the installations is the care devoted to the screening of filaments, glassware being used to diminish the brightness to quite a moderate figure (0·6 to 2·5 c.p. per sq. in.). While the discussion revealed some differences of opinion on certain points—for instance, the wisdom of the general adoption of semi-indirect methods—the measures taken in these installations appear to have been such as to ensure adequate lighting, and the data therefore form a valuable record. We wish that the illumination of public offices was always planned in such a thorough manner, and it is interesting to observe that a new building, especially designed for experiments in illumination, is being erected at the Laboratory.

Lighting Decorative Interiors.

Following the account of this work in public offices, another aspect of the subject, the lighting of more or less decorative interiors, was dealt with by Capt. J. W. Liberty, Public Lighting Inspector to the City of London. A number of photographs, taken by Mr. J. S. Dow entirely by the artificial light provided in each installation, were shown. In many cases pleasing effects were illustrated, one striking view being a passage leading to the Council Chamber at the Marylebone Town Hall, where the lighting is effected by concealed lamps placed in a dome, situated between pillars. It would appear from the ornate character of the decoration in many of these rooms that expense has

not proved a deterrent factor, and we should, therefore, expect lighting of an imposing kind. On the other hand, decorative aspirations are not always favourable to illumination. For instance, when walls are panelled in very dark walnut the contrast between the brightness of the lighting, the fittings, and the surroundings imposes great difficulties on photography, and is probably not desirable for eye comfort. A complete contrast to these methods is afforded by the main office at the Port of London Building, now in course of completion. Here lamps totalling 20000 c.p. are assembled in a vast white dome. This gives an excellent diffusion of light, and the installation, when completed, should be worth a visit. In decorative interiors it is natural that the architect should have a considerable voice in the lighting arrangements, and we do not wish to restrict his methods unduly by insisting on purely technical consideration. Nevertheless, in rooms that are used as offices, for meetings of committees, councils, &c., utilitarian aspects must be considered, and there is occasionally a tendency for undue weight to be attached to the decorative side of the problem. The Illuminating Engineering Society, in promoting this joint discussion with the R.I.B.A., has, we hope, exercised a useful influence in favour of a balance being struck between these considerations.

Tramway Change-Over Arrangements.

If we are to judge by the letter which we publish in our Correspondence columns to-day, Mr. M. J. E. Tilney is of the school that believes there are some things which "they order better in France." Paris, he points out, is not only in the throes of tramway reconstruction, but it endures, as we do in London, more than one system of tramway operation. Some means of easily and quickly changing over from one system to another are therefore necessary, if through running is to be possible, and, from the details that Mr. Tilney gives, it seems that the London tramway undertakings have something to learn from the Paris tramways authorities in this respect. We are inclined to agree with this view; as there seems no reason why the pre-historic, man-handled apparatus, which may be seen in use where the conduit is replaced by the overhead system—*e.g.*, at Highgate—should not be replaced by some simple, mechanical or electrical device which could be easily operated and save both time and labour. The probable answer to the question propounded by Mr. Tilney in the last paragraph of his letter is that capital expenditure stands in the way. At the same time, in these labour-saving days the advantages and disadvantages of the apparatus which Mr. Tilney describes might well be examined to see whether its adoption is not possible.

The Circle of Delimitation.

The draft of the Brentwood Electric Lighting Special Order recently issued by the Commissioners exhibits a new method of determining an area over which statutory powers are sought. Generally, the area in such Orders is coterminus with some existing boundary, and this is a ready and practical means of delimitation. But the promoters of the Brentwood Order have invented another method. They have disregarded every existing boundary and have specified simply that the area shall consist of the plot which lies within a circle whose radius is two miles from a particular spot in Brentwood. A circular area like this certainly has the advantage that anyone can mark it out for himself on a map. On the other hand, when it comes to practice this simplicity disappears and many difficulties simultaneously arise. To determine such an area *in situ* is by no means easy. It cannot be done direct as when parish boundaries, which are known to all and sundry, are picked out. To find just where this hypothetical circle actually runs is only possible by the use of a large scale ordnance map and from calculations made on the spot. In a rural area like Brentwood it is, perhaps, more tedious than difficult, but would be a very awkward matter in a district entirely built over. We hope this example of ingenuity will be the last.

The Plaint of the Passenger.

We have the highest authority for the statement that to every action is an equal and opposite reaction, and this is equally true in many other spheres than the purely physical. The latest example is to be found on the London Underground Railway, where the laudable efforts, from the management's point of view, to prove by poster and assertion what a wonderful service is being provided is being counteracted by suggestions that improved facilities would be really more welcomed by the public than this wealth of illustration based largely on supposition. We hear, nay, we all experience too often, the doubtful joys of using lifts which will miss trains, of travelling in connecting trains that do not connect, of hanging suspended from straps when we have paid for seats, and of enjoying the conversation of officials whose language recalls that of the cowboy of fiction. Could only a few of these drawbacks be removed we would gladly forgo even Mr. Heath Robinson's pictures of what an ideal Underground should be.

The Domestic Load and Thermal Storage.

The domestic load is at once an opportunity and a nightmare to the electricity supply engineer. He sees in it a chance of expanding his output and revenue, but is a little fearful of risking capital, as it must be risked, which will not become immediately productive. From the consumer's point of view, and from the engineer's, too, for that matter, electricity as a domestic aid has the disadvantage that it is not, as at present used, a means of providing that cheap and abundant supply of hot water which is a necessity in every household. It may be noted that it shares this disability with gas, and that therefore some sort of coal-heated boiler must be installed. This installation rather cuts at the roots of the all-electric home of which we dream, and it therefore behoves electrical engineers to seek a solution of the hot-water problem. Thermal storage seems to offer that solution. It is not a new idea—indeed, to some it is an exploded idea. But its past failure may be written down to its infancy, and there is no reason why ultimate success should not be gained. The thing to remember is that it is not a small quantity of very hot water that is required in the house, but a large quantity of warm water.

Trackless Trolley Results.

Those tramway engineers who are flirting with the trackless trolley system will be interested to read an article which recently appeared in the "Elektrische Kraft Betriebe und Bahnen," giving the results of ten years' experiences with a system which had been in operation between Hamburg and Marienhohe. The run was 2½ km. each way, the cars weighed 3 150 kg., and could carry 12 seated and 10 standing passengers. The wheels were fitted with solid rubber tyres, and the cars were driven by 15 h.p. motors with a silent worm drive. The trolley was pivoted on the roof

of the car in such a manner as to give a free swing through a full circle, so permitting the car to deviate as much as three metres from the route. The author of the article makes the following claims for the system: That the operating costs, including depreciation and renewals per passenger carried is the same as for rail traction; that the building cost of the trackless trolley system is only a third of that for the ordinary tramway; while the wear and tear on the road is less with the trackless trolley system, and the traffic obstruction is also far less. If this be so there is much support with the author's view that in the majority of cases it would be possible to install a trackless trolley system over existing well-kept-up roads with a minimum of invested capital and a maintenance cost about equal to that of the ordinary tramway.

The Electricity Supply Bill.

Unexpectedly good progress has been made with the Electricity Bill in the House of Lords. For, notwithstanding sixteen pages of amendments, numbering sixty in all, two days sufficed for the proceedings in Committee, and the Report stage was taken on Tuesday. The result is that the measure in its amended form now stands a reasonable chance of being passed this session. The alterations made are not so extensive as at one time we feared might be the case; and with one or two exceptions they do not appear to be of a vital character. Perhaps the worst part of the business was the way in which the speeches of many of the noble lords betrayed not only woeful ignorance but a total disregard of the interests of the supply industry. If some of them had had their way, in fact, each scheme for the organisation of a district would have to run the gauntlet of Private Bill procedure, with its heavy expense and its attendant worries and uncertainties, a course which is without any advantage except to the obstructionists. Fortunately, also the Minister in charge (Viscount Peel) resisted a proposal which was embodied in the foolish amendment of Lord Askwith to exclude local authorities from the category of those who could give financial assistance to Joint Electricity Authorities.

Convenient Forgetfulness.

The noble legislators seemed, indeed, to have forgotten that the provisions of the Bill are entirely permissive, and not compulsory in character, and that Joint Authorities are not to be exclusively entrusted with the reorganisation of electricity supply. In some areas, such as North Wales and the South-West Midlands, power companies will be in a dominant position, and in the remainder of the country, which has been provisionally determined into electricity districts, companies will have equitable representation on any authorities that may be formed. Moreover, orders setting up Joint Authorities must be approved by both Houses of Parliament, and yet noble legislators spoke as if none of these safeguards existed. The majority seemed to be actuated by a spirit of antagonism to municipal trading, and by a fear of increased rates, which quite destroyed all their usual sense of logic.

Amendment of the Bill.

To placate these critics, concessions were made by Viscount Peel. In the first place, local authorities with a population of less than 50 000, who are not authorised undertakers, were excluded; in the next place, the liability of other councils who are not undertakers is limited to a penny rate; and, finally, those municipal councils who are undertakers will not be called upon to meet more than the estimated annual amount of any capital charges, from which they will be relieved by taking a supply of electricity in bulk from the Joint Authority.

It may not be easy to make the last-mentioned calculation, but inasmuch as we believe Joint Authorities will be able to function without rate-aid, the point will not arise in practice. A new clause was inserted authorising a Joint Authority to take a lease of the whole or any part of the undertaking of authorised undertakers, and slight modifications were made in Clause 8 relating to the use of main transmission lines by Joint Authorities, and in Clause 10 relating to wayleaves.

Suspension of Purchase Powers.

An important new clause is one authorising the suspension of the purchase powers of the Joint Authority, London County Council, or local authority, provided consent to such suspension has been obtained. As the precise form of the clause could not be agreed to, it was postponed to the Report stage. This is an important amendment of the existing law, and will go far to remove the obstacles to the formation of a Joint Authority in the Greater London area.

A new clause, amending Sec. 12 of the 1919 Act, was also accepted, and provides full protection for power companies where an additional demand arises in any part of their area. Some alterations were made in Clauses 14 (revision of prices, &c.) and 16 (power of persons not being undertakers to supply electricity), and after an unsuccessful attempt had been made to amend Section 16 of the principal Act, which provides compensation for the loss of office, the remaining clauses were passed, certain amendments being reserved for the Report stage.

The Removal of Objections.

It will be seen that, while the main provisions of the Bill as introduced into the House remain, the alterations made should go far to remove the objections of the power companies as enunciated in their recent pronouncement. Many of these companies have rendered signal service to the industry, and no one desires to see them deprived of any advantage which their enterprise and energy have secured. We cannot, however, appreciate their claim that, while no local authority or County Council within the area of a power company should be allowed to give financial assistance to a Joint Electricity Authority, they should be enabled to participate in the financing of the power company. We cannot see the reason for this differentiation, and we hope that the Legislature will not adopt the suggestion. It must be remembered that power companies' areas do not cover the whole of the country. Joint Authorities will be occupied with the generation and supply of electricity at as near cost as possible, and we hope and believe that they can do this more cheaply than the existing undertakings. Local authorities (and supply companies, too), where they are undertakers, will be quasi-partners in the authority; they will be concerned with the retail distribution of the electricity they receive in bulk, and though the present Bill places limitations upon their liability on account of any financial assistance they may give to the authority, they may make a profit out of the supply of electricity. In many cases local authorities are as likely to get electricity as cheaply from a Joint Authority as from a power company, and, therefore, it would be as advantageous to them to support the former as the latter.

Speaking With One Voice.

The final informal meeting of the present session of the Institution of Electrical Engineers may be said to have been distinguished in two ways. The first was that, in spite of the high interest of the subject for discussion: "The Importance of Considering Finance in Electrical Undertakings," the attendance was small, and therefore the spectacle of two famous members attempting, somewhat inarticulately, to propound plans for the construction of a new electricity supply industry was observed by but a meagre audience. The excuse of those who were not present might well be: Why put forward plans for such a reconstruction in such a way? That is the second surprising thing. For though both speakers accorded praise to the work of the Commissioners, they implied that that hard-working body are ploughing the sands, and that unless we revert to undiluted private enterprise in every sense of the word we shall soon have to set about reaping the whirlwind. The electricity supply industry in this country, they both would have us believe, is in a bad way; and unless we are careful will never be anything else. Here is more than sufficient food for thought, and we are not surprised that the discussion was a little ill-sustained.

Rectifying Old Defects.

The opener of the debate, Mr. Arthur Wright, admitted that the Government was endeavouring to rectify some of the old defects which have prevented the development of the industry in the past. But he went on to say that nothing was being done to remedy the real cause of our backwardness, the continual discouragement of private capital and enterprise from entering the electricity supply field. Though the Commissioners were doing a great deal to consolidate electricity supply areas, no one had discovered the source whence would come the enormous amount of capital required to carry out the extensive development foreshadowed, and without that capital there could be no real development.

Private Enterprise the Sole Solution.

Further, Mr. Wright argued, only private money and enterprise could be relied upon to achieve the necessary progress, and this would not be forthcoming unless the financiers who provided it were assured of the entire control of their expenditure. Ratepayers, too, would not allow the rates to be mortgaged for enterprises operating mainly outside their own towns, enterprises in which they would not have the sole voice in questions of management and policy. With these arguments Mr. Highfield expressed his hearty agreement. The solution of our present difficulties must originate, he said, from the industry itself, and it must tell the politicians with one voice what the right line to take was.

Whose Voice?

Now it is quite open to Mr. Arthur Wright and to Mr. Highfield to hold the opinion that private enterprise is the best, and indeed the only way of developing the electricity supply branch and so the electrical industry at the present time. Recently we expressed much the same view, and it is also widely held in other quarters. We are also of the opinion that it is desirable that the electrical industry should speak with one voice in this as in other matters. The difficulty is how to square what is desirable with what is possible, and especially are we doubtful at the present time that if the electrical industry did speak with one voice that voice would be the voice of Mr. Arthur Wright and Mr. Highfield. Manufacturing interests, for instance, are anxious to move forward without delay and see in the support of the Commissioners the best way of doing this.

Past History.

If we retrace our steps with Mr. Arthur Wright into the past history of the electricity supply undertakings we do not find that enterprise was or is the entire prerogative of the companies. Considering the conditions under which they have had to work perhaps it is not altogether their fault, but that does not alter facts. To deal purely with finance the municipalities have, in general, supplied electricity more cheaply than private enterprise, and have done so with advantage rather than disaster to the undertakings they own and to the ratepayers who have backed them. These municipalities have encouraged the development of both the power and domestic loads, the show-room idea and the more technical advances in a way which the companies have often either not cared to do or have not been successful in doing. Moreover, until about ten years ago financiers were shy of the electricity supply industry, as represented by the private enterprise, and even the fact that money can now be more easily obtained at a high interest is not on Mr. Wright's own showing necessarily an encouraging sign.

The Brighter Municipal Prospect.

On the other hand, money raised on the security of the rates has generally been easy to obtain at a low interest, and even now flows in in a stream of gratifying volume when it is required. So that on the financial side the promise is apparently brighter for electricity supply when it is under municipal than when it is under private control. If, therefore, we tabulate the arguments for and against the official methods of reorganising the electricity supply of the country, and similarly tabulate the arguments and results for and against handing over the whole of that great development to private enterprise, we find, remaining as unbiassed as we possibly can in the meantime, that there is at least as much to be said for one course as the other; that there is at least as great a weight of opinion on one side as the other, and that municipal management of electricity supply is usually as enterprising as when the conduct of affairs is in private hands.

A Comparison for Example.

In another branch of human affairs at the present time where much active disagreement is found as to the best solution to adopt each side emphasises its desire for peace and promises to give up warfare—directly it gets what it wants. The parallel is rather close to the matter now under discussion. For both Mr. Arthur Wright and Mr. Highfield stress the importance of the electrical industry speaking with one voice, and we agree that it is most important that there should be one voice. But we find on examination that it is to be their voice with which they wish the industry to speak, and it is not surprising therefore to discover a reluctance among municipal electrical undertakings to sink their individuality in quite so wholesale a way. Neither do we quite see why they should. For with friendly rivalry real progress will come from real co-operation, whose foundation the Commissioners are working hard to lay. A real co-operation means each side working together, not one side dominating and the other side blindly following.

A Simple Generator of High Frequency Current for Measurement Purposes.

By J. M.

Postulating the importance of high frequency measurements in modern radio researches, the author goes on to detail the requirements of a generator of high frequency current for this class of work and to describe apparatus which has actually been used for the purpose. Examples of the measurements that have been undertaken are also given.

The use of a small oscillating arc for making measurements at high frequencies is by no means novel, and in fact the type now to be described has been used for this purpose for several years. Its proved usefulness, however, is such that it deserves to be more widely known, and these notes are written to that end. After a brief description of the construction of such an arc, the important conditions for its stable operation are outlined and three examples are given with full values of the constants of the various circuits employed.

The Importance of High-Frequency Measurements.

In the solution of everyday problems in high frequency engineering the experimental method has necessarily to be used to a much greater extent than when dealing with continuous currents or alternating currents of low frequencies. The increase of frequency makes prominent a number of additional factors in the electrical circuit and greatly complicates calculation, so that although measurements are also less simple at high frequencies they are usually more practicable than direct calculation.

Moreover by making certain measurements at the correct frequency, but at reduced power, it is often possible to obtain results of sufficient accuracy by further calculation.

Requirements of a Generator of H.F. Current for Measurements.

The lower limit of power is chiefly determined by the energy consumption of the measuring apparatus. This energy consumption ought to be practically negligible in comparison with that of the circuits in which the measuring apparatus is inserted, and the latter should itself be small compared with the power of the generator.

A generator capable of delivering 30 W of high-frequency energy, over a large range of frequencies, is sufficient for a very considerable number of measurements, in fact its sphere of usefulness may be compared with that of a battery in direct current measurements. In conjunction with such a generator, portable hot wire instruments, or thermo-couples with direct-reading moving coil instruments, may be used.

Since the invention of the Poulsen arc a number of types of small

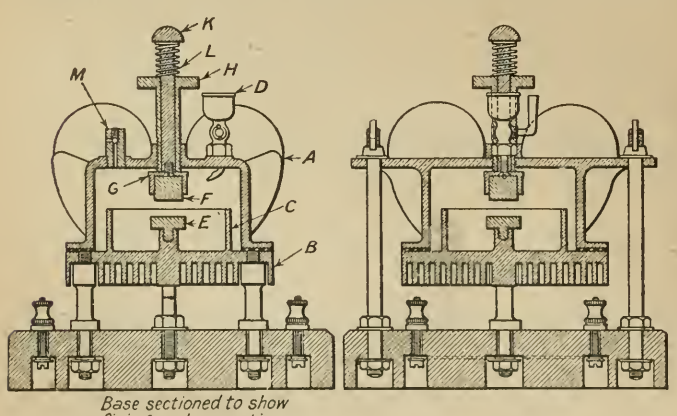

Fig. 1.—Sketch of Type "O" Arc.
C. F. Elwell, Ltd., London, Makers.

power arcs have been constructed by different experimenters with the object of obtaining not only a pure sine wave form and constant frequency, but also uniform amplitude.*

A small arc of this kind has advantages over a triode valve as a generator of oscillations, inasmuch as it is extremely simple and compact; its life is indefinite and there is nothing to get out of order; it is unbreakable and renewals of electrodes (which last a long time) are very cheap; it requires no special sources of supply, but can be run off an ordinary direct-current supply at 110 V or more. At the same time, it is possible to obtain from the small arc, provided suitable circuits are employed, the necessary power over a wide range of wavelengths, with a stability amply sufficient for many practical purposes.

* Zenneck—Wireless Telegraphy. Vollmer—Schwankungen der Frequenz und Intensität in der Lichtbogenschwingungen. Jahrb. de Drahtl. Telgr. 3, p. 117.

Details of Construction.

In the case of the small arc illustrated in Fig. 1, it has been found possible to simplify the apparatus without detriment to its satisfactory operation by dispensing with the magnetic field and water-cooling used in the larger Poulsen arcs, while a suitable atmosphere is produced by pouring into a dish surrounding the anode a little alcohol, which is vapourised by the heat of the arc. The arc is instantly struck, and works for long periods without adjustment. It is enclosed under a bronze cover A, having fins for effective air-cooling, which is bedded, with a joint on to a ring B, mounted on an insulating base. With the ring B is cast dish C which is fed with liquid alcohol from time

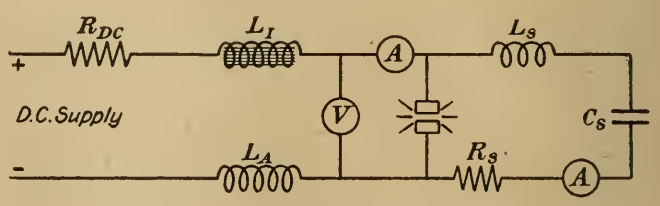

Fig. 2.

to time by the funnel and cock D; fixed to the centre of C is the copper anode E. The carbon cathode F, which is of sufficient section to ensure its uniform wear without the necessity of rotation (as in larger Poulsen arcs), is held in a carbon holder G, the stem of which passes through a hollow adjusting-screw H, and terminates in a knob K. The spring L keeps the carbon holder G up against the lower end of the adjusting screw H by means of which the gap between the anode and cathode is regulated; the arc is struck by pressing K momentarily. In the cover is a small relief-valve M. Two pairs of terminals, marked + and − are connected to the anode and cathode respectively, one pair for the d.c. supply, and the other for the oscillatory circuit.

Fig. 2 is a diagram of connections. The resistance R_{DC} in the d.c. supply circuit should, generally speaking, have a value such that the voltage drop across it should be at least equal to that across the terminals of the arc itself. The iron-cored choke coil L_I of about 0·1 henry, helps to steady the supply, especially when this is from accumulators, and the air-cored chokes L_A protect the d.c. supply circuit against high frequency in cases where the latter might cause trouble, although the H.F. voltage is never likely to exceed a few hundred volts.

The arc can deal with about 120 W d.c. continuously, without excessive heating, or with rather more for short period. The d.c. supply current is about 2 A, and the voltage across the arc between 50 and 100 V. The oscillating current should have a value equal to $\frac{1}{\sqrt{2}}$ times that of the d.c. supply current, and this condition will be obtained when the inductance L_S capacity C_S and resistance R_S of the oscillatory circuit have suitable values.

$\sqrt{\frac{L_S}{C_S}}$ should be greater than 100 O, and the value of R_S as large as possible compatible with the maintenance of the arc, which goes out if R_S exceeds a certain limit; the correct ratio $\left(\frac{1}{\sqrt{2}}\right)$ of oscillating current to d.c. supply current will then be obtained, and at the same time a good H.F. output, with pure wave-form and constant amplitude and frequency. The latter will be very close to the natural frequency of the oscillatory circuit, and its constancy will be improved by keeping the capacity C_S small.

When the arc is working on the true Poulsen cycle, with the ratio $\frac{\text{H.F. current}}{\text{direct current}} = \frac{1}{\sqrt{2}}$, the arc is extinguished once per period and re-ignited at the moment when the charge of the condenser has reached the voltage required to jump the arc gap. Now, the interval between extinction and re-ignition is the least well-defined portion of the period, and the shorter this interval is made, the more constant

will be the length of the period. The smaller the capacity of the oscillatory circuit, the more quickly will it be charged up to the ignition voltage, the shorter will be the interval of extinction and the steadier the frequency.

Very good results are obtained for frequencies varying between 15 000 and 100 000 periods. Between 100 000 and 300 000 the oscillations are a little less pure, but it is still possible to carry out over this latter range, a large number of measurements in which purity of wave form and constancy of frequency are not of great importance. A number of working points are shown in the table.

Table of a Few Working Points of the Arc.

The supply volts should be about twice the volts across the arc.

Oscillatory Circuit.			Supply.		Remarks.
λ Metres.	C μ Fds.	R Ohms.	Volts across Arc.	I Amps	
780	·001	4	58	2	
1 500	·001	5	65	2·1	
2 000	·0035	3	82	1·8	
2 000	·00175	7	70	2·2	
2 000	·0035	8	80	1·85	
2 000	·0035	13	96	1·7	Arc overloaded.
2 450	·002	8	90	1·65	
2 500	·001	5	80	1·75	
3 100	·0014	7	71	2·1	
3 300	·00175	7	77	1·7	
3 700	·007	7	75	1·6	
4 950	·0035	7·5	80	1·7	
5 900	·007	14	115	1·15	
13 000	·0105	15	100	1·8	Arc overloaded.

The curve in Fig. 3 shows an example illustrating the extent to which the wave length of the oscillations may fluctuate when the same frequency is obtained with different values of the capacity of the condenser.

The Use of the Small Arc.

Among the measurements for which the small-power arc is suitable, the following may be mentioned:

High frequency resistance of conductors, inductances and capacities. High frequency tests of dielectrics and condensers, by the use of suitable step-up high-frequency transformers. Calibration

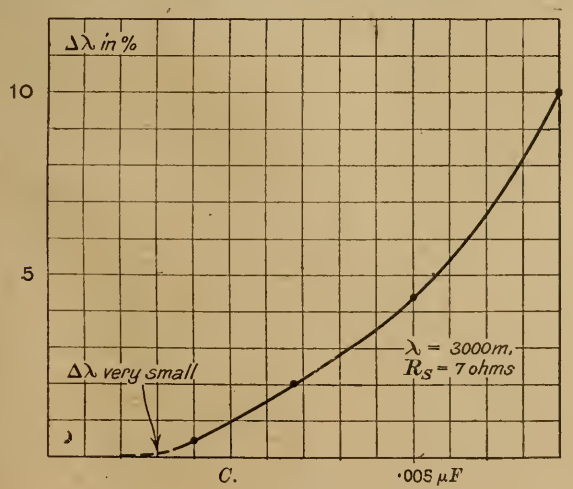

Fig. 3.

of high-frequency ammeters, for currents up to about 30 A, using suitable step-down transformers, and measurement of antennae constants, lecture demonstrations of resonance phenomena, &c., &c.,

Detailed Measurements.

The following examples of some measurements actually carried out with the type of arc generator described and illustrated above may be found useful:

Example 1.—Measurement of a non-inductive resistance wave-length, 4 500 metres (Fig. 4).

Circuit Constants.

Arc Supply Circuits:

Supply voltage—140 V.
Voltage at arc terminals—80 V.
Series resistance—17·5 O.
Supply current—1·75 A.

H.F. Circuits.

(λ=4 500 m.; $\omega = 2\pi f$ = 419 000).

Circuit No. 1.

Inductance Coil L_1.—83 turns, wound in a single layer on a wooden cylinder.

Diameter of turns—20 cm.
Number of turns per cm.—1·4.
Wire—No. 27 SWG. D.C.C.
High frequency resistance for = 4 500 m., 10 O. approx.
Inductance—1 830 microhenrys.

Coil l_1—Square single-layer coil, 10 cm. side.
Total number of turns, 20; several taps.
Turns per cm. = 1·4.
Wire—No. 27 SWG. D.C.C.

Condenser C_1—3 millimicrofarads.
i_1 = 1·2 A.
$L\omega$ = 767 O.
$L\omega I$ = 924 V.
Power absorbed by the circuit, 15 W. approx.
Coupling between the circuits No. 1 and No. 2.
M_1 = 2 microhenrys.
$M_1\omega$ = 0·84 O.
$M_1\omega I_1$ = 1 V. (E.M.F. induced in circuit No. 2 by circuit No. 1)

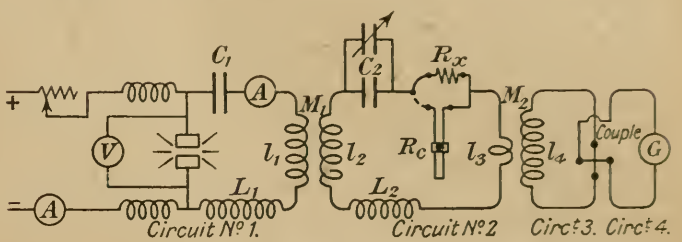

Fig. 4.

Circuit No. 2.

Inductance Coil L_2.—21 turns, wound in a single layer on a wooden cylinder.

Diameter of turns—20 cm.
Number of turns per cm. 1·4.
Wire—No. 27 SWG. D.C.C.
High frequency resistance for λ = 4 500, of the order of 7·5 Ohms.
Inductance—275 microhenrys.

Coil l_2—Square coil, 9 cm. side.
Number of turns, 5 (in a single layer).
Wire—No. 27 SWG. D.C.C.

Two turns are used, giving an inductance of one microhenry This coil was placed inside coil l_1 it was turnable about its diameter.

Coil l_3.—Same as coil l_2.

Capacity C_2 consists of a fixed condenser in parallel with a variable condenser. Total capacity at resonance — 0·0 208 microfarads.

Resistance R_x *and* R_c.—R_c consisted of constantan wire, 20 O, per metre two parallel strands of which were wound close side by side, the length of wire in circuit being varied by a sliding contact. The resistance was varied until the substitution of R_c for the unknown resistance R_x produced no variation of current in the circuit. The value of R_x found by this measurement was—2·8 O.

i_2 = 0·2 A.
$L_2\omega$ = 115 O.
$L_2\omega I_2$ = 23 V.
Power absorbed by the circuit—about 0·3 W.
Coupling between the circuits (2) and (3).
M_2 = 1·2 microhenry.
$M_2\omega$ = 0·5 O.
$M_2\omega I_2$ = 0·1 V.

Circuit No. 3.

Coil l_3—same as Coil l_1.

Coil l_4—was movable inside coil l_3.
Resistance of thermo-couple, 10 O.
ωl_4—10·5 O.

$$I_3 = \frac{M_2\omega I_2}{\sqrt{R^2_{\text{couple}} + \omega^2 l_4^2}} = 7 \text{ mA.}$$

Power absorbed by the circuit, about 0·5 milliwatts.

Circuit No. 4.

Resistance of thermo-couple, 10 O.
Difference of potential at the terminals of the used thermo-couple fc. a heating current of 10 mA. 2·2 mV.
Galvanometer resistance, 8 O.
Galvanometer constant, 100 divisions = 120 microamperes.
For I_3 = 7mA. the difference of potential at terminals of thermo-couple is 1·08 mV.

$I_4 = \frac{1{\cdot}54 \text{ mV.}}{18 \text{ ohms.}}$ = 60 microamperes. The galvanometer thus gave a deflection of 50 divisions when the unknown resistance R_x was inserted in circuit No. 2.

It can be seen from the data given above that the couplings between the coils were very loose and the power absorbed by the succeeding circuits diminished rapidly. Re-action between circuits was quite negligible. The power furnished by the arc permitted of accurate measurements being made.

Example 2.—Measurement of the resistance of an inductance coil. Wave-length $\lambda = 4\,500$metres.

The resistance to be measured was of the order of 10 O., and the inductance of the coil about 2 100 microhenrys.

The same circuits as Fig. 4 were used except for circuit No. (2).

Constants of circuit No. (2). (See Fig. 5.)

Coil $L_2 = 2\,900$ microhenrys.

Capacity C_2, variable *air condenser*, of 1·96 millimicrofarad.

$R_c = 6$ O.

Coils l_2 and l_3 similar to those described in the preceding example, except for re-adjustment of the coupling M_1 and M_2.

Procedure.—On short circuiting the added resistance R_c the galvanometer gave a deflection of 100 divisions. On inserting R_c the deflection was 43 divisions. Consequently :

$$\frac{R_x + R_c}{R_x} = \sqrt{\frac{100}{43}} = 1{\cdot}525, \text{ from which}$$

$$R_x = \frac{R_c}{0{\cdot}525} = 11{\cdot}5 \text{ O.}$$

The losses on the coils L_2' and L_2'' and the condenser C_2 may be

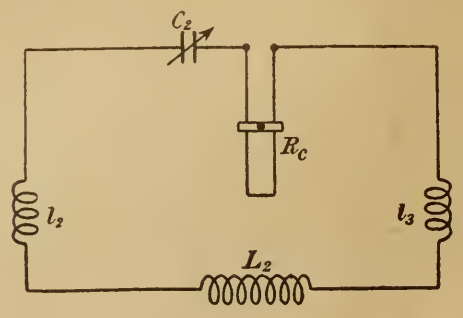

Fig. 5.

neglected. The reaction between the circuits is stronger here than in the first example, but the resulting error is still quite negligible.

Example 3.—*Calibration of a High-frequency Ammeter.*

Standard ammeter—

Full scale reading—35 A.
Resistance—0·009 O.
Inductance, between the terminals, of the order of 0·1 microhenry.

Ammeter to be calibrated—

Full scale reading—30 A.
Resistance—0·01 O.
Inductance between the terminals, of the order of 0·1 microhenry.

Circuit Constants and Calibration Conditions (Fig. 6) = 2 200 metres.

Arc Supply circuits—

Supply voltage—220 V.
Supply current—2·15 A.
Resistance R—57 O.
Voltage across terminals of the arc—98 V.
Power absorbed by the arc, 210 W.

(The arc was in this instance somewhat overloaded, but it would stand this for the short period required to carry out the calibration.)

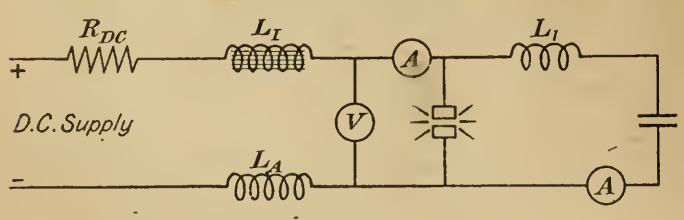

Fig. 6.

Circuit No. 1.

Capacity $C_1 = 3{\cdot}5$ millimicrofarad.
Inductance coil L_1, 600 microhenrys.
Cylindrical coil—20 cm. diameter.
40 turns.
12 turns per cm.
Diameter of wire, 0·45m/m.
Total resistance of circuit No. (1) for $\lambda = 2{\cdot}200$ metres, 7·5 O.
Current $I_1 = 1{\cdot}5$ A.
Power absorbed in circuit 1, 17 W.
Coupling between circuits (1) and (2).
$M = 12{\cdot}5$ microhenrys.
E.M.F. induced in the secondary by the primary $M\omega I_1 = 16$ V.

Circuit No. 2. (Fig. 7.)

Inductance Coil l about 5 microhenrys (one turn was variable and consisted of a spiral coil of 5 turns of bare copper strip 1 × 12 mm. outside diameter 20 cm.). This inductance was used to regulate the current i_2.

Inductance Coil L_2 about 0·4 microhenry. (One turn of bare copper strip 12 × 1 mm. wound round the middle of the coil L_1; diameter of turn, 20·5 cm.)

Inductance in the leads was reduced to a minimum by avoiding the formation of loops with the connections.

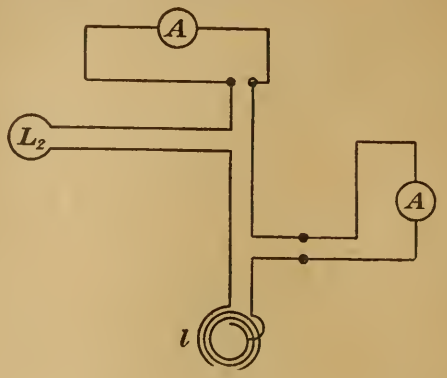

Fig. 7.

Current I_2.

First case, $l = 0$.
Total resistance of circuit No. 2 = 0·019 O.
Total inductance of circuit No. 2 = 0·58 microhenrys.
Total impedance of circuit No. 2 = 0·5 O.

Then $I_2 = \frac{16}{\cdot 497} = 32{\cdot}2$

Power absorbed by circuit No. 2 = 18 W. approx.
Total power furnished by arc = 35 W. high frequency.
Second case, $l = 5$ m. henrys.
Total impedance of circuit No. 2 = 4·28 O.

Then $I_2 = \frac{16}{4{\cdot}28} = 3{\cdot}75$ A.

The reaction of the secondary on the primary has a considerable effect on the wave-length, therefore when l is adjusted, the inductance of L_1 should be adjusted to keep the wave-length the same as before, this being checked by measurement on a wavemeter.

Three Useful Text Books.*

The first two books here noticed mark a breaking of new ground. Their object is to wed the elementary facts of chemistry and physics to their everyday applications in ordinary life, and to illustrate the facts of science by examples culled from the street and factory rather than from the laboratory. Thus in the book on "Chemistry" filtration and evaporation are illustrated by references to modern centrifugal filters, drying machines, and evaporators, while in the chapter on Combustion and Heat we are shown what Sheffield looks like on Sundays and on week days respectively, and thus draw the useful conclusion that the gas fire is a non-smoke producing heater which ought to be more widely used. Why electric heater should be left out it is best perhaps not to pause and consider. However, electricity comes into its own in the chapter on Combustion and Light, while in that on Oxygen and Nitrogen some details are given of nitrogen fixation processes.

In the book on "Heat" the same method is followed, and here a whole chapter is devoted to the electrical production of heat with illustrations of modern electric fires, electric kitchens, and other accessories, while electrical methods of measuring temperatures are given adequate space. The books are well and interestingly written, clearly printed, and adequately illustrated. They should fulfil the useful task of appealing to those who like their knowledge applied rather than pure. In the copy on "Heat," which we received pp. 149 to 156 were issued as a slip-in supplement, but we hope this is not usual.

The aim of the authors of the "Electrical Engineers' Pocket Book," which now reaches its second edition, is something more than a collection of tables and formulæ. Nevertheless there are a good many of both, and though the information which is given both in them and in the rest of the book is good and accurate, and the general get up, though the type is small, cannot be criticised, we really wonder at the increasing production of this type of work. The need for co-operation among the various branches of the electrical industry to avoid cut-throat competition is constantly being dinned into our ears. We suggest that a small association of those engaged in the publication of electrical books might be formed with the same end in view, as at present part of the ground is being trampled over by pressing crowds, while other parts upon which information is sadly required are being inexplicably left untilled.

*Heat, Part I., and Chemistry, Part I. By George Thompson and George H. Leslie. (London : Cassell & Company.) Pp. xii. + 160 and Pp. xi. + 159.

Electrical Engineers' Pocket Book. Second edition. (London : International Correspondence Schools.) Pp. xiii. + 487. 10s. 6d.

Electro-Farming.*

By R. BORLASE MATTHEWS.

Agriculture is the largest industry in this country. In England and Wales alone there are 418 000 farms and small-holdings, of which 36 000 have each an area of over 150 acres. There are 13 500 farms of over 300 acres each. Hence, there should be an enormous demand both for electrical apparatus and for current.

In this Paper it is proposed to give the results of an experimental investigation into the practical possibilities of the use of electricity in agriculture. The problem has been studied from a commercial standpoint, and the experimental work has been carried out on the lines of actual working farming. Nearly all the author's experiments have been carried out on his own farm of 600 acres at Greater Felcourt, East Grinstead, and at the same time Continental methods have been studied.

Various Facets of the Problem.

As in all other industries, the successful solution of the application of electricity is not merely a matter of belting a standard motor to existing machinery. The conditions and circumstances of farming are peculiar. The seasonal use of much of the machinery is limited and a large proportion of the labour available is prejudiced against, and unused to, machinery in any form. Special varieties of farming, *e.g.*, mixed, dairy, breeding, differ much in the requirements. The author considers that in future, for the most successful operation of farms, the use of electricity will be essential. If the efficiency of farming is to be improved, a change from present methods is imperative, and an increased efficiency, including the circumvention of adverse weather conditions, is easily obtained by electrical methods. Incidentally, the application of electricity to agriculture will do much to raise the status of the labourer.

The opportunities afforded for applying electricity on any farm naturally depend on its size. For farms of under 150 acres care is needed to ensure an adequate return for the capital expended, as the number of hours of use of each machine is limited. On larger farms, as the hours of use are longer, it is not so easy to make a mistake in this respect.

Electrical Applications on the Farm.

In the farm buildings electric lighting can be usefully employed in dairies, cow barns or byres, buildings, yards, &c., and for the intensive feeding of sheep, pigs, poultry, etc., during the winter. Electric driving may be applied to chaff-cutters and dust extractors, root pulpers and slicers, cattle cake breakers, corn crushers and grist mills, maizesheers, huskers and shredders, meat grinders and mincers, &c.

In the dairy there are many forms of machinery that can be electrically driven, including milk or cream separators, butter churns and workers, refrigerators, ice breakers, milk-churn transporters and elevators, milk-bottle cleaners, milk cooling and circulating pumps. Sterilisation of milk may be effected by an electrolytic bath and mercury vapour lamps. Incubators for testing bacterial contents of milk may be electrically heated.

In regard to poultry, electric light may be installed in the laying houses to increase egg production. There are electrical egg testers and electrically-heated incubators; opportunities exist for the use of electric fans and the electric driving of bone grinders, grain crushers, seed cleaners, sorters, and mixing machines.

General applications of electric power include pumping for domestic use, pumping liquid manure and sewage, and driving winches, hay hoists, elevators and transporters and milking machines. The workshop for repairs to farm machinery will contain much machinery that can be electrically driven.

Irrigation, Electro-Culture and Silage.

On the farm land there is irrigation by electric pumps, the distribution of artificial manure, ploughing by electric tractors, and cultivation and harrowing by similar implements, hay mowing, hay elevating, corn cutting and binding, and many other processes that may be effected by the electric drive.

The treatment of growing crops includes electro-culture by high tension, high frequency electric discharge, ozone treatment or mercury lamp treatment for stimulating growth, destroying insect pests, or strengthening plants and enabling them better to withstand changes in weather. Milk vans and lorries may also be electrically driven.

There are many processes in connexion with gathered crops which are assisted by electrical apparatus, such as the electrolytic conservation of greenstuffs, hay-drying and grain-drying by electric fans; desiccation of vegetables and fruit for supply to jam-makers, There are many machines, such as automatic silage stackers, threshing machines, grain graders, winnowers, and balers, potato-sorters, hop-dryers, flailing and malting machinery, clover, pea and bean hullers, which can be driven electrically. While finally, electricity can be used for lighting, heating and domestic uses in the farmhouse.

*Abstract of a Paper read before The Institution of Electrical Engineers.

Some Radical Changes Necessary.

Most of these applications of electricity are closely allied to procedure in other industries. Most problems associated with electrical drives inside the farm buildings are now solved—but in some cases radical changes will have to take place in the design of the actual machines. The biggest demand will always be for machinery which is practically self-contained and fool-proof. However, for the next few years the portable motor will serve most requirements.

On the land slower progress has been made in applying electrical methods, and certain changes will have to be made in British methods of agriculture, such as the gradual adoption of more intensive cultivation, the institution of soiling crops, inter-cropping, and the greater employment of artificial manures. These changes will favour the use of electricity on arable land, since the work will be more regular, and idle fallows will be eliminated.

Only a few days' work each year is required in any one field and even this short time is occupied with such diverse operations as ploughing, cultivating, harrowing, rolling, hoeing, reaping and gathering. Electrical methods of performing these operations have now passed the experimental stage. But few engineers have sufficient knowledge of the intimate details of farming methods to develop electrical methods. The problem might be simplified if the farmer were regarded as a manufacturer who, commencing with certain raw materials, puts them into a more refined condition—with possibly a second process if he converts his refined materials into the form of animal flesh. All by-products are—or should be—fully utilized. Present farming is based upon an abundance of cheap labour and a disregard for time. However, there are difficulties in modernizing a business in which the load factor of each machine is so low, though a completely electrically-equipped farm may have quite a satisfactory load factor.

Current Consumption.

The annual consumption of electricity in farm buildings alone averages 10 kWh per acre.

Figures may work out as follows:—

Area of farm.	Usual farm buildings, max. demand	Farm bldgs., kWh per annum.	Farm hand, kWh per annum.
Acres.	H.P.		
1	—	10	44
150	3	1 500	6 600
300	5	3 000	13 200
600	15	6 000	26 400

The Supply of Electricity to Farms.

As the outcome of experience, practice in electric power distribution for agricultural purposes is settling down to a simple standard. While the main distribution may be at any pressure over 50 000 V in Europe, a sub-distribution of 10 000 V, three-phase, 50 periods, is becoming usual.

For economic and other practical reasons the number and size of transformers are reduced to a minimum. For farm work 50 kVA is a useful minimum size. From this transformer, supply distribution lines can be conveniently run in any direction for a distance not exceeding 2 500 yds. Every farm within reach of this local distribution is connected, and a good load factor is obtained. In Denmark, overhead lines of 0·39 sq. in. are usually employed for farm supply. To allow for pressure-drop, motors installed at the ends of the lines are wound for a voltage 10 to 15 per cent. below normal.

Unquestionably the best and cheapest method by which the farmer can obtain power is from a public distribution network, but where this does not exist he must install a properly designed independent plant.

The author has devised an arrangement whereby the farmer's oil tractor can be made to give effective service until a permanent plant is available. The scheme comprises a special reinforced concrete runway, having strong side guiding kerbs. These kerbs always align the tractor in the same position facing the dynamo, which is mounted on a suitable pedestal and driven by an endless belt from the tractor pulley. The dynamo is attached by cam-clamping bolts to belt-tightener rails. The latter are provided with

an adjusting screw operated by a crank handle. Thus the belt can be very quickly adjusted as the tractor is taken away or brought in.

Power Rates.

It is to be hoped that central power supply undertakings will not stipulate for rates based on the horse-power of the motors connected. Such rates discourage a farmer from installing a number of motors. With the aid of suitable technical advice it can be demonstrated to farmers that they can obtain better terms on a self-restricted maximum demand. Agricultural-implement manufacturers are already catering for this requirement by providing such machines as threshers in such a form that the work is carried out in two separate stages. In one machine the corn is threshed and cleaned sufficiently for the farmer's own needs. In the second machine that portion of the corn from the thresher that is intended for the market is finally dressed, cleaned and sorted. Either of these machines can be driven by a 5 H.P. electric motor, as compared with the 12½ H.P. motor required for a standard full-size thresher.

Electrically operated farm machinery should be of a design and construction as rarely to need overhaul. A trouble often encountered with farm electric motors is damage by moisture, due either to rain or to condensation. Motors should be as waterproof as is feasible. Ball-bearing electric motors are to be preferred, if provided with good felt packings, as frequent lubrication is eliminated. Undoubtedly the most practical motor for farm use is the three-phase squirrel-cage type. For farms of over 300 acres the author favours three-phase power installations on this account.

Motor Problems.

On a farm where other than manual power is employed in the barns the machines most commonly in use are hay chaffers, root cutters and pulpers, grinding mills, cattle-cake breakers, and firewood saw benches. These are chiefly used during the winter time, and even then for only a few hours daily. At first thought, the load factor does not appear attractive. However, if electricity is available it will soon be employed for a variety of other purposes. An important use, where water is not already laid on, is for driving the water pump for general farm purposes and also for domestic use. Another essential service is the driving of a liquid-manure pump. If a dairy herd of more than ten cows is kept, it is advisable to employ a motor-driven cream separator and also a milking machine. For the driving of the milking machine 2 to 3 H.P. is required. Over 9 000 farms in New Zealand employ milking machines. The milking load comes on very early in the morning and again in the afternoon. The preparation of food for the live stock is usually carried out in the morning. If a threshing machine, and also a hay and straw transporter and elevator are added to the above equipment, there will be a fairly heavy load for twelve hours each day during the winter. In addition, electric lighting will be needed in the early morning hours and again at night. At the hay and corn-harvest periods, the driving of the barn machinery would be replaced by the operation of an electric fan for curing the hay and sheaves of corn, also for elevating hay and silage crops ; in addition a chaffing machine would have to be driven for cutting silage. If a number of sheep were kept, an electric shearing machine should be employed. Among the uses on the land that should be seriously considered nowadays are electric ploughing and cultivation, electro-culture of growing crops, and electric treatment of silage. After all, the requirements of each farm have to be specially studied, as the form of farming so often differs, as does also the arrangement of the buildings.

Sizes of Motors Required.

On a small farm of under 150 acres the barn machinery required can usually be driven by a 1 H.P. motor. However, for the chaffing machine it is preferable to employ 3 H.P. motors, as this size will do the work more quickly and provide an ample margin for the counter-shaft losses. On a farm of 150 to 300 acres a 5 H.P. electric motor is most suitable, as the barn machinery on these farms is slightly larger. On farms of over 300 acres at least 15 H.P. motors are required, as still heavier machinery has to be driven, inclusive of a full-size threshing set. The latter in itself requires, about 12½ H.P., and in addition a small margin is required for driving a small trusser and possibly a feeder in conjunction with the thresher. Where the electric drive is available on the larger farms, it will also be found advisable to incorporate with the chaffer a cyclone dust-extractor.

An air-pressure system for the supply of the water will be found to be the most efficacious. With a well 1 to 25 ft. deep, a pump of ½ H.P. will deliver 360 gallons per hour. With wells 50 to 600 ft. deep, ¾ to 3 H.P., delivering 200 to 1 500 gallons per hour, is usual.

Portable Motors.

With a view to eliminating counter-shaft drives and enabling each piece of barn machinery to be placed in the most convenient position, portable electric motors are now favoured. However, it is a moot point as to whether, in the course of the year's use, the value of the time lost in adjusting and fixing them would not pay the interest and depreciation on a direct-connected motor. Difficulty is often experienced with the installation of a suitable counter-shaft drive, owing to the fact that it has often to be placed in somewhat antiquated buildings. On some of the more up-to-date farms, counter-shafts fitted with ball-bearings are employed, and arranged for self-alignment. It is difficult to get farm labourers to keep the belts in order, especially as the machines are not in constant daily use. Where counter-shaft drives are employed on farms, it would be a good plan to mount the driven machines on slide-rails, like those used for an electric motor, as this would save much belt trouble.

Portable motors have one great point in their favour, *i.e.*, they enable new drives to be tried and experimented with in cases of doubt. For work outside the farm buildings they are often invaluable.

Portable motors for use on farms should preferably be provided with starting switches and fuses or circuit breakers mounted on the side of the motor frame. The flexible leads from the source of supply should form a cable in which an extra earthing wire is included. A convenient standard length of cable is 40 ft. If a longer length is necessary a light wooden reel should be supplied upon which to coil any excess length not in use. A double-width pulley on the motor spindle enables the alignment of the portable motor to be quickly made. The motors should preferably be of drip-proof type.

Small motors complete with starters and flexible cable can be obtained ready mounted on handle bars, enabling them to be carried from place to place by a couple of men ; alternatively the motors are mounted on timber skid frames or on wheeled frames, on which they can be drawn into convenient positions, being ready for service in their new location as soon as the belt is attached. Continental practice favours very substantial 3-point suspension horse-drawn enclosed vans, for motors of 15 to 40 H.P. For smaller motors, the author advocates a wooden platform, suitable for use with transporter or lifting trucks, as employed under modern factory conditions.

All-Electric Automatic Power Signalling on the Metropolitan Railway.*

By W. WILLOX.

In 1905 when electric trains commenced to run on the Metropolitan Railway, the system of signalling was mechanically controlled by Spagnoletti lock and block. The number of trains between Praed-street Junction and Aldgate—about 5 miles—was then 621 per day on both roads, and the number of signal sections was forty-nine. When the number of trains was increased, it was found necessary to introduce automatic signalling controlled by track circuits. The system chosen was all-electric, and the work was begun in 1908. This section was completed in 1909. Two power frames were installed, one at Praed-street Junction and one at Aldgate, to deal with the traffic at these places, but the existing mechanical boxes at the intervening stations were retained for shunting purposes, with the addition of the safeguards afforded by track control. The number of trains in 1913 at Praed-street Junction was 863, and from Baker-street to Aldgate 983, and the number of signal sections ninety-one.

Present Traffic Conditions.

There are about twenty hours daily of continuous passenger traffic, but from 7.30 to 10 a.m., and from 4.30 to 7.30 p.m., the traffic is so dense as to necessitate forty booked trains to and forty from the City per hour, and the automatic signalling deals with these successfully. Similar signalling was therefore installed between Baker-street and Neasden in 1911, the number of signalling sections being increased from twenty-four to fifty-one. At this date there was only one through line at Baker-street dealt with by two signal boxes, one at the north end of the station and one at the Circle end. This through line was track circuited, and full protection was afforded to train movements, allowing forty-eight through passenger trains to be run to and from the City. All the current used in these installations was direct.

First Automatic Installation.

In 1913 the new Baker-street Station was completed, and automatic signalling was installed between the Circle lines and the north end of the station. For this purpose a small signal box was constructed on a retaining wall so as to be out of the way, and in it a power frame of thirty-six levers (six spare) was installed. This power frame deals with over 1 500 trains a day, and it is interesting to note that the signalman has no view of the trains except those within station limits immediately in front of his box. Through the station all signals and points are controlled by d.c., but the track circuits are a.c. In 1913 two new fast lines were constructed alongside the old or local lines from Finchley-road

*Abstract of a Paper read before the Institution of Civil Engineers.

to Wembley Park, a distance of 5 miles. Through the junction at Finchley-road and on to Wembley Park a.c. track circuits were installed, but the signals are worked by d.c. as far as Neasden Power House. From this point to Harrow-on-the-Hill a.c. is used for the signals as well as for the tracks, and from the same point a.c. is used both for tracks and signals on the local lines to the junction north of Wembley Park Station where the fast and local lines converge. From Baker-street to Harrow-on-the-Hill before automatic signalling there were thirty-nine signalling sections, now there are sixty-nine, and on the through fast lines there are twenty sections. In 1919 the signalling from Praed-street Station to South Kensington, which was an automatic bar and treadle system controlled by d.c., was track circuited with a.c., but the signals continue to be controlled by d.c.

Power Supply Arrangements.

Current for the supply of power to operate the power frame at Praed-street Junction and at Baker-street is obtained from two 130 V 5 kW motor-generators through suitable cables. These supply power for the operation of the points, the signal lamps and train stops, the electro-magnets for back-locks and for the constant indication of power-worked points at Praed-street Junction, and also for working the power frame at Baker-street, the total required for both boxes being 2·08 kW.

For operating the track circuits, automatic and semi-automatic signals, and train stops, between Praed-street, Bishop's-road, and Edgware-road stations, and also between Edgware-road, Great Portland-street and Marlborough-road, and for the four large illuminated train indicators at Baker-street, power is obtained from one 15 kW and two 12 kW 70 V motor-generators in Baker-street sub-station, the maximum power taken being 14 kW. The mechanical locking in the power frames is ordinary miniature tappet locking controlled by levers in the ordinary way, the electric locking frame being behind the levers. Illuminated continuous diagrams are placed behind the frames lighted by 75 V 5-candle-power lamps.

Interlocking Devices.

All signals at junctions are electrically back-locked, an important safety device which in the further development of electric signalling has enabled point locking bars to be dispensed with. At all running stop-signals there are train stops which are not connected to the signals mechanically, but electrically, and are controlled by the track circuits in the same manner as the signals, coming to clear and going to danger with the signal. They are also controlled by the track circuit independently of the signal, so that, if a signal failed to go to danger, the arm of the train stop would still go to the danger position.

All electric signals are either automatic or semi-automatic, the former being controlled through the track circuits by the passage of the trains, and the latter from signal box when this is in use, but becoming automatic when not so controlled. Inside the tunnels the signals are lamp signals, outside they are upper quadrant semaphores worked by electric motors. Signals are held normally in the clear position by electric power; they go to danger by gravity. All signals are lighted electrically, and stationmasters light the signals halfway to the next station on either side by a switch at their station. One hundred yards behind each stop signal in the open fog repeater signals have been erected, the lights of which are placed at the level of the driver's eyes and as near as possible to the running line. By this means an indication is given to the driver whether the stop signal ahead is at clear or at danger, and if at danger he can slow up and avoid being tripped suddenly. The signalmen have fog repeater switches in the signal box by means of which they can light the fog repeater lamps when necessary.

Train Describers.

Between junctions it is possible to have a number of trains—*e.g.*, between Finchley-road and Baker-street it is possible to have ten trains—and Mackenzie Holland and Westinghouse Company's magazine train describers are installed, by which the signalman at Finchley-road is enabled to indicate to the Baker-street signalman whether the train terminates there or is a through train to the City. All points where there are power frames are worked by the Mackenzie Holland and Westinghouse all-electric point machines. These machines are enclosed in a water-tight cast-iron case divided into three compartments. At one end is the motor, in the centre are the gear wheels and motor switches, and in the other end the worm drum that operates the points and the bolt that locks them both ways. Both point blades, as well as the bolt lock, are individually detected through an electric detector fixed in the four-foot way before the signalman can get his signal for a train to pass over that route. These point machines are most successful.

Track Relays.

The track relays at Baker-street are of the single element vane type, the shunt by a train averaging 0·9 O. The relays used on the d.c. system are of the 3-coil polarised type, the shunt of which by a train averages 0·15 O. Where a.c. is used the track relays are of the two element galvanometer type and the shunt of these by a train averages 0·6 O. The most recent type of relay used is a two element vane relay, the shunt of which by a train averages 3·4 O. The cost of maintenance of this system of signalling is not excessive. Before automatic signalling was installed there were 645 levers in use, whereas at present only 311 levers are in use, while the number of signalmen were reduced from 86 to 27. This meant in 1908 a saving of £127 per week in signalmen's wages, which at the present date would amount approximately to £325 per week. During 1920 the whole cost of maintenance—wages and materials—of the signalling of the electrified lines amounted to £123 per route mile.

Charts have been kept from the commencement of automatic signalling in order to ascertain the number of delays to trains as compared with delays to trains with ordinary signalling, and the comparison comes out very favourably to automatic signalling.

Tests have also been made with a 3-position light signal as used on the Pennsylvania Railway in the United States of America. The cost of maintenance is about the same as with 2-position semaphores, but the light signal would appear to have advantages in some respects, *e.g.*, the entire absence of mechanical parts, and in the power of penetration of the light rays both in sunshine and in fog.

Review.

Practical Electricity. By W. E. Ayrton, F.R.S., and T. Mather, F.R.S. (London: Cassell & Company, Ltd.) Fourth Edition. Pp. xv. + 547. 15s. net.

This is an old friend—a friend to be treated with affection and respect, and one whose very failings have the savour of virtues. It was first published in 1887, and this is its twenty-third reprint and its fourth revision. On this occasion Professor Mather has taken the opportunity of bringing the symbols used into line with the recommendations of the International Commission—a valuable revision step. He has also rewritten the section on dry cells, and, according to the preface, has amplified that dealing with storage cells.

It is generally known, we presume, that the book is intended to be a laboratory and lecture course, and that the title "Practical Electricity" was designed to indicate that the subject matter dealt with the applied side of the science, and was not to be interpreted in the same sense as such titles as "Practical Physics" and "Practical Chemistry." The book under review covers a much wider area than a laboratory course, though in the main it does converge upon work in the laboratory and particularly upon work in the laboratory of the Central Technical College at South Kensington.

The course is intended for "first year" students—that is to say, for the type of students in the first year of the course at the Central Technical College, and not for absolute beginners. It also follows that it is intended for students who are full time students and who have time to cover the wide course which this book covers in a single year. This is not to suggest that other students cannot use the book profitably—they can, but they must take a longer time.

There are eleven chapters dealing in turn with current measurement, magnetic fields, galvanometers, electrodynamometers, and ammeters, difference of potential and resistance, galvanic cells, the laws and measurement of resistance, energy and power, quantity and capacity, induced currents, and the magnetisation of iron. The whole is a very excellent foundation course, although our view, given with all the deference due to a work which is classic, is that some of it could be cut with advantage. We can quite understand that Professor Mather had the feeling of a vandal when he armed himself with a blue pencil, though he might agree, in private, that more ruthless treatment with that weapon would not have weakened the tree of knowledge which the book represents. One of the very strong features of the book is the careful explanation of the principles and action of the various measuring instruments used in electrical work. We feel that this is too often neglected, and there is no doubt that students can take a much more intelligent view of the tests which they perform if they are thoroughly conversant with the instruments they use. At the same time we feel that much of the work on the tangent galvanometer might have been cut advantageously. We think, too that there is more about primary cells than is necessary, and we wish that Professor Mather had extended the section on storage cells very much more than he has done.

But, from the point of view of the educationist, our opinion of the book as a whole may be gauged from this: That it must be very pleasant and very comfortable to take a class of "second year" students all of whom have read, performed, marked and inwardly digested the contents of this first year course of "Practical Electricity."

J. Paley Yorke.

The Thermionic Triode as Rectifier.*

By E. B. MOULLIN, M.A., and L. B. TURNER, M.A.

The performances of the triode rectifier arrangements used in wireless telegraphy, with signals of various strengths and with or without a superposed local heterodyne oscillation, are investigated theoretically and experimentally. The results are illustrated numerically by reference to a certain well-known pattern of triode, and in the more fundamental cases the theoretical deductions are compared with precise experimental measurements made at low frequency. The agreement is found to be very close.

In the present Paper, the performances of the various triode rectifying arrangements have been calculated fairly exhaustively in terms of the parameters of the triode as exhibited in its static characteristic curves. The theoretical results obtained are in all cases illustrated by numerical calculations for a single typical pattern of triode, the well-known "R" triode, and they have been experimentally checked in the more fundamental cases by precise measurements with signal E.M.F.'s of low frequency (50 periods per sec.).

The rectifier arrangements investigated with these signals are classified as follows:

(R1).—Rectification by curvature of anode characteristic, called "anode rectification";

(R2).—Rectification by curvature of grid characteristic, called "grid rectification";

(R3).—The same with grid condenser, called "cumulative grid rectification."

Theory of Rectification of Sustained C.W.

The theory is well known, but may be stated briefly as follows (Fig. 1): Let the asymmetric conductor (the rectifier) have a curved

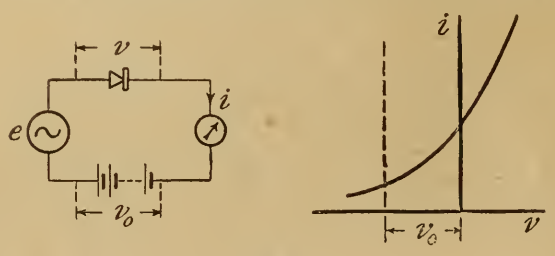

Fig. 1.

characteristic of the general form $i = f(v)$, and suppose, moreover, that it is possible to represent this function by an infinite series. Then $v = v_0 + e$,

$$\text{and } i = f(v_0) + ef'(v_0) + \frac{e^2}{2!}f''(v_0) + \frac{e^3}{3!}f'''(v_0) + \ldots$$

Let $e = a \sin pt + a_3 \sin 3pt + a_5 \sin 5pt + \ldots$

$$\text{then } i = f(v_0) + (a \sin pt + a_3 \sin 3pt + a_5 \sin 5pt + \ldots)f'(v_0) + \frac{1}{2!}(a \sin pt + a_3 \sin 3pt + a_5 \sin 5pt + \ldots)^2 f''(v_0) + \ldots$$

If the change of mean current due to the signal e is I_r,

$$I_r = \frac{(a^2 + a_3^2 + a_5^2 + \ldots)}{4} f''(v_0) + \frac{(a^4 + a_3^4 + a_5^4 + \ldots + 2a^2a_3^2 + \ldots)}{64} f''''(v_0)$$

Now suppose that the values of a, a_3, a_5, &c., and $f''''(v_0)$, &c., are such that

$$\frac{(a^4 + a_3^4 + a_5^4 + \ldots + 2a^2a_3^2 + \ldots)}{16} f''''(v_0)$$

is small compared with $(a^2 + a_3^2 + a_5^2 + \ldots)f''(v_0)$; then

$$I_r = \frac{\text{mean-square } e}{2} f''(v_0) \equiv \frac{\mathcal{E}^2}{2}\frac{d^2i}{dv_2} \quad \ldots\ldots\ldots\ldots(1)$$

Hence unless the characteristic curve is such that d^4i/dv^4 is very large, the rectified current from a very weak signal is proportional to the rate of change of the slope of the characteristic, and to the square of the strength of the signal P.D., whether the latter contains harmonics or not—a point not always noticed.

In the original Paper are shown curves relating to observed rectified current with the square of the virtual value of the signal E.M.F. They are all straight lines so long as the applied E.M.F. does not exceed 1·3 V (R.M.S.).

The rectified current from a 1 V signal is almost independent of mean grid potential over a wide range, and the rectified current is nearly $16\mathcal{E}^2$. The anode current characteristic of an "R" valve is very nearly a parabola and is therefore given by the equation:

$$i_a = \alpha + \beta v_g + \gamma v_g^2$$

If the signal much exceeds about 0·5 V (R.M.S) the terms involving $\mathcal{E}^4 . d^4i_a/dv_g^4$, &c., assume importance; but that if the signal is less than 0·5 V the rectified current varies very closely as the square of the signal strength. If, therefore, a constant weak signal is applied

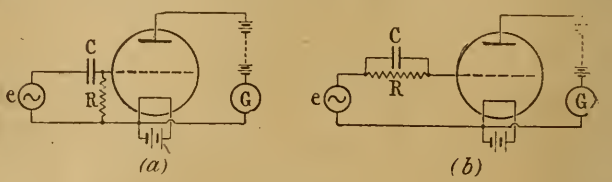

Fig. 2.

and the rectified current is measured with various mean grid potentials, it should be possible to deduce the value of d^2i_a/dv_g^2 for any mean grid potential.

Cumulative Grid Rectification.

In the method which goes under the name of cumulative grid rectification the grid is partially insulated by the insertion of a "leaky" condenser, as in Fig. 2. The signal current is now the change of mean anode current accompanying change of mean grid potential due to rectification in the grid circuit. The method is well known, but its quantitative theory has not been clearly set out. It is best approached graphically, as the significance of the necessary approximations made is then more clearly appreciated. The two methods of connection shown in the figure are electrically equivalent, and in each case the steady non-signal grid potential is found from the simultaneous solution of the equations.

$$i_g = f(v_g) \text{ and } i_g = -v_g/R$$

The shape of the grid current curve $f(v_g)$ is such that its analytical treatment is impracticable, and the solution can best be found graphically as shown in Fig. 3. The steady grid potential is given by OA, the abscissa of the point of intersection B of the grid and resistance characteristics.

Function of the Condenser.

The function of the condenser in the two methods of connection is slightly different. In Fig. 2 (*a*) its function is to interrupt the circuit RCe so far as steady currents are concerned; and C is supposed to be so large that the alternating current flowing through it produces no sensible alternating P.D. across it. In other words the full-signal E.M.F. may be considered to be applied between grid and filament. In Fig. 2 (*b*) the function of C is to provide a high-frequency shunt across R, so that again the full signal E.M.F. may be considered to be applied between grid and filament. The alternating potential of the grid makes the mean grid current increase; and since, in either method of connection, this increased current must flow through R, the mean grid potential is thereby lowered. The accompanying reduction of mean anode current is utilised to operate an indicating instrument.

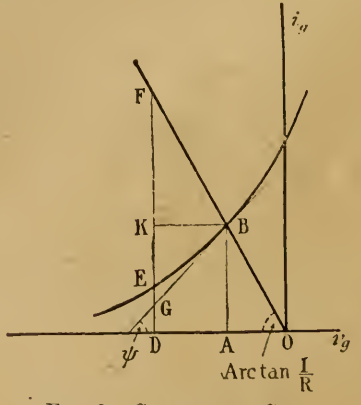

Fig. 3.—Cumulative Grid Rectification.

Theory of the Method.

Suppose that the E.M.F. applied to the grid produces a rectified current I_r. Find a point F on the line OB such that the intercept FE of the ordinate FD between the resistance line and the grid curve is equal to I_r on the scale of the diagram. The new mean grid current is DF, which may be analysed into two parts, FE

* Abstract of a Paper read before the Wireless Section of the Institution of Electrical Engineers.

called the rectified current, and FD the steady grid current associated with the new mean grid potential OD. The fall of mean grid potential is evidently DA, and hence the fall of mean anode current is $DA \times \frac{di_a}{dv_g} \equiv g \,.\, DA$.

The method checks closely with careful experimental verification. The fact also arises that it matters little whether the leak is connected to the positive or negative end of the filament, provided only that R is large, say at least 5 megohms.

The function of the condenser is that of a high-frequency shunt. In order to keep the time-constant of the circuit as low as possible, the capacity should be kept as small as is compatible with its efficient action as a shunt.

The condenser may safely be reduced to (say $50\mu\mu F.$; and as the equivalent resistance of grid and leak in parallel is about 1·5 megohms, the time-constant of the circuit can be reduced to about 75 micro-seconds. With these values, if signals of 3 000 metres wave length are being received, the signal current will attain its calculated value in about 40 periods.

In the circuit of Fig. 2 (*b*) it is possible to omit the condenser altogether. In this case calculation gives :

$$S = 55\mathcal{E}^2 \text{ if } \frac{di_a}{dv_g} = 300 \text{ micro amperes per volt.}$$

TABLE I.

Strength of signal $\mathcal{E}$ volts (R.M.S.).	Signal current in micro-amperes, with		Ratio.
	Anode rectification.	Cum. grid rectification.	
$<0{\cdot}1$	$16\mathcal{E}^2$	$500\mathcal{E}^2$	30
0·25 to 2	$16\mathcal{E}^2$	$150\mathcal{E}$	5 when $\mathcal{E}=2$
>10	$100\mathcal{E}-800$	1 000	1 when $\mathcal{E}=20$

These values may not appear to agree to the results obtained with practical wireless receivers, and this is due to the effect of a number of factors which are distinct from those now treated.

Anode Rectification with Heterodyne of Moderate Strength.

With the signal potential difference $e = a \sin pt$ and the superposed heterodyne potential difference $b \sin qt$, the amplitude of P.D. across the rectifier varies between $(b + a)$ and $(b - a)$ at an acoustic frequency small compared with the wireless frequency $p/2\pi$. Hence the high frequency mean of the anode current ranges from

$$\tfrac{1}{4}(b+a)^2 \,.\, d^2i_a/dv_g^2 \text{ to } \tfrac{1}{4}(b-a)^2 \,.\, d^2i_a/dv_g^2$$

The signal current is therefore

$$\frac{1}{4}\frac{d^2i_a}{dv_g^2}\left\{(b+a)^2-(b-a)^2\right\} = ab\frac{d^2i_a}{dv_g^2} \text{ as before.}$$

But the formulæ

$$\text{mean } i_a = \tfrac{1}{4}(b \pm a)^2 \,.\, d^2i_a/dv_g^2$$

are applicable only for values of $\mathcal{E} = (b + a)/\sqrt{2}$ up to about 2 V, and over this range for an "R" triode d^2i_a/dv_g^2 = constant $\doteqdot$ 32 micro-amperes per volt per volt. Hence the best signal current with a weak signal (namely, when $b + a \doteqdot b$ is adjusted to be about $2\sqrt{2}$ V) is

$$S = 128\mathcal{E} \text{ micro-amps.}$$

Anode Rectification with Very Strong Heterodyne.

The signal current tends towards the value $0{\cdot}45g \times \sqrt{2}a = 0{\cdot}90g\mathcal{E}$ as the heterodyne strength is increased, provided that the filament emission is adequate to prevent Q from reaching the convex upper end of the curve.

In most "R" triodes g is about 300 micro-amperes per volt; so that with a very strong heterodyne we have a signal current

$$S = 0{\cdot}90 \times 300\mathcal{E} \text{ micro-amps.}$$
$$= 270\mathcal{E} \text{ micro-amps.}$$

This value is to be compared with the value $128\mathcal{E}$ found in the last section for a heterodyne amplitude of 2 V. It is thus clearly worth while to use a heterodyne of adequate strength. A heterodyne strength of some 15 V would be suitable, and would give a sensitivity slightly exceeding the above $270\mathcal{E}$ micro-amps.

Cumulative Grid Rectification with Heterodyne.

Owing both to uncertainty as to the equation of the i_g/v_g characteristic and to difficulties of the integration involved in the cumulative action, it is not possible to write down an expression for the instantaneous anode current, as has been done in the case of anode rectification.

Admitting a number of assumptions,

$$S = Kab = \sqrt{2}Kb\mathcal{E}.$$

The value of K already found for a small potential difference on the grid is, for an "R" triode, 1 000; and if we take $b = 0{\cdot}14$ V, which is the highest value for which the formula is applicable, we get

$$S = \sqrt{2} \times 1\,000 \times 0{\cdot}14\mathcal{E} \text{ micro-amps.}$$
$$= 200\mathcal{E} \text{ micro-amps.}$$

If on the other hand b lies between 1 V and 5 V, the mean anode current (from Fig. 19) fluctuates between $150(b + a)/\sqrt{2}$ and $150(b - a)/\sqrt{2}$. Hence

$$S = 150\sqrt{(2)}a \text{ micro-amps.}$$
$$= 300\mathcal{E} \text{ micro amps.}$$

Comparison Between Anode and Cumulative Grid Rectification.

TABLE II.

Strength of heterodyne (volts, R.M.S.).	Signal current in micro-amperes, with		Ratio.
	Anode rectification.	Cum. grid rectification.	
0·1	$6\mathcal{E}$	$200\mathcal{E}$	30
2	$128\mathcal{E}$	$300\mathcal{E}$	2½
>15	$270\mathcal{E}$	Very small.	Very small.

Taking an example of rectification by curvature of the anode characteristic in comparison with damped waves of a frequency "n" of 10^5 periods per sec., decrement "δ" 0·1, and 500 sparks per sec. "x," the signal strength is only one-fortieth of what it would have been had the wave been undamped and of maximum value equal to the first maximum of the damped train.

The ratio of signal current when working with heterodyne to signal current when receiving a damped train of the frequency and decrement already stated is $(200a) \div a^2/5 = 1\,000/a$. If, for example, a has the value 0·1 V, this ratio is 10 000[1].

Probably a fairer comparison is between undamped waves and spark trains having the same R.M.S. value, rather than the same initial amplitude. The R.M.S. value over one spark period of the damped train $e = a\epsilon^{-mt} \sin pt$ is

$$\mathcal{E} = \tfrac{1}{2}a\sqrt{(x/n\delta)}$$
$$= \tfrac{1}{2}a\sqrt{(1/20)} \text{ in the numerical instance}$$
$$= 0{\cdot}11a$$

The signal current with a heterodyned undamped signal of this strength is therefore

$$S = 270\mathcal{E}$$
$$= 270 \times 0{\cdot}11a = 30a$$

The ratio $1\,000/a$ found for equal initial amplitudes thus becomes, for equal R.M.S. values,

$$30a/(a^2/5) = 150\,a$$

With $a = 0{\cdot}1$ V as before, this ratio becomes 1 500.

In the largeness of this figure, it is suggested, lies the chief explanation of the much superior ranges of continuous-wave transmitters as compared with spark transmitters of equal radiated power.

DISCUSSION.

In opening the discussion Dr. W. H. ECCLES thanked the authors for entering and enforcing order in a chaotic subject. He proceeded to show that for a theory based upon the static characteristics with constant anode potential there was a simpler method than that used by the authors, which avoided the use of Taylor's theorem. He pointed out the dangers of arguing from low frequency to high frequency. The apparatus in the anode circuit had a great effect at high frequencies. The authors had, by the use of a low frequency, grasped an ideal set of conditions but they had not proved that their theory fitted the high frequency case. He expressed his pleasure at the precision of meaning and good English used in the Paper and wished that patent specifications more frequently exhibited these qualities. The Paper, both in matter and in style, was worthy of the University of Cambridge.

Reaction or Slope.

Prof. C. L. FORTESCUE said that at first sight the Paper confirmed already accepted views, but the figures given showed much greater differences between different methods than were found in practice to be the case. This might have been due to the authors' reliance upon the static characteristic. Probably the reaction between

portions of the circuits which almost inevitably took place in ordinary receiving sets had more effect than the slope of the characteristic curves. Reaction in a receiver would draw out a damped wave train and so reduce the difference between them and C.W. There was controversy over the relative efficiencies of cumulative grid-leak *versus* anode rectification. Grid rectification did not respond to as large variation as anode rectification. The authors did not seem to have considered rectification at the top of anode characteristic curve. By combining cumulative grid rectification with rectification at the top of the curve there was a distinct gain in sensitivity.

Mr. J. Hollingworth queried the effect of the time constant of the grid circuit for cumulative grid rectification and Mr. F. J. Chambers gave particulars of experiments he had carried out to show how the anode potential actually behaves.

Mr. L. B. Turner claimed very little credit for his share in the Paper. He had only made suggestions for work to be carried out.

Rectification.

The Chairman (Prof. G. W. O. Howe) appreciated the Paper and its discussion. It was a good thing to have a variety of Papers and the present one came between two which contained no mathematics. Referring to the author's remarks on assymetric conductors he questioned the use of the word rectification and whether they were getting real physical rectification. Prof. Fleming's patent specification claimed rectifying properties due to the electrodes being in different states. The current could pass in one direction, but not in the other. Nevertheless, it was a fact that in use the Fleming valve had an anode battery and did not operate under conditions in which there was any attempt to pass current in a reverse direction. He (Prof. Howe) had used two hot filaments as electrodes, and thus made the device symmetrical. By the use of an anode battery he had obtained rectification by curvature of the characteristic curve. If he were to criticise a very excellent Paper it would be on the grounds of its absolute disregard of any previous work. Van der Bijl had shown the characteristic curve to be a parabola and had done much of the work covered by the Paper. Barkhausen also had done useful work. The Paper should have indicated what was old and what was new.

Mr. E. B. Moullin, in reply, engaged Dr. Eccles in argument over processes of mathematical expansion, and questioned whether the ordinary sets mentioned by Prof. Fortescue used voltages so negative as those of which the Paper treated. It was important to note that the Paper aimed at elucidating the problems only of plain rectification. He objected to Mr. Turner's modest disclaimer of credit for the Paper. His help had been very valuable.

The Institution of Electrical Engineers.

At the meeting of the Institution of Electrical Engineers on March 30, Mr. R. Borlase Matthews read a Paper on "Electro-Farming," which was illustrated by cinematograph films. Attracted either by the interest of the subject or the call of the pictures, the attendance was rather larger than usual. Considering the stuffiness of atmosphere that sometimes occurs in the lecture theatre, a praiseworthy attempt at ventilation was made by keeping all the doors open until the proceedings started. The attempt was certainly successful, as it was an hour later before we began to feel comfortably warm.

On the conclusion of the Paper and cinematograph demonstration, which together took about an hour, the President announced that the discussion would be adjourned until the following Thursday so that the speakers might have full scope. The lantern operator, who is usually so deft and speedy, on this occasion started Mr. Matthews' slides at the wrong end, and was only after some difficulty and long-distance elocution persuaded to alter his procedure.

All-Electric Milk.

Passing from theory through illustrative practice to actual practice, Mr. Matthews exhibited a bottle of milk which he said was the first supplied in this country by all electrical methods. The cows which produced it had been fed by electrically-cut roots, had been milked by electrical machinery, the bottle had been cleaned by an electrically-driven brush, and the cap had been fixed by heating a small quantity of casein electrically to form an efficient seal.

Unrelieved Pessimism.

Mr. Llewellyn B. Atkinson, in opening the discussion, said that in considering the desirability of adopting electricity as a motive power on farms, the small output in pounds sterling which could be obtained from a certain area of land and the small amount of time that any machinery would be required to work in a year must be remembered. For the seven years' cycle ending 1914 the average income per acre per annum from farms in this country was £5 15s. A large majority of the farms were less than 150 acres in extent, so that the revenue would be between £750 and £1 000 per annum. All the threshing on an ordinary farm in a year could be done in about thirty hours. The author placed the consumption of a farm of this kind at about 1 500 kWh per annum, with a maximum demand of 3 kW. That meant about one and a half hours' use of the maximum demand per day, and a total consumption of 4½ kWh per day. It must be remembered that for such operations as Mr. Matthews described, the small petrol and paraffin engine was a close competitor with electricity. Such an engine would cost about £16 a year for fuel, a sum that was the sort of revenue a supply undertaking might expect to get from such a consumer. If they took the author's figure of 4d. a unit the Supply Company would get £30 or £40 a year, but figures which had been given before the Agricultural Commission showed that the earning power of a 150 acre farm was only £112 a year, so that every item of expenditure had to be carefully considered. Another difficulty was that the number of men employed on a farm was so small that unless one could be dispensed with altogether a great deal of saving was not achieved. He thought the greatest use of electricity on the farm was to be found in electro-culture. Here the difficulty again was that the consumption was so small that no supply undertaking would want to be troubled with it. If, however, it increased the crop production to an appreciable extent the farmer would be tempted to adopt it.

The Electrical Engineer as Farmer.

Mr. Bernard Jenkin was even more pessimistic than Mr. Atkinson as to the economics of electric driving on farms, this attitude being the result of seven years' experience as a farmer. He gave detailed figures showing the useful hours worked by horses in ploughing and other farm operations, and the useless hours worked in hauling empty carts and going to and from work. For such operations it seemed to him electricity was eminently unsuited. Electric ploughing equipment, for instance, would have to be hauled about the farm by horses and would take considerable time to instal in the various fields, an operation which would have to be repeated about every two days. On the other hand a steam plough or a tractor could move from field to field by its own power, and, while he agreed that electricity was useful for driving machines in or about farm buildings, a small oil engine did it just as well. His remarks about electric ploughs were equally applicable to electric threshing machines, which had to be taken into fields, and it was more economical to use a common threshing machine or silo cutter than for each particular farm to purchase one. As regards the electrification of crops, the difficulty was supporting the overhead wires. Production depended more on the farmer than the methods used.

Mr. Ayton in a New Role.

Mr. Frank Ayton, appearing in a new rôle, gave a short lecture on the design of plough-shares. It was a fallacy that the higher the speed of the plough the better the production. There was a well defined limit to the speed at which land could be economically ploughed, for as the speed was increased the pull required increased in a very much greater proportion. Increasing the speed also meant an increase in the size of the plough breast, so that while a breast 6 ft. long would be necessary at three miles an hour, that length would have to be doubled at four miles an hour. No demand for electric ploughs existed at the moment.

Electro-Culture in Practice.

Mr. J. E. Newman agreed that petrol was a formidable competitor to electricity for almost all jobs on the farm. Turning to discuss his own subject of electro-culture, Mr. Newman said he had first been attracted to the subject by Prof. Lemstrom's book, published by the proprietors of The Electrician. Very complete experiments which he had undertaken in Warwickshire over a period of ten years showed that by the use of electro-culture an increase in the crop production of over twenty per cent. could be obtained. This included one year of drought when there was no increase. These figures had been confirmed by the Electro-Culture Committee, but he did not regard them as the maximum increase that could be obtained. The point to notice was that it was possible to over-stimulate the crops, and it was also an open question whether in a dry

year negative electricity might not give better results than positive.

An Unusual Retort.

The hour had been late when Mr. Newman started, and was still later when he showed no signs of concluding. The President suggesting that some consummation might be advisable, Mr. Newman retorted that he was not used to that sort of thing. Perceiving the combined horror and amusement among the audience he hastened to explain that he did not refer to being pulled up, but to public speaking, and added that the best thing he could do was to sit down. This he accordingly did, and the somewhat pessimistically-toned entertainment came to a conclusion at a late hour.

The Discussion Continued.

When the discussion on Mr. Matthews' Paper was resumed on Thursday, the 6th, though the attendance was much diminished, this was more than compensated for by the note of optimism sounded by the various speakers.

Perhaps this was due to the fact that the President announced that he was looking forward to hearing that electricity could be used on a large scale on the farm. Farming was a very old industry, and though we were apt to think that scientific methods in connection with it were a modern idea, they were in reality exceedingly old. The Institute for Research in Dairy Farming had issued instructions for the milking of cows and for the preservation of milk in a clean condition. The Bunyaro tribe in Central Africa had similar instructions, with the addition that failure to obey them was punishable by death.

An Optimist at Last.

After the author had exhibited some further slides of electric farming apparatus, Mr. H. W. Richardson said he had hardly recognised the Institution of Electrical Engineers at the previous meeting. Many of the troubles that had been enumerated had been overcome in other countries, and could also be overcome by British electrical engineers. The position of electro-farming was now much the same as that of electric cooking and heating a few years ago, and there was, in fact, no wider field to which the industry could devote its attention. There were 418,000 farms in this country, and if 60 per cent. of them used 2 kW for five hours a day, that would be 1 000 000 000 kWh per annum. The annual consumption of electricity in farm buildings alone on the Continent averaged 10 kWh per acre, which meant more than the total number of units supplied in this country in 1910. Among the advantages of electro-farming was the milking load, which came on early in the morning and late at night and was greater in the summer than in the winter. Electric fans in the cowsheds meant a great degree of cleanliness. Manufacturers should pay attention to switchgear. With regard to electro-culture, he was of opinion that it operated owing to some action on the ground, and experiments might be tried to see whether the ground itself before the crops were sown would be stimulated by wires placed close to it. Many farms made more than the £112 per 150 acres mentioned by Mr. Atkinson; and a great deal could be done by co-operation.

Mr. W. R. Cooper said the difficulty was the conservatism of the British farmer. He would want to know the actual results in £ s. d. In dealing with the plant at the Harper-Adams College the author had said the consumption was 1½ kWh per acre, but no time was given. To show the commercial value of electro-culture the author might give the normal yields of certain crops per acre, and the normal value of the crop might also be indicated, whether the increase was for a certain crop or generally through each year.

Electro-Culture on the Continent.

Dr. J. F. Crowley said that an examination of the electro-culture results obtained on the Continent would make for optimism, but Continental methods and machinery would have to be re-designed for use in this country. There was an increasing demand for power plant on the farm, and experience on the Continent had shown that where electricity supply existed it could meet that demand. In some parts of southern Germany almost every farm used electricity. In Germany a heavy type of plough was used, and in France a much lighter one, probably an intermediate weight would suit this country best.

Electric Pig Rearing.

Mr. H. A. Carney said that to obtain low prices and cheap living we must have efficiency, and he looked to an extended application of electricity as the best method of bringing about the disappearance of inefficiency in farming. Electric lighting permitted the prolonged feeding of animals, and would therefore produce greater results than electro-farming. It was equally useful in pig rearing, where it was a great advantage to reduce the time, the pig being brought to maturity in four months instead of six, meaning a reduction in cost owing to the less consumption of food. The smallholder was in greater need of cheap power than the large grower, and electricity was the only sort of power that would fulfil his requirements. Even if such a man were capable of looking after a petrol engine, he would be spending time in engineering which would be better spent in farming.

Mr. L. G. Hyde said that when a suburban railway was electrified, more traffic was obtained, and the same result would be obtained in electrified farms, as experience in Germany and Sweden had proved.

Fact or Prophecy.

Mr. C. J. Hopkins said the Paper was a representation of what farms might be in the future, while Mr. Atkinson's remarks described what they were at present. If farmers could be induced to install electric lighting he was sure they would never want to dispense with it, and if one or two progressive farmers adopted electric working, the rest would follow. There was a chance for electric ploughing when the corn was shocked. Unbroken furrows were not required when ploughing was done to kill weeds.

Mr. E. K. Scott suggested that farmers might make their own nitrates by the arc process and so save themselves hundreds of pounds.

The Author's Reply.

The Author, in reply, said that more than half the output of electric motors on the Continent since the war had been for use on farms. This country was the chief centre of distribution for agricultural implements for the world, and we should, therefore, be in the van as regards electro-farming. On his own farm the cost of one horse, including a proportion of the driver's time, worked out at £147 per annum, and electricity at 2d. per unit would have been cheaper for work to which it was applicable. The object of using electricity should not be to decrease the number of men, but to increase the produce by more intensive farming.

The Properties and Uses of Micas.

A report on Mica Research covering the properties and uses of this material has now been issued by the British Electrical and Allied Industries Research Association. While a great deal of work has been done, and the investigation is by no means completed, as some of the results already obtained should be of immediate value, this report is issued.

Classification of Micas.

Great difficulties were met with owing to the absence of uniformity of nomenclature for the different kinds of mica. Considerable attention was, therefore, given to classification. The classification recommended by the Association is set forth in Table I., and it is urged that all investigators making tests on mica should adopt the nomenclature therein. Much of the work done in the past has suffered in value owing to the absence of adequate information as to the exact nature of the material tested. This will be appreciated when it is noted that the Association finds there are ten principal classes of mica and a large number of sub-varieties.

A large collection of representative micas has been prepared from materials supplied by F. Wiggins & Sons and Startin & Company, and the specimens have been named in accordance with Table I. This collection has been presented to the Institution of Electrical Engineers.

Table I.—*Trade Descriptions of Micas and Corresponding Characteristics.*

Class.	Mineralogical Group.	General Characteristics.	Relative Hardness.
Ruby	Muscovite.	Colour, pale reddish brown (ruby red in plates 15 mm. thick).	Hard.
Soft White	"Altered" Ruby Muscovite.	Slightly yellowish. Slightly calcined appearance.	Softer than ruby
Silver	"Altered" Muscovite.	Slightly calcined (silvery) appearance. Wavy surface.	Hard as ruby.
Green	Muscovite.	Inclined to have internal cracks.	In greater crystalline tension than ruby.
Brown	Muscovite.	Ditto.	Ditto.
Amber	Phlogopite.	Colour, very pale yellow to dark or opaque. Wavy surface. Great expansion at right angles to laminations.	Soft.
Altered or Silver Amber	Phlogopite.	Naturally altered amber. Colour same as unaltered amber, but more metallic. Silvery and opaque.	Softer than unaltered amber.
Black Amber ..	Biotite.	Very dark green or brown in thin sheets (about 0·003 in.). Black and opaque in thicker plates (0·01 and up).	More brittle than amber.
Lithia Mica ..	Lepidolite.	Light mauve, yellow gravish white or white. Will not stand heat and fuses at ordinary flame temperature.	Very hard and brittle.

Sub-Divisions.

Any class may, if required, be sub-divided as follows :—

Variety.		Quality.
Clear	Free from stains and spots (inclusions).	A. Free from all defects. B. Contains gaseous inclusions.
Slightly Stained	Free from spots (inclusions).	
Stained	Free from spots (inclusions).	
Heavily Stained	Free from spots (inclusions).	
Spotted	With solid inclusions.	

Specifications for Mica.

It has been found that the tests and characteristics required for mica which is intended to be employed for the various industrial uses have received very little attention in the past. It often happens, for instance, that the mechanical characteristics of mica are of a much greater importance than its electrical properties, but so far as has been ascertained these have seldom received much consideration, and there have been no generally recognised tests for mechanical properties. The suitability of the different kinds for high grade electrical work has never been investigated in a systematic way with a view to the definition of tests which can be applied for the purchase of materials for such purposes.

Specifications for mica too often fall back on the requirement that "only the best clear ruby mica shall be used," the obvious reason being the non-existence of any recognised tests to prove the suitability of the various classes of mica which might be available for the purpose in question.

In view of this absence of recognised tests, it has been found impossible to define with precision the test clauses suitable for a general mica specification, and the only course has been to schedule the principal uses to which mica is to be put, and for each of these uses to define the special characteristics required in the mica, leaving to further research the task of elucidating the standard tests to be applied for proving such characteristics.

Special attention has been given to the requirements of mica and micanite for commutators, and this is dealt with below.

Identification Tests.

Identification tests have been studied and are classified in Table II. A quantity of data has been obtained, but further study is required.

Preliminary researches have been made on the surface hardness of different varieties of mica, and whilst these tests are not promising as a means of classification according to kind, they may be of value in classifying according to use. Hardness and other mechanical tests are receiving further attention.

Table II.—*Identification Tests for Micas.*

The following are identification tests which may be supplied to micas described in Table I. :—

Calcining	Temperature at which calcination occurs.
Colour Characteristics....	Colour by diffused daylight (through thickness 0·5 mm.) in a direction normal to plane of plate. Nature of surface. Foreign matter (inclusions).
Optical	Axial angle and relation of its plane to the plane of symmetry. Percentage absorption of light.
Chemical	Nature of surface after acid treatment.
Electrical	Dielectric constant (Sp. Ind. Cap.). Dielectric loss.

Selection of Micas.

The numerous uses of mica in the electrical industry, as, for example, in commutators, condensers, sparking plugs, and pyrometers, have been classified, together with the appropriate characteristics so far as these are known.

A study of the above has already shown that certain kinds of mica are peculiarly suitable for certain purposes, and that the range of kinds suitable for some purposes is larger than has been recognised. Preliminary suggestions are made in Table III. which should prove of immediate service, but much further research is necessary to complete the schedule and to establish definite limits for purchasing purposes.

Table III.—*Micas Suitable for Specified Purposes.*

Commutators.	
Flush Segments	Amber and Silver Amber. Green and Brown.* Certain Grades of Soft White.
Undercut Segments	Any sound micas which will cleave readily.
Rings and Cones	Black Amber.*
Wrappings, Channels, Tubes and Washers.	
Extra High Tension	7 000 V and over: Ruby Clear A and B. Below 7 000 V: Any mica not spotted.
High Frequency	
Condensers.	
High Frequency ..... (above 2 000)	Ruby Clear A. Green or Brown Clear.* ,, ,, B, not considered suitable.
High Temperature Purposes.	
Spark Plugs	Ruby Clear, Ruby slightly stained or stained.*
Pyrometers	Green or Brown.* Ruby Clear A, and possibly other micas.*
Furnace Work	*Insulation:* Any mica which has the necessary mechanical characteristics. *Arc Resisting:* Muscovite where mechanical requirements predominate. Phlogopite where ability to resist great heat is required.
Heating and Cooking	Muscovite where mechanical requirements predominate. Phlogopite where ability to resist great heat is required.
Mechanical and Optical.	
Diaphragms	Lithia mica. Ruby Clear A.†
Windows and Spectacles .	Any clear mica.
Dials, Vanes, and Compass Cards.	Any uniform flat mica.

* Subject to research.

† Subject to research, especially in regard to fatigue.

Mica and Micanite for Commutators.

The leading manufacturers of commutating machinery have furnished full information of their practice and experience, and this has been reviewed in detail. A number of representative large users of commutating machinery have also been approached, their experience ascertained and opinions carefully sifted, As a result the Association is now able to present a comprehensive statement of facts ascertained. It is doubtful if any further conclusions can be reached on the evidence now available, but the Association has still in hand experimental work which should throw further light on some of the problems which have to be faced.

Commutator Segment Separators.

Pure Mica.—The material used for pure mica commutator segments is mostly stained and spotted, brown and green, light and dark in colour. Soft white and amber is also largely used. Separators in one length are obtainable up to about 16 in. or more, but on first cost it pays to use built-up material or micanite when the length needed exceeds about 6 in. In the smaller sizes pure mica is cheaper than micanite.

Built-up Mica.—With built-up separators, the pieces being stiff, a good deal of adhesive is required, and it is questionable if there is much benefit as compared with the use of a micanite specially made for the purpose. The built-up segment is preferred by some designers who have had trouble with micanite. It is essential to use a minimum of adhesive so that the material shall not " give " when hot.

Micanite.—Micanite separators should not contain more than 2 or 3 per cent. of adhesive, whereas ordinary micanite may contain 10 to 15 per cent. The micanite is made from clear mica, and from amber mica where called for. There is no reason why micanite for separators should not be made from spotted and stained mica, supplies of which are readily available. The price of clear mica is 100 per cent. more than spotted and about 25 per cent. more than stained.

Flush and Undercut Mica Separators.

Some makers undercut all commutators, but flush segments are still largely employed, especially on small machines, where hard brushes are used. Commutation on most modern machines is so good, that the machine may run for years on the first undercut. On important machines, however, where soft brushes are generally to be found, some makers use soft separators, so that, even if the commutator is worn down and undercutting is neglected for a time, trouble will not ensue, and are willing to pay the extra cost of amber mica to ensure this result. Where flush separators are used, the buyer sees the material is uniform and not too hard. The danger from hard spots is greatly reduced where the separators are built up in any way. Further research is in hand on the abrasive hardness of mica in order to determine what micas will give satisfaction with flush separators.

Mica versus Micanite.

From information obtained from large users and leading manufacturers of commutating machinery, the following conclusions have been arrived at with regard to the relative merits of the use of pure mica, built-up mica or micanite.

All three kinds of separators can be obtained finished to a sufficient degree of accuracy for the purpose. In general * 1 mil can be guaranteed without difficulty on mica segments and * 2 mils on built-up mica and micanite, but micanite is bought also under guarantee of * 1 mil. Pure mica makes the best mechanical job, is less liable to flake or change under the influence of heat. Micanite properly compressed and with a minimum of adhesive is successfully and extensively employed in both large and small machines. It is cheaper, except in small sizes. The cost per square foot varies but little with the size, so that in large sizes considerable saving may be effected. It is less liable to give trouble through hardness and is free from hard spots. Difficulty has been experienced where oil has got on to the micanite as the oil and adhesive together get carbonised, necessitating taking the commutator apart to remedy the defect. This applies also to built-up mica. This trouble, however, is one within the province of the designer to remedy and the user to avoid.

Rings and Cones: Materials Employed.

Rings are sometimes made up of the more flexible grades of mica butt-jointed or lap-jointed, but micanite is the principal material employed, the cones being built up from suitably cut pieces stuck together and pressed hot into shape. The adhesive left in may be of the order of 10 per cent. The thicker splittings are cut from block, but the thin splittings are the regular article of commerce.

Thin Splittings.

Splitting of Indian mica is more cheaply done by Indian labour, before shipment to Europe. It is a trade developed solely for the electrical industry, and the tendency of the individual buyer to play for safety in a matter over which he has no control and imperfect information, has resulted in the supply consisting almost exclusively of clear mica, whereas for many purposes there is no doubt that stained, spotted and dark coloured material could be used with considerable economy in first cost.

The Association is not prepared to make definite recommendations until the results are available on the nature and incidence of inclusions and impurities in mica from the electrical standpoint, showing their effect as conductors on breakdown voltage, surface leakage and dielectric losses. Research on this is now being put in hand.

Belfast's New Electrical Engineer.

Belfast City Council have appointed Mr. Johnstone Wright, M.I.E.E., of Bradford, to the post of city electrical engineer and business manager, at a salary of £1 400 per annum, in succession to Mr. T. W. Bloxam, who has retired on superannuation. There were five candidates on the short list—Mr. Wright, Mr. P. J. Robinson (Liverpool), Mr. C. W. Salt (Carlisle), Mr. Edwin E. M'Kenzie (chief engineer of staff of Charles P. Sparks & Partners), and Mr. Robert Owen (Wigan). Mr. Robinson withdrew his application, having made a new arrangement with Liverpool Corporation.

Mr. Wright received his general education at Perth Academy and his technical training at Glasgow Technical College. He served a five years' apprenticeship with D. Stewart & Company, Glasgow, passing through the various departments of their works, including the pattern shop, outside erection, and drawing office. In 1903 he left Glasgow to join the staff of the British Electric Plant Company (Alloa) as testing engineer, and was subsequently promoted to take charge of outside contracts. He was appointed assistant electrical engineer to the Oban Corporation in May, 1905, and held this position until December in the following year, when he joined the staff of the Cleveland & Durham Electric Power Co. This company were then just about to commence giving supply, and during the following thirteen years Mr. Wright filled several important positions with them, and took an active part in the whole development. He supervised the erection of five waste-heat power stations and large extensions to coalfields stations, including the Newport station, Middlesbrough, which was the first station erected to operate entirely upon exhaust steam by any public service undertaking in this country.

When the Newcastle-on-Tyne Electric Supply Company acquired a controlling interest in the Cleveland Company, Mr. Wright was appointed superintendent engineer for the ten power stations operated by the Cleveland and Durham Company, and held this position until September, 1919, when he was appointed chief assistant electrical engineer at Bradford. In June, 1920, he was promoted to the position of deputy city electrical engineer, since when the plant has been practically remodelled throughout and large extensions have been made, including the installation of two 15 000 kW turbo-alternators. A third set has been provided for, and will be ordered in the near future. A complete new boiler house is at present under connear future.

The Ignition of Fire-Damp.

After the reading of a paper on " Stainless Steel " by Lt.-Col. H. Rhodes, before the Midland Institute of Mining, Civil and Mechanical Engineers at Barnsley on Saturday, there was a discussion on Prof. R. V. Wheeler's recent paper on " The Ignition of Fire-Damp." Replying, Prof. Wheeler said that there was a need for further experiments on a larger scale, so that they could know one way or another whether it was possible to get an ignition of fire-damp by means of frictional sparks. With regard to the suggestion that the flame lamp was a danger, it did not follow as a natural law that they must exclude the flame safety lamp. The inventor of an electrical device for the detection of fire-damp (Mr. Williams) had brought his apparatus into a convenient and practical form. It had already proved capable of accurately indicating the presence of fire-damp, and was, therefore, quite a suitable substitute for the flame lamp. The only point against this was that this form of electrical fire-damp indicator would only show the fire-damp if this was looked for, whereas the flame lamp gave warning of fire-damp.

The members spent the morning in visiting the works of the Ceag Miners' Supply Company, Ltd., manufacturers of electric safety lamps for mines. This firm, which has been in existence for three years, was originally a German concern, the shares of which were bought by the present company from the Public Trustee. It is now an all-British firm, with Messrs. R. J. Plummer and C. A. Longbottom as directors. At the Barnsley and their other works the company turn out 700 lamps complete a day.

Salford's Electricity Supply.

Salford Town Council have agreed, on the recommendations of the Special Committee appointed to reconsider the question, to continue with the erection of the super-generating station at Agecroft, a suggestion of the Lancashire Electric Power Company to obtain a bulk supply from Manchester's Barton station being rejected. It has also been decided to retain the services of Mr. J. A. Robertson as engineer to design and construct, &c., the new station at an inclusive remuneration of £14 000, plus travelling expenses. Mr. Roberston is also to be retained for twelve months, as from the 1st inst., as consulting engineer in connection with the existing electricity undertaking, at an inclusive fee of £500, plus travelling expenses.

OBITUARY.

Sir John Benn, Bart., D.L., J.P., L.C.C.

We greatly regret to announce the death, on Monday, April 10, of Sir John Williams Benn, Bart., D.L., J.P., L.C.C., of "Stone Wall," Limpsfield, Surrey.

Sir John Benn, "Father" of the London County Council, and Chairman of Benn Brothers, Ltd., was seized with hemorrhage of the brain on March 31, and succumbed ten days later to pneumonia. He was in his seventy-second year.

Eldest son of the Reverend Julius Benn, Sir John, who was born at Hyde, in Cheshire, started his business life in London as an office boy, and rose to be the head of the firm of Benn Brothers. Ltd., the Leader of the Progressive Party in London, Chairman of the London County Council, Deputy-Lieutenant for the County of London, a Baronet and a Member of Parliament. His career in Parliament was confined to the years 1892 to 1895, when he represented St. George's-in-the-East, and 1904 to 1910 when he sat as the member for Devonport. He was the last survivor amongst serving members of those who were elected in 1889 to the First London County Council, of which Lord Rosebery was Chairman. Twelve months ago at a luncheon given in his honour as "Father" of the L.C.C., his thirty-two years of municipal work was referred to in a message from the King, which expressed His Majesty's interest and pleasure at hearing of the recognition of Sir John Benn by his friends and admirers for his long service in the government of London.

Sir John Benn, Bart.

A Romance of Journalism.

When questioned about the foundation of the firm of which he was the head, Sir John Benn always attributed it to his love of drawing. The story of the inception and launching of "The Cabinet Maker" in 1880 is, indeed, little short of a romance, the more so because of the complete justification which later years brought to the young enthusiast who had, in fact, sacrificed all he possessed to an ideal. As a youth John Williams Benn recognised the importance of cultivating his artistic talent, and by studying at South Kensington and devoting most of his youthful leisure to the subject he acquired a very thorough knowledge of architecture, decoration, and furnishing. To supplement his abilities on the technical side he served successively as draughtsman, salesman, manager, and eventually partner in a large furniture manufacturing concern. During this time he was a constant contributor to "The Furniture Gazette," and reviewed and illustrated the furnishing side of the Paris Exhibition of 1878. He subsequently abandoned cabinet manufacturing for journalism. It was a bold step and regarded at the time by cautious friends as highly imprudent, but it was characteristic of Sir John, who all his life had a habit of taking risks in pursuance of cherished ideals. Those were the days of the worst features of Victorian furnishing, and the young journalist consistently advocated a return to tradition and a development of the eighteenth century work of Chippendale, Heppelwhite, and Sheraton.

At the outset most of the illustrations in "The Cabinet Maker" were the work of Sir John's own hands, and he was later joined by his brothers Julius Taylor Benn and R. Davis Benn, both of whom have passed away, and Mr. H. P. Benn, who survives him. They devoted their attention to the business which their elder brother had founded, and left him free for his municipal and Parliamentary activities. Sir John lived to see the business which he established grow to be the largest trade and technical publishing house in the country. He had, in spite of the calls on his time made by his public work, found time to inspire, if not to direct, constant fresh developments in the firm of which he was the Chairman.

Expansion of the Business.

In 1900 "The Hardware Trade Journal" was purchased, and immediately became a power in the industry it represents. This was followed at short intervals by "Marine International Engineering" and "The Export World." Among the properties which have been acquired may be mentioned "Ironmongery," "Commercial Intelligence," and "El Comerciante." More recent developments include the acquisition of The Electrician, "The Fruit Grower," "The Gas World," "Farm and Home," "Gardening Illustrated," and "The Chemical Age." Side by side with the growth in the trade and technical journal publishing business there has also been developed a very large business in the highest class of technical and art books. This department first confined its attention to the well-known series of standard books dealing with electricity, gas, horticulture, cabinet making, and aeronautics, but more recently it has published fine art books in every branch of science, technology, and art.

A Pioneer of London's Tramways.

Apart from his connection with the electrical industry as proprietor of The Electrician, Sir John Benn will best be remembered by our readers as an ardent advocate of electrical tramways for London. For initiating and carrying through a forward policy for a municipally owned system, he displayed all his talents of enterprise and vision and soon succeeded in bringing London level with other large cities in this respect. It is not to be wondered at that many of the necessary changes were only effected after considerable controversy. The adoption of the conduit system was admittedly at that time an experiment, while the trolley system had been well tried out. The former was also more costly, and at first its operation gave considerable trouble. But, taking into account the special conditions of tramway working in London, it may now be said that the experiment was justified.

Sir John Benn's name will also be remembered in connection with his denunciation of the surface contact system, which was experimentally adopted in the Mile End Road against his advice. Certain letters which he addressed in 1908 to the *Times* and *Daily Chronicle* on this subject involved him in a libel action with the inventors. A special jury awarded the plaintiffs £12 000 damages, but Sir John was successful in having the verdict set aside in the Court of Appeal.

Connection with the Argentine.

Sir John Benn travelled widely and took a leading part in the Argentine Centenary Celebrations in 1910, traversing the whole of the continent to the Pacific coast. He was frequently abroad at the art centres on the Continent in search of material for the pages of the journal which he founded.

In the year 1874 he married Lily, the youngest daughter of the late John Pickstone, of "Silver Hill," Hyde. There were three sons and two daughters of the marriage. Of the former Mr. Ernest J. P. Benn, the present managing director of Benn Brothers, Ltd., succeeds to the title, Captain Wedgwood Benn, M.P., D.S.O., D.F.C., is Member of Parliament for Leith, while the youngest son, Captain Oliver Benn, was killed in Gallipoli in 1917. Lady Benn, who survives Sir John, has been an enthusiastic supporter of his public work.

Those of us who carry on the business which Sir John founded have sustained a great blow by the loss of his inspiring personality. He was amazingly versatile, successful not only as a newspaper proprietor and publisher, but in many other walks of life as well. During his allotted span of life he has played his part as a designer, playwright, lecturer, artist, journalist, sportsman, as one o the most energetic political personalities in London, and as the friend of hundreds of people who will sincerely regret his loss.

The funeral will take place at noon to-day (Thursday) at Limpsfield, Surrey. A memorial service will be held at the same hour at Christ Church, Westminster Bridge Road, London.

Correspondence.

TRAMWAY CHANGE-OVER ARRANGEMENTS.

To the Editor of THE ELECTRICIAN.

SIR,—During a recent trip abroad my attention was drawn to the very simple arrangements in use in the streets of Paris for changing from the underground conduit system to the overhead trolley. This seems such an improvement on the practise in and around London that I am astonished it has not been adopted by the London County Council.

At the present time many, I was going to say most, of the streets in Paris are under reconstruction in some way or another, and this necessitates the diversion of the trams off the centres of the boulevards and main streets for longer or shorter detours. There are also many points where the overhead and underground systems meet all round the centre portion of the town.

There is also, at least, one point where the cars cross from the south side of the river on to the Place Notre Dame, where they not only carry overhead collecting and conduit gear, but are also fitted with batteries to pass over certain gaps between the two systems where neither are possible. Here if I am not mistaken it is customary for the "skate" to be entirely taken off the cars at points of change over, and this occupies some time.

In Paris at each of these connecting points the conduit is provided with two hinged doors operated by a "point" lever. On the car coming to rest the man in charge of the points takes the controller key from the driver, opens the doors which are now under the body of the car, disconnects the skate electrically by means of a switch on the under side of the car for which he has a key, and with another key raises the skate till it lies parallel under the car, by means of a worm or rack, so that the skate is still fixed to and carried by the car, but clear of the track in every way. Meantime the conductor has released the trolley and got it on to the overhead wire. The key is then given back to the driver and he can proceed. The whole business takes less time than it has taken to describe and I repeatedly timed it at between 30 and 35 seconds from the time of stopping to starting again.

The men did not seem to be hurrying themselves in the least, and frequently found time for a joke, especially when the conductor was a woman as was frequently the case.

I do not know if this letter is of sufficient interest for you to publish it, but I should like to know how it comes about that we are so backward in our developments on the conduit system which I believe was first introduced in London.—I am, &c.,

Watford, April 8. M. J. E. TILNEY.

New Railway Rates for Electrical Goods.

For some time past the Railway Rates Advisory Committee of the Ministry of Transport has been considering the NEW RAILWAY RATES CLASSIFICATION proposed by the railway companies, and has been hearing objections by various traders concerning particular classes of goods. Under the present classification goods are divided into eight classes, leaving out of consideration exceptional rates in special cases, and the railway companies now propose that there should be twenty classes, Class 1 being the lowest rate, the rates increasing as the numbers progress. The question of the general classification of machines and machinery has been before the Committee, and after careful consideration it has been decided that machines and machinery should be charged at the Class 12, 14 and 16 rates, i.e., Class 16 for consignments of less than 2 tons. Class 14 for consignments between 2 and 5 tons, and Class 12 for consignments of more than 5 tons. This leaves it open for objections to be made in respect of particular goods.

During the hearing of a number of objections on Thursday, April 6, MR. BROADBENT, of the British Electrical and Allied Manufacturers' Association, brought up the question of iron-clad switchgear and meters for electric lighting and power. In the first place, with regard to the switchgear, he asked for concessions with regard to packing. With the development of the trade, he said, various descriptions had crept into the classification which were causing considerable confusion between railway companies and traders. The B.E.A.M.A. considered it was time for grouping certain types of articles under the one generic heading of iron clad switchgear Owing to the increased pressures now employed, and the very severe conditions imposed upon the electrical trade by insurance companies, the Home Office, and the Board of Trade, switchgear was now very much more robust than when first classified. This branch of the industry had grown tremendously of late years, and the Association had collected data from the principal manufacturers over a period of twelve months, which showed that the traffic in iron clad switchgear during that period was 15 752 tons. The average rate per ton was £3, making a total of £47 256 paid in carriage. The claims on that amount of switchgear were only £504 5s. 1d., or 1 per cent. of the amount paid in carriage, and the bulk of the goods were carefully packed. Switchgear provided good loading, up to 4 or 5 tons per truck, and the traffic was of a regular character. The Association suggested that there should be an entry in the new classification for "iron clad switchgear, with or without meters, Class 18." The shipping companies had agreed to class switchgear for use in connection with dynamos and motors as electrical machinery. Therefore, the Association would have been justified in claiming the machinery rates for switchgear from the railway companies. Mr. Broadbent explained that non-recording meters to-day were carried at Class 3 rates, equal to Class 18 in the new classification, and recording meters at the present Class 4 rate. The trouble was that when a switch was sent with recording meters—iron clad switch gear was at present in Class 3—it would have to be sent at a higher rate.

MR. PIKE, representing the railway companies, said that apparently they were asked to include meters with iron clad switchgear. He pointed out that meters were delicate pieces of machinery, and it was not reasonable that they should be included with switchgear, which was less damageable.

MR. BROADBENT, dealing with meters, said that the trade suffered severely from American and Continental competition. The Association had obtained information from ten of its members who specialised in meters, and had found that in twelve months 740 000 instruments had been sent, representing a tonnage of 3 100. including packing. The average rate was £3 per ton, making £9 300 paid in carriage. Owing to the very efficient methods of packing the claims for damages on that amount did not exceed £50, or about half of 1 per cent. of the freight cost. The railway companies proposed that meters should be in Classes 19 and 20 in the new classification, for the non-recording and recording types respectively. This represented an increase on the present rates, and he contended that the rates should not be raised. He handed to the Chairman a number of meters to show that they were quite strong, and not very liable to damage.

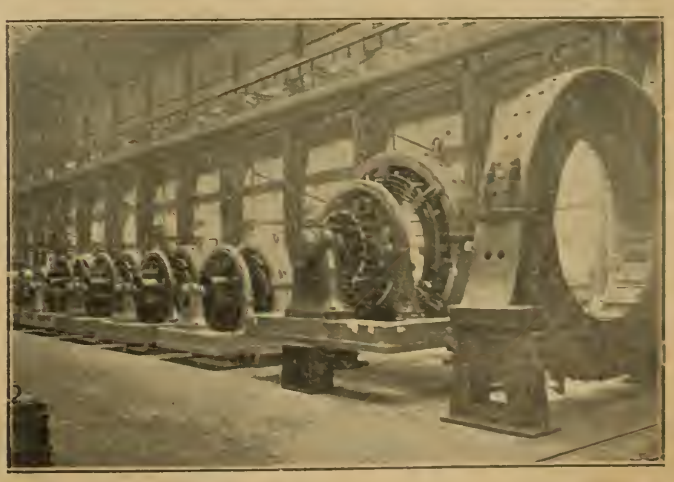
MR. PIKE said that the meters were first put into Class 3 of the present classification. The companies had applied to the Board of Trade, who had put them into Class 4, the entry being "Electrical Instruments for Electric Lighting and Power." The railway companies had asked for Class 5.

THE COMMITTEE said the classification should be maintained in both cases. Switchgear, iron clad, sent without meters, should be at the rate proposed by the railway companies, but with meters they should go at a higher rate, as proposed by the railway companies. With regard to the meters themselves, these should be in Classes 18 and 19 for non-recording and recording respectively, and not 19 and 20, as proposed by the railway companies.

English Electric Rotary Converters.

The illustration shows a number of rotary converters in various stages of construction. The frame on the right-hand side belongs to a very heavy current low-voltage machine designed to give a supply for rolling-mill work. The armature belonging to it can be seen at the extreme left-hand side of the photograph. This is designed to carry about 6 000 A, and the special double commutator construction can be clearly seen.

Next to the frame of this machine are a number of parts of a 1 500 kW machine for municipal service, designed to run at 428 revs.



A GROUP OF ENGLISH ELECTRIC ROTARIES.

per min., and still further to the left can be seen machines of 1 100 kW, 1 000 kW, 500 kW, 250 kW, and 200 kW.

In addition to the above, four or five more machines were running on the test bed at the time the photograph was taken, varying in output from 1 500 kW down to 200 kW.

We understand that the ENGLISH ELECTRIC COMPANY intend to build all their rotary converters for industrial or municipal service at the Siemens works, Stafford. Another part of the same works is devoted to the manufacture of the whole of the a.c. and d.c. switchgear for the rotary converters, while the step-down transformers for working in conjunction with the converters are manufactured by the company at their Coventry works.

Industrial Research.

The several researches undertaken by the British Electrical and Allied Industries Research Association are now reaching the stage at which a number of reports and technical publications can be announced, and several more will shortly be available. The publications on insulating materials include one giving instructions for the study of untreated papers for purposes other than cable manufacture. A full account of the researches on which these instructions are based is also to be published. In addition, there are similar reports upon the mechanical and physical testing of press-boards, press-spahn, &c., and on vulcanised fibres. The electrical testing of fibrous insulating materials is covered comprehensively by another publication; the scope of the research on electrical tests of all these materials is being extended to include standardised methods suitable for all insulating materials. Sheets, rods and tubes of composite insulating materials are dealt with in another publication. The researches upon which this is based have already proved of great value to the co-operating manufacturers, and marked improvements in their products are reported; a full account of these researches will shortly be issued. Work on the composite class of insulators (still under consideration), include the evolution of test methods for fire and heat-resisting properties, the practical application of these methods to materials on the market, and work on moulding properties and on the action of solvents and hot oil.

Synthetic Resins.

The Committee on synthetic resins has prepared a technical publication giving directions for the study of synthetic resin varnish-paper and varnish-fabric boards, and also reports on the possibility of establishing and safeguarding in this country manufacture of raw materials for these resins. Other work in this section includes a report on the requirements of Government Departments with reference to synthetic resin products, and tests upon moulded products. Samples of varnish-paper and varnish-fabric boards and of moulded products are being collected.

Mica for Condensers and Commutators.

The uses of mica for condensers and commutators is the subject of a report issued by the committee on mica and micanite. The report deals with the classification, identification and properties of mica; investigations are still proceeding on the mechanical and electrical tests of various kinds of mica. Steps have been taken to clear up the existing confusion in the classification, manufacture, and use of micanite, by bringing in close touch all parties interested in this material.

Insulating Oils.

The researches on the electrical strength and resistivity, and on the thermal properties of insulating oils are progressing. The former are to be carried out in close co-operation with Professor J. A. Fleming at London University, where a programme of research has been mapped out. In addition to these specialised researches on insulating materials, the general researches on dielectrics are being actively pursued. New work in this direction includes an investigation of the cathode ray tube as an instrument for the measurement of dielectric losses at high frequencies, and an examination of these losses at high voltages by the use of an electrostatic wattmeter.

Conductors.

Three reports are in preparation in the section dealing with conductors. The first will clear up outstanding points on the heating of buried cables, except dielectric loss problems; the second report will suggest material improvements, arising out of tests on standard wood poles for overhead lines. The third report in this section will treat with test results obtained on long overhead copper cables; the work on aluminium and steel cables is nearing completion.

Electrical Control Apparatus.

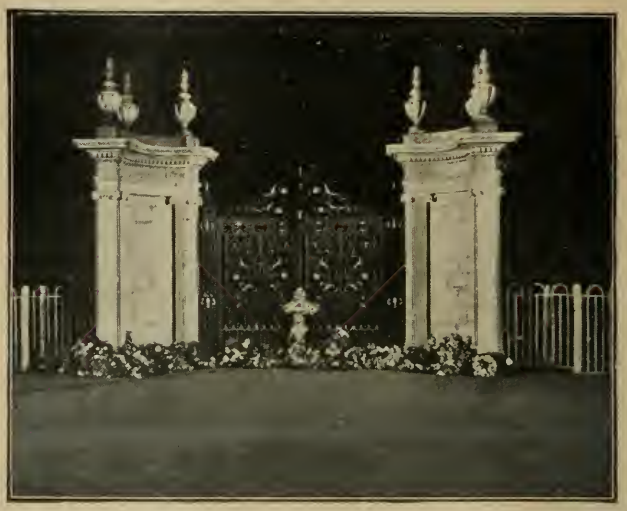
Several valuable researches, on a practical scale, are progressing in connection with electric control apparatus. These include tests on oil circuit breakers (for which the 6 000 kW alternator has now been prepared and its characteristics determined), on mining switch gear, fusible cut-outs and air-circuit breakers for d.c. This last research has the practical co-operation of the London County Council and the London and North-Western Railway Company, Ltd. A forthcoming paper by the National Physical Laboratory is also announced, giving the results of tests on the conductivity of joints in copper and aluminium bars.

Turbine Blading.

Recent researches on stainless steel have necessitated a revision of the programme previously mapped out for research on turbine blading. Good progress is reported in the tests on turbine nozzles at Manchester University. It is interesting to learn that Professor Callendar is undertaking researches on turbines and on the properties of high-pressure and high-temperature steam. Amongst the miscellaneous researches and new enquiries undertaken by the Association may be noted tests on the relation of the permissable variations of supply voltage to "flicker" of incandescent lamps, conferences with Government Departments on accumulators and batteries, and researches on the wave-form of generators. A full review of the progress of all the activities of the Association may be found in the Quarterly Progress Report for April.

Rugby War Memorial.

For three nights after the recent unveiling by Field-Marshal Lord French of the War Memorial Gates at Rugby they were flood lighted by the British Thomson-Houston Co. The lighting was particularly effective in this case, as, by day the beauty of the gates, owing to their surroundings, is liable to be overlooked. For the lighting, two B. T.-H. Floodlight projectors, equipped with



Rugby War Memorial Gates.

"Mazda" gasfilled lamps were employed, and to avoid any unevenness of light which might be caused by the reflection of the lamp filament diffusing mirror reflectors were used, which, in addition to reflecting the light, break up the rays in such a way as to eliminate striation. To keep the illumination within the limits of the monument, each projector was fitted with a spill shield—a device specially designed to give a definite cut-off to the beam.

The Greater London Scheme.

We regret to notice that attempts are being made by some of the local authorities in London to organise opposition to the draft scheme of the Electricity Commissioners for the Supply of Electricity in Greater London. A private conference was held at the Town Hall, Bermondsey, on Friday last, to which the Borough Councils of Poplar, Bethnal Green, Stepney, Hackney, Southwark, Woolwich, Shoreditch, Camberwell, Deptford, Greenwich, Lambeth, Lewisham, Stoke Newington, and Bermondsey; the Town Councils of West Ham and East Ham; and the Urban District Councils of Walthamstow, Ilford, and Leyton were invited. The agenda included consideration of the scheme, and also the steps necessary for securing the reversal of: (1) Over representation of private companies, (2) the complete ignoring of the claim for Labour representation, (3) the failure to examine the advantages which may accrue if the existing undertakings were thoroughly reorganised, (4) the refusal of the Government to advance loans for schemes involving large expenditure of capital that are problematic regarding their utility, (5) the extension of tenure as part of the settlement with the private companies throughout London.

Some of those invited (including Stepney) did not attend, as it was considered that the existing conference of local authorities was the properly constituted body to deal with the question.

A Large Electric Steam Generator.

The Belgo-Canadian Pulp & Paper Company is, according to the "Electrical World," producing its process steam with a 20 000 kW electric steam generator; 60 000lbs. of water are being evaporated per hour with a thermal efficiency of 98 per cent., including losses, in 100ft. of piping. It is reported that the company is saving $4 000 per month with the new system, which saves 75 tons of coal a day. Installation costs (about $25 000) were 40 per cent. less than the cost of the coal-burning plant replaced. Three-phase, 6 600 V power from the Shawinigan Water and Power Company is utilised directly in the tanks. The amount of steam generated and the pressure and amount of power used are governed by the depths of immersion of the electrodes in the tanks. Already generators of this type, with a total rating of 100 000 kW, have been installed or contracted for, according to F. Hudson, president of the Electric Furnace Construction Company, Philadelphia, who thinks that the most important applications of electric steam generators will probably be in industries situated within convenient transmission range of hydro-electric plants. Where savings in initial cost, space occupied, and operating expense are important the electric steam generator will have, it is claimed, many points in its favour.

Latin-American Engineering Notes.

A commission of engineers has been appointed by the Bolivian Government to consider plans for the ELECTRIFICATION OF THE YUNGAS RAILWAY, in Bolivia. At present the line is of little importance, only two passenger trains and one freight train being operated daily. The cost of electrifying the line, with a view to future development, and providing 1 800 H.P., is estimated at 246 000 gold dollars (£49 200).

Work has almost been completed upon an electric plant in the city of Léon, Nicaragua, power being derived from a waterfall in the vicinity. The plant will supply all the streets and buildings with electricity.

In Ypacarai, Paraguay, an electric plant has been installed, the first of its kind, which it is hoped to duplicate in a neighbouring town at an early date.

The town of Comayagu, in Honduras, is completing an electric light and power station, while a contract has lately been entered into for the construction of a new radio station in the neighbourhood.

A new 536 H.P. 400 kW turbine has been added to the existing electric light plant installed at Maracaibo, Venezuela.

It is expected that the electrical plant of 2 000 kW capacity, under construction in Cardenas (Republic of Cuba), will be completed this month.

Satisfactory progress has been made with the erection of the two electric Gronwal furnaces, each of 3 000 kW capacity, now being installed by a Brazilian metallurgical company, which holds the exclusive Brazilian rights for this furnace.

After considerable competition, the contract for lighting the grounds of the Brazilian Centennial Exhibition has been awarded to the General Electric Company, of New York, the estimated cost being $1 000 000 (£200 000). The company's chief engineer (Mr. W. D. O'Ryan) is in Brazil, making the necessary arrangements for starting the work. Mr. O'Ryan directed the illumination services of the San Francisco Exposition.

An electrically operated converter plant for refining all the matte and copper blister on the spot, instead of shipping it abroad for refining, is being erected at Santa Rosalia, Lower California, at a cost of over $1 000 000 (£200 000).

In Costa Rica a contract has been signed for the purchase of land for the construction of an electric light and power plant for the municipality of Alajuela and the surrounding towns. The installation contract has not yet been awarded.

REUTER'S TRADE SERVICE.

London Traffic Reform.

A long report on the present position of the LONDON TRAFFIC PROBLEM was presented to the London County Council on Tuesday by the Highways Committee. The time is considered opportune for raising the matter again, inasmuch as the Treasury have agreed to guarantee interest on the capital which will be expended by the Underground Electric Railways Company of London on widening and extending the tube railways. The report deals at some length with the various efforts made by the County Council to improve its tramway system and to co-ordinate traffic arrangements in Greater London. Extracts from the reports of the Royal Commission on London Traffic, Select Committees, &c., are included, and statistics are also given of the passengers carried by the tramways, omnibuses, tube and other railways in order to show the importance of the facilities offered by the tramways and the effects of competition.

The Committee state that, although they have been influenced in submitting the statement with regard to the present traffic position in London primarily by reason of the announcement recently made of the guarantee proposed to be given by the Government to certain enterprises of the underground companies, they have also felt that on other grounds the time has arrived for seeking from the Government a clear declaration of its policy and intentions on a question that is all-important to the people of London. They regard the matter as one of such pressing urgency that they think the time has arrived when the Council should place the position before the Government, and ask it to take the matter in hand without further delay, without indicating in any precise way the action which the Council suggests should be taken to provide a remedy for the present difficulties. Therefore, they recommended that the attention of H.M. Government be again directed to the resolutions of the Council on the subject of London traffic arrangements; that the Government be informed that, in the opinion of the Council, the organisation of London traffic on satisfactory lines is endangered by the continued delay in adopting measures to give effect to the repeated declarations of Royal Commissions and Select Committees as to the pressing need for reform; and that the Government be further informed that the Council considers that the difficulty of reaching a settlement of the traffic problem as a whole will be enhanced by any steps that may be taken by the Government that have the effect of assisting particular traffic undertakings operating in London and the surrounding districts, without recognising the essential community of the traffic interests of the entire area.

The INTERNATIONAL RAILWAY CONGRESS, the first to be held since 1910, will take place at Rome from the 18th to the 28th inst. Every aspect of railway and light railway construction and administration will come in for consideration, and reports will be presented on the technical and financial sides of electric traction. There will also be papers and reports on permanent-way construction, locomotive design, signalling, &c.

Electrical Plant for Japan.

Referring to the recent large contracts secured by the Metropolitan-Vickers Electrical Company, in connection with the electrification of the South African railways, a correspondent of the "Manchester Guardian Commercial" states that: "Further large contracts could be secured if British firms would turn their attention to Japan. The greatest open market in the world to-day for high-grade electrical apparatus lies in the project of the Japanese authorities for the ELECTRIFICATION OF THE IMPERIAL GOVERNMENT RAILWAYS and in the schemes for hydro-electric developments throughout the empire. The estimated cost of these plans is $1 000 000 000 (gold).

As Japan may be unable to carry the load of financing these huge new industries there is a hope in Japan that past successful Anglo-Japanese co-operation will now be reciprocated in part by British participation in financing the projects. The Japanese promoters are ready to offer bonds paying 10 and 12 per cent. on the investments, which are both substantial and stable.

Water power is not a new experiment in Japan. It has been utilised for centuries in a primitive way. Modern hydro-electric plants are now seen perched on the hillsides draining the maximum amount of power out of the many small but swift rivers. Over 1 000 000 kW are furnished from this source for railways and industries. Even when this amount of energy is enormously increased as planned it will not, according to Mr. Kyuchi Hasegawa, chief of the Rivers Section of the Home Department, supply enough power to dispense with coal for power purposes."

According to the "Yokohama Chamber of Commerce Journal" the Electricity Bureau of the Department of Communication has reported a striking development of the electrical industry in Japan in 1921. In the investment in the industry there was an increase up to the close of October of approximately 166 million yen.

At the end of October, 1921, there were 830 electrical enterprises including 728 electric power supplying concerns, 52 electric tramways and railways, and 50 other companies transacting similar business. The total number showed a decrease of four as compared with the close of 1920, which means the consolidation of electrical power supply companies during the year through merging, amalgamation, or the formation of trusts more or less in response to Official encouragement. Eleven plants were absorbed by larger interests in October alone. There was a decrease in the power generated during the year, however, attributed to the decrease in power consumption.

The Minister of Communication recently gave an exposition of his policy toward electrical enterprises in Japan, which was plainly meant to accelerate the combination of such enterprises. According to him, Japan's electrical industry stands out as one of the most prominent of all industrial lines in the country, it having absorbed capital to the amount of 1 600 million yen, while its capacity to supply power is up to 1 340 000 kW. It was beyond doubt that the combination of and systematisation of enterprises in the line was one of the prime conditions for its further development.

Having observed that his repeated utterances to urge their amalgamation had been well responded to, and that an increasing number of combination schemes were reported, he went on to remark that it was necessary to give greater impetus to this tendency among the electrical enterprises, while at the same time urging those engaged in the electrical industry to attain the prime object in view of those favouring combination by re-adjusting power transmission systems of management of plants, and thereby increasing their efficiency.

Electric Pumps in Marine Salvage.

Addressing the members of the BIRMINGHAM AND DISTRICT ELECTRIC CLUB on Saturday on the progress made during the war in the method of salvaging sunken vessels by means of electrical apparatus, Mr. V. H. Pearson gave as an example the transport "Admiral Cochrane," which was torpedoed by a German submarine off the South Coast of England. In this case the vessel had taken on a list of 33 deg., the whole of the after-decks being submerged. It would have been impossible to salve the ship by means of steam pumps owing to the degree of list. The electric pump could be lowered into the hold of the ship and could be kept running under water. The transport was lifted within seven days and placed on an even keel on the beach. After slight repairs in dry dock the vessel was put into commission again.

Resources of the Crown Colonies.

The Council of the BRITISH EMPIRE PRODUCERS' ORGANISATION have decided to appoint a Committee of representative producers from all the Crown Colonies and Dependencies to consider what steps should be taken: (a) To promote the development of natural resources and encourage the investment of British capital in the Crown Colonies; (b) To improve means of communication between the said Colonies and other parts of the Empire; (c) To re-adjust tariff arrangements so as to ensure that the products of such colonies in cases where import duties are imposed in Great Britain should be admitted on special terms, and that the tariffs of these colonies should be re-adjusted so as to give the largest preference possible to imports of goods produced in Great Britain.

In order to ensure effective representation on the Committee of the principal interests of the Crown Colonies some little time will be taken in selecting members.

Legal Intelligence.

Litigation Over Telephone Poles.

Last week the Railway and Canal Commission (Mr. Justice Lush, Mr. Tindal Atkinson, K.C., and Sir Lewis Coward, K.C.) heard an appeal by the Postmaster-General from a decision of Judge Crawford awarding an Essex landowner rental against him of from 5s. to 20s. each for poles on his property. The Postmaster-General said there were nearly a million poles on private property in this country, and, on the precedent of this decision, landowners had been sending in asking for 10s. for each pole, and the thing would create a revolution in the public service.

For the Postmaster-General, Mr. HAROLD MURPHY explained that the appellant (the Postmaster-General) sought a new trial of the case because of the fixation of rent of six telegraph poles on land of Mr. H. E. Brooks, of Stafford Lodge, near Grays, Essex. For three other poles Judge Crawford, at Romford, apparently said there should be no charge because, under a judgment of Mr. Justice Lush, those poles were upon a road. Counsel thought Mr. Brooks' main defence was that, having given up his right to the telephone owing to increased charges, he deemed himself entitled to exact a much heavier rental than the National Telephone Company, which paid 1s. a pole. The Postmaster-General contended that the rates he should pay should depend on the present damage, and there was no damage whatever to Mr. Brooks.

Mr. JUSTICE LUSH: So he is to be paid nothing? You are in occupation of his land. You cannot put up poles on somebody else's land and say, "You ought not to have any acknowledgment for the user."

Mr. MURPHY: I am given a statutory right to place poles on the land, and of coming to you if he fails to give consent. What you have to consider is whether such conditions as he seeks to impose are contrary to public interest. If there is no detriment or loss of amenity the imposition of any pecuniary payment would be contrary to public interest, and the imposition of a heavy rental would be ruinous to a public service.

Mr. JUSTICE LUSH: It would be contrary to public interest that you should pay him nothing. I dare say you would like to pay him nothing.

Counsel went on to explain that the judge's award worked out at 60s. for six poles. There were 818 000 poles on private property, and the average payment was 1s. 4d. Thirty per cent. were free; 95 per cent. were less than 1s. More was paid for telephone standards with stays on the top of buildings and in private gardens. The rent proposed would be a revolution of the whole system, and on its precedent landowners were coming in with demands of 10s. a pole.

For the appellant, Mr. CHARLES J. EVE said there were nine heads of damage under which he usually assessed damage, and in Mr. Brooks' case he could find no damage under any of them. The poles took nothing from the plough; they were in a wood; they hurt no grass, growing crops, fences, or hedges; there was no risk of telegraph men leaving gates open for cattle to stray; there were no gates; there was no game to be disturbed and no cover; no hedge to plash; no spoiling of commercial value, or any other damage, and as to unsightliness, there was no house near to see the poles. The only development value of the property was in minerals and forestry. If Mr. Brooks was going to build, quarry, or make an avenue he could give notice to have the poles removed.

Stating his own case, Mr. BROOKS contended that there was present damage, and that he should receive payment in respect of his interest in the land and its amenities. He was director of a cement company, and that chalk land would eventually be worked for cement. He had been in negotiation with his colleagues for the purchase of the property. When he gave the Postmaster-General notice to move the poles, three weeks passed and then he was presented with a polite bludgeon—told, in effect, "We will not get out and we are going to use our compulsory powers, and we give you notice accordingly." Such a threat of litigation did not attract a purchaser. He wanted to sell the estate as a whole, but if a purchaser shied at the telegraph poles 11 acres would be cut off from the property on the other side of the road, and he should be left with those 11 acres and £2 000 or £3 000 worse off than if he had sold it all. Nobody would buy the 11 acres for building. Ten shillings a pole was not adequate compensation for "putting this fear in the heart of a purchaser." If the Postmaster-General was presented with a notice to remove on account of quarrying he might be expected to be just as obstructive and litigious as now.

On the subject of the price paid for rents, Mr. J. SINNOT, engineer to the Post Office engineering department, put in returns of consents to the erection of poles.

In closing the enquiry, Mr. JUSTICE LUSH said the situation was an interesting one, and it was the first of its kind that the court had had since the Telegraph Construction Act of 1916. There was the question whether a capitalised sum should not be paid instead of rent. He understood Mr. Eve had mentioned a period of 16 or 20 years for capitalisation. The court desired to look into the matter, and, as that was the first case of its kind, judgment would be delivered next term.

Dawson v. Douglas.

This action, in which Sir Philip Dawson, M.P., sued Lord A. Douglas for libel, was mentioned to Mr. Justice Horridge on Monday, when it was announced that the parties had arrived at a settlement.

Mr. CROOM-JOHNSON (for the plaintiff) said that in August last Sir Philip Dawson was Conservative candidate for West Lewisham; the defendants were Lord Alfred Douglas, then editor of "Plain English," the directors of the North British Publishing Company, who published the newspaper, and Messrs. G. Holder & Sons, the printers. On Aug. 27 "Plain English" published an attack on Sir Philip, and the gravamen of the charges was that he was a naturalised alien and that in the course of his duties he advised people who consulted him, as an engineer, to employ persons who were not British subjects. Lord A. Douglas now assured him that at the time that the libel appeared he was away, and had no knowledge that the article was going to appear, and that he did not authorise or consent to it in any form, and this assurance the plaintiff had accepted. At the same time, Lord A. Douglas had recognised his responsibilities as editor and director, and in his defence he expressed regret that the article ever appeared. The other parties concerned apologised at once and paid a sum of money into court. It had been agreed that there should be judgment for Sir Philip Dawson for an agreed amount of damages and costs.

His Lordship.—The plaintiff's character has been absolutely vindicated, and judgment was entered on the agreed terms.

Parliamentary Intelligence.

Electricity (Supply) Acts.

The House of Commons has approved the following Special Orders made by the Electricity Commissioners and confirmed by the Minister of Transport in respect of the urban district of Amble in Northumberland; the parish of Distington, in the rural district of Whitehaven; the urban district of Ammanford; part of the borough of Wareham; the urban districts of Great Harwood and Rishton and the parishes of Wilpshire, Clayton-le-dale, and Ramsgreave, in the rural district of Blackburn.

Electricity (Supply) Bill.

The Committee stage of the Electricity (Supply) Bill was concluded in the House of Lords on the 5th inst.

VISCOUNT PEEL moved an amendment to Clause 10 (Power to continue way leaves) in order to reserve to railway companies the protection afforded to them under the Act of 1919. These were agreed to.

LORD MONK BRETTON moved a new clause to follow Clause 11, dealing with the power to make agreements as to working of generating stations, authorising the Electricity Commissioners by order to suspend for such period as they thought fit the powers of purchase of a joint electricity authority, or the London County Council, or any local authority in the case of any transfer or lease to a joint electricity authority of any part of an authorised undertaker's undertaking, provided that consent to such suspension had been previously obtained.

VISCOUNT PEEL accepted the amendment, and it was adopted.

Some other amendments were made, and the Bill was reported to the House.

Ayr Provisional Order.

The Ayr Burgh Provisional Order, which seeks power to extend the Corporation tramways and to carry out street improvements, &c., has been considered by a Parliamentary Commission (Lord Chalmers, chairman, Lord Meston, Sir Henry Craik, M.P., and Mr. J. A. Murray MacDonald, M.P.)

Mr. H. P. MACMILLAN, K.C., said the Order originally contained important provisions relating to the Loch Doon electrical scheme; but the Chairman of Ways and Means had directed that that portion of the Order should be dealt with by private Bill, as schemes for the supply of electricity for lighting and other purposes were not included in the topics with which the Commissioners might deal. The Order now consisted of nine portions, but the only portion which had aroused controversy was that dealing with tramway extensions and the widening of certain streets. It was proposed to acquire strips of garden ground in Carrick-road to enable that thoroughfare being widened to 46 ft., so as to permit the doubling of the tramway track. At present the traffic caused considerable congestion, and the doubling of the tramway track was dependent upon the widening of the street. By acquiring the land proposed is would be possible to have the statutory prescribed distance of 9 ft. 6 in. between the kerb and the nearest tram rail. The proprietors and occupiers were objecting to portions of their land being taken for widening the road. The maximum amount to be taken at any point was 7 ft. 8 in. The promoters had been advised that the tram rails in the thoroughfare must be relaid. It would be unfortunate if they had to relay the single rails again, and their opinion was that advantage should be taken of the opportunity to have the road put into a proper state. Several witnesses gave evidence in support of the Order, and ultimately the preamble was found proved.

Centre Poles for Princes-street.

Replying to Mr. W. GRAHAM, in the House of Commons on Monday, Mr. NEAL said that he had received the report of the Commissioners appointed to inquire into the tramway problem in Princes-street, Edinburgh, and he had decided to adopt the recommendation contained in it, namely, that the request of the Corporation for permission to put up centre poles to carry the overhead electrical equipment, and to alter the position of the rails on the northern side of the street, should be granted.

Electricity Supply.

HAWARDEN Rural Council have applied for a Special Order to extend the area for the supply of electricity under their 1914 Electric Lighting Order so as to include East Saltney, Higher Kinnerton, Hope, Llanfynydd, Sealand, and Tryddyn, and so much of the parish of Hawarden as is not included under the principal Order; to make new provisions as to maximum prices; and to authorise the Council to take a supply of electrical energy from the North Wales Power and Traction Company, or any other company, authority, or person. Any objections must be sent to the Electricity Commission by May 4.

The Mayor of Swansea on Thursday opened the new AMMAN VALLEY extension of the Corporation electricity department by switching on the current from the Manselton Sub-station. The new undertaking, which will provide power for the growing anthracite coal district of the Amman Valley and Gorseinon, will cost £45 000. Already the Gorseinon Electric Lighting Company, the Gellyceidrim, New Cwmgorse, and the North Amman (Cawdor) Collieries have contracted to take current to a guaranteed minimum of £11 000 a year, whilst an ultimate revenue of £25 000 is in sight. For a short distance the cables are underground, but overhead cables have been erected as far as Gellyceidrim Colliery in one direction and the Gorseinon Colliery in the other. When the system is extended right round the valley there will be a circular route covering about forty miles. The supply voltage is 33 000.

A petition, signed by a large and representative body of consumers of electricity for both power and lighting, has been forwarded to the Electricity Commissioners and the Town Clerks of Liverpool and Bootle, protesting against the proposed sale of the BOOTLE electricity undertaking to the Liverpool Corporation. The agreement has been signed by both corporations, and awaits confirmation by the Electricity Commissioners. The petitioners maintain amongst other things that the agreement leaves the future prices to be charged for electricity for private and public lighting and trade purposes in the absolute discretion of the Liverpool Corporation and does not provide for a cheap and abundant supply; and that if it is advisable for the two electricity undertakings to become a joint undertaking (which they submit is not necessary), then they should be worked on a partnership basis.

New Schemes and Mains Extensions.

MAIDENHEAD Town Council has applied for a loan of £5 300 for extensions to the generating plant.

An inquiry into the application of NAVAN Urban Council for a loan of £10 000 to carry out an electricity supply scheme is to be held by a Dail Eireann inspector in the Council Chamber on the 22nd inst.

KILMARNOCK Town Council have been granted a Provisional Order authorising them to supply electricity to places outside the borough, including the burghs of Ardrossan, Saltcoats, Kilwinning Stewarton, and Cumnock.

A scheme of extensions to GUILDFORD electricity undertaking, amounting to £20 000, has been drawn up by Mr. Spencer Hawes, consulting engineer, and approved by the Town Council. Application is to be made to the Electricity Commissioners for their approval and for sanction to borrow the money.

In connection with the loans of £40 000 and £12 473 sanctioned by the Electricity Commissioners, for plant and buildings in connection with STEPNEY electricity undertaking, the sums of £20 000 and £12 473 are to be taken up on loan from the trustees of the Union Savings Bank at £5 10s. per cent. per annum, repayable within twenty and thirty years respectively. The Council's scheme of extension at Limehouse generating station has been generally approved by the Commissioners, but they are of opinion that the extension should be limited to the installation of two 10 000 kW sets and boilers instead of three.

Alteration of Charges.

BOOTLE Electricity Committee have decided to reduce by 25 per cent. the additional charges made for electricity during the war. The reduction is to take effect from Jan. 1 last.

BURNLEY Electricity Committee have reduced the price of electricity supplied to the Tramways Department from 2·1d. to 2d. per unit. The charge will be again reviewed at the end of three months.

WATFORD Urban Council has reduced the price of electricity for power from 70 to 50 per cent. above the pre-war rate, and for lighting from 8d. to 6d. per unit, after the minimum number of units used during the summer and winter quarters.

The recommended revision of the charges for electric lighting and power in BELFAST have been approved by the Corporation. It is announced that the feared deficit of £38 000 on the last half-year's trading has been converted into a surplus of £16 000. This was chiefly effected by saving on coal charges and increased charges for current to consumers. The revised rate is as follows :—For lighting supply under maximum demand, first hour 8d. per unit as at present, but subsequent hours charge to be reduced from 7½d. to 5d. The general flat-rate charge is to be reduced from 8d. to 7d. per unit; for power, the charge is to be reduced from 6d. per unit for the first hour and 4d. afterwards to 5d. for the first hour and 2¼d. afterwards; for combined light and power, it is proposed to fix the charge at 2·4d. per unit, subject to a minimum consumption, the present price being 6d. for the first hour and 4d. thereafter.

Electric Traction.

LIVERPOOL Tramways Committee has received from the Ministry of Transport sanction to the borrowing of £132 200 for the reconstruction and doubling of the Liverpool and Prescot Light Railway.

A strong opposition is being offered to the RAILWAYS (NORTH-WESTERN AND MIDLAND GROUP) BILL, which enables the railway companies to run road vehicles, and its second reading in the House of Commons was only carried by five votes on Tuesday.

Ald. Higham, chairman of BLACKBURN Tramway Committee, stated last week that it was not proposed to revert to penny fares. Experiments in this direction elsewhere had ended in disaster, and if tried locally they would lead the department to bankruptcy.

By a majority of 13 votes, it was decided last week at a joint meeting of GLASGOW Tramways, Statute, Labour, and Lighting Committees to recommend that the electric standards in Great Western-road should be removed from the centre to the side of the roadway.

BLACKPOOL Tramways and Electricity Committee has decided to advertise for a successor to Mr. C. I. Baker, the chief traffic superintendent, who, as we announced in our issue of March 10, has been appointed general manager of the Ashton-under-Lyne Tramways. The Committee's report for February shows an increase of 117 440 units compared with last year. The Education Committee have made a grant towards the cost incurred by school children using the cars.

The Ministry of Transport has informed NEWPORT Corporation that the reasons given by the Corporation do not adequately justify their refusal to grant a licence to the South Wales Commercial Motors, Ltd., to run their Newport-Chepstow omnibus service to the centre of the borough. The Ministry consider the licence should be granted on conditions, one of which is that the terminal point of the company's service should be Clarence-place, Newport. The Tramways Committee have decided that their chairman should interview the Ministry of Transport on the subject.

Writing from PARIS last week, the correspondent of the "Daily Telegraph" states that reference to the death of M. Bulot, Procurer General, who was fatally injured by a vehicle when alighting from a tramcar, led to a discussion of TRAFFIC RULES at a meeting of the Municipal Council. The Prefect of Police said that all vehicles were required to proceed slowly past tramway halts, but he could not have police at every point to enforce the law. It is proposed to institute a system of signals to be applied by the tramway and omnibus companies, so that following traffic will be warned of impending halts.

The minutes of the Highways Committee, submitted to the LONDON COUNTY COUNCIL on Tuesday, referred to several tramway matters. It was agreed to apply the agreement of the 31st ult., between the Metropolitan Municipal Tramways Council, the E.T.U., and the Transport and General Workers' Union, as to rates of pay of electrical workers on tramways rolling stock work, to the employees concerned in the tramways department, including the light and power attendants in the permanent way branch. The revised rates will mean a saving of £4 950 a year. The following estimates were approved : £1 000 for the electric lighting of the central repair depot at Charlton, £1 500 for the provision of protective relays of a modern type on the tramways distribution system, and £1 985 for excess expenditure on the lay-by at Stamford Hill and junctions at Tooting Broadway and Stockwell.

Trade Inquiries.

A limited company established in TUNIS since 1901 desire to be put in touch with United Kingdom manufacturers of mechanical and electrical supplies, agricultural and industrial plant, building supplies, &c. Particulars can be obtained from the Department of Overseas Trade (Reference No. 395).

H.M. Trade Commissioner at WINNIPEG (Mr. L. B. Beale) has received an inquiry from Vancouver, British Columbia, for supplies of electric light meters. The annual consumption of electric meters used in Vancouver is stated to amount to about 5 000, delivery of which runs into about 400 per month all the year round. The type required is a bottom connected single-phase watt hour meter, the sizes ranging from 10 A to 800 A. The 10 A size is in greatest demand and now costs $8.75 laid down at Vancouver, all charges paid. The inquirers are anxious to receive in duplicate from United Kingdom manufacturers full particulars and lowest prices. Further particulars can be obtained from the Department of Overseas Trade.

A firm of mechanical and electrical engineers at MELBOURNE, with branches at Sydney and Adelaide, who represent United Kingdom manufacturers of electrical switchgear, are desirous of representing manufacturers of the following lines, viz. :—cables, and wires, lamps, a.c. and d.c. motors, insulating and jointing material, electrical porcelain, including insulators, consumption meters, dynamos and alternators, and general accessories. The firm are also desirous of acting as local agents for the presentation of tenders for Australian Government and Municipal contracts, being well accustomed to this class of service. A director of the firm is now in this country and will be pleased to discuss matters personally with firms who are interested. Application for names and addresses must be sent to the Department of Overseas Trade (Reference No. 379).

Personal and Appointments.

London County Council have appointed Mr. E. T. Bancroft motor school superintendent in the tramways department.

Mr. I. C. Brown, electrical engineer to the Oudh and Rohilkhand State Railway, has resigned his appointment.

Mr. H. Dickinson, Liverpool City electrical engineer, is to undertake the duties of city lighting engineer and official inspector of existing electric meters.

Our readers will join us in tendering to Mr. J. A. Robertson, borough electrical engineer of Salford, our sympathy on the death of his wife, which took place last week.

Mr. E. E. Hoadley, Maidstone, electrical engineer, has been re-elected one of the two representatives for the smaller towns of the country on the Council of the Electrical Development Association.

Mr. W. H. Wardle, principal assistant in the Liverpool Electric Lighting Department, has been recommended for an increase in his present salary from £300 per annum, plus E.P.E.A. bonus, to £350, plus Corporation bonus.

Mr. R. H. Pitts has been appointed to act as Staff Officer for the Underground Companies. He will hold this post in addition to his duties as Secretary to the Joint Standing Committee of the Companies.

The retirement in July is announced of Mr. H. J. Spooner, head of the Polytechnic School of Engineering, London, for the past forty years. A presentation is to be made to him, and old students desiring to contribute should communicate with Mr. F. R. S. Rice at the Polytechnic, Regent-street, London, W. 1.

Prof. J. A. Fleming has been compelled, on account of illness, to cancel all engagements for the present, and will consequently be unable to deliver the course of lectures on "Modern Improvements in Telephony" at University College, which has been announced to begin on April 26. It is hoped that Prof. Fleming will be able to deliver the course in October.

Business Items, &c.

The telephone number of the Sheffield Branch of English Electric and Siemens, Ltd. has been changed to Central 3 535.

As from the 1st inst. the address of Mr. L. B. Reale, H.M. Trade Commissioner at Winnipeg, is 703, Union Bank Building.

Owing to ill-health Sir Edward Capel Cure has resigned his appointment of commercial counsellor at Rome. His successor has not yet been announced.

Barimar, Ltd. are now granting licences to responsible engineering companies, founders, &c., to operate the Barimar Metallurgical (Patented) Process for recovering scrapped castings in their own shops.

C. A. Vandervell & Company have turned their magneto factory at Brighton into one for the production of small tools, the magnetos now being entirely manufactured at Acton, where all communications relating to these apparatus should be addressed.

Mr. Ralph M. Sitterley announces the establishment of his offices at 149, Broadway, New York, where he will act in the capacity of foreign sales manager of American manufacturers of electrical specialties, marine supplies, automotive products and equipment.

Institution Notes.

At the meeting of the Institution of Electrical Engineers on the 6th inst. the President announced that arrangements had been made for members to dine together at the Engineers' Club, Coventry Street, after the meeting on April 27, and he asked members who proposed to attend to send in their names beforehand.

Glasgow Electricity Department Engineering Society brought a successful session to a close on Monday evening, the 3rd inst., in the Lecture Room, 75, Waterloo-street, Glasgow, when a paper on "Heat Balance" was read by Mr. John Bruce. This paper won the prize offered at the beginning of the session by the management for the best essay on the subject named submitted by a member. The Society, which has a membership of 300, is serving a useful purpose in providing an opportunity for the discussion of those problems which confront engineers in the performance of their duties, and this cannot but be to the advantage of the members and of the department.

Obituary.

We regret to record the death of Dr. Andrew McWilliam, head metallurgical adviser to the Government of India from 1911-1920, and previously Professor of Metallurgy in Sheffield University.

The death took place at Sidmouth on the 7th inst. of Mr. J. J. Easton. Mr. Easton entered Siemens Brothers' offices at 3, Great George-street, Westminster, in 1868, at the age of nineteen, and remained with the firm and with the succeeding company—Siemens Brothers & Company, Ltd.—until June 30, 1919, when he retired. During this period of fifty-one years he was largely instrumental in furthering the growth of the company's business, and for many years had charge of its commercial organisation in relation to all classes of cables and telegraphy.

Telegraph and Wireless Notes.

A new telephone exchange to accommodate 400 subscribers was opened last week at Cambuslang (Lanarkshire). This is the third new exchange to be opened in the Glasgow district within a few months.

It is reported that negotiations between representatives of the Finnish and Swedish telephone administrations have resulted in a preliminary agreement, under which the two countries are to be connected by a cable between Helsingfors and Stockholm comprising nine lines.

Mr. A. W. M. Dyke, of Neath, delivered an address last week on "Elementary Principles of Telephony" at a joint meeting at the Wireless College, Cardiff, of the South Wales Wireless Society and the South Wales Section of the Permanent Way Institution of Engineers. Mr. W. M. Drysdale gave a wireless demonstration, and Mr. H. F. A. Sanderson, using his set, enabled the audience to hear signals from the large European commercial stations and music picked up from The Hague.

A dispute has arisen between the Association of Wireless and Cable Telegraphists, which has a membership of 5 000 to 6 000 (95 per cent. of the total of British wireless operators), and the London District Association of Engineering Employers, representing the shipowners and the wireless companies. The men's secretary states that, in addition to a reduction of wages, the telegraphists were to be called upon to perform "other duties" besides telegraphic work. They had attempted to get a definition and a conference, but only a vague reply was given which would leave them entirely at the mercy of the shipowners and the captains. The question of wages alone could no doubt be satisfactorily settled. The men had been instructed to refuse to sign on any ships, and already 300 to 400 men were "out."

Exhibition Notes.

It is proposed to hold an International Exhibition of Ideas, Inventions, and Discoveries at Amsterdam from June 24 to July 23.

In view of the interest at the present moment in the housing question, our readers will be interested in Stand 128, Row G, at the Building Trades Exhibition, where Vickers, Ltd., are exhibiting their portable concrete machinery, which includes brick machines, roofing tile machines, partition slab machines, and colour mills.

The first official commercial Fair to be held in Luxemburg will take place from Aug 14 to 22. The Fair is divided into thirty trade groups covering nearly every product except the heaviest metal goods Applications for space, forms for which are available at the Department of Overseas Trade, must be sent to the Organising Committee, by June 15.

A Bureau of Information will be maintained by the Trade Commissioner Service in Canada at the Annual Canadian National Exhibition which is to be held at Toronto from Aug. 26 to Sept. 9, and United Kingdom manufacturers are invited to send for free distribution catalogues of electrical machinery, appliances, and equipment, electrical railway equipment, chemical plant, scientific instruments, &c. Catalogues should be sent direct to H.M. Trade Commissioner, 24, West Adelaide-street, Toronto, not later than June 30. Firms who desire space at this year's exhibition should apply at once to the Secretary, Canadian National Exhibition, Lumsden Buildings, West Adelaide-street, Toronto.

Institution of Engineers, Australia.

At the Engineering Conference arranged by the Institution of Engineers, Australia, and held early in February, Prof. R. W. Chapman, one of the organisers of the Institution, was installed as its president for the current year. The annual report sets out the numbers of members in the principal towns in the Commonwealth, the total of all grades being 2 020. Mr. W. J. Newbigin, the retiring president, said, in the course of his presidential address, on the inauguration of the Federal Engineering Council, they might look forward within a short period, to having from four to five thousand trained engineers banded together for the technical and scientific development of their country. It was necessary to induce the younger men to join the Institution, and he suggested that employers should give a preference to members of the Institution. He contrasted the methods of engineers and politicians, saying that the former worked upon a basis of reason and calculation, while the latter depended for their success upon an appeal to the emotions. Engineers could do something towards improving Government Departments. Engineers had enabled Australia to reach her present position, and her future would also depend upon them. During the Conference the Lord Mayor received the members at the Melbourne Town Hall, and in the course of the meetings Sir John Monash (chief of the Victorian Electricity Commissioners) delivered a lecture on "The Victorian State Electricity Scheme." Mr. H. N. May read a paper on 'The Jolimont Workshops and Sub-Station "—a part of the Melbourne and Metropolitan Railway electrification scheme—and Mr. R. Lawson a paper on "The Collingwood (Melbourne) Automatic Telephone Exchange.'

The French Minister of Public Works is introducing into the Chamber a Bill authorising the construction, at l'Aber Vrach (Finistère Department) of a tidal power station.

Imperial Notes.

Work has been commenced on the carrying out of the St. George's (N.S.W.) County Council's electricity supply scheme for Bexley.

Electrical imports into South Africa last year amounted to approximately £2 000 800, compared with £1 680 000 in 1920 and £1 040 000 in 1913.

"The British and South African Export Gazette" states that there is a considerable demand in Dar-es-Salaam, Tanga, and other towns for electric lighting and heating apparatus.

The Customs Duty on electric light bulbs imported into British Honduras in now 5 per cent. *ad val* under the British Preferential Tariff, and 10 per cent. *ad val* under the General Tariff.

The Reid-Newfoundland Railway Company has withdrawn its proposition for extensive water-power development and the establishment of paper-making and other industries along the Humber river, on the West Coast of Newfoundland. The proposition called for Government guarantee of certain securities.

Bathurst (N.S.W.) Council have engaged Mr. R. J. Franki to report on the desirability and the best means of providing electricity supply for the town. The Council have approached the Kendos Cement Company with regard to a supply by the company, but this would necessitate transmission over about 50 miles.

During the nine months ended Dec. 31 last the total imports into India of electrical apparatus advanced from 2·43 to 3·35 crores. British shipments advanced from 1·81 to 2·32 crores, American from 0·39 to 0·71, and Italian from 0·04 to 0·14 crores. There was a falling off in imports from Japan.

The South Gippsland Creamery and Butter Factory Company's electric supply powers for Yarram (Victoria), have been transferred to the Yarram Hydro-Electric Company. A condition of the transfer is that the Hydro-Electric Company will bear the cost of substituting a.c. for d.c. motors on consumers' premises.

Tenterfield (N.S.W.) Council's electricity undertaking has not been paying its way. Mr. Corin, chief electrical engineer of the Public Works Department, has been consulted on the question of a hydro-electric supply for the district, and calculates that this could be provided by means of power from either Tenterfield Creek or Boonoo-Boonoo for an expenditure of from £30 000 to £35 000.

The chairman of the Electrolytic Zinc Company of Australia (Mr. W. L. Baillieu) states that the daily average output of zinc is 68 tons, and a production of 80 tons would be reached within the next two or three months by making arrangements with the Hydro-Electric Department for a further supply of power over and above the 15 000 h.p. now available. It is anticipated that the full 30 000 h.p. will be available in August or September next, by which time the Risdon plant would be completed and the production will be 120 tons daily.

Montreal Chamber of Commerce has ranged itself among the opponents of the St. Lawrence canalisation scheme. It is said that dual control of the scheme would probably lead to friction between the United States and Canada. The estimated cost ($252 728 2[illegible] exclusive of interest during construction and cost of improvements to ports on the Great Lakes) is so high that leading business houses are doubtful of the financial position. The standing charges on the Lake Ontario-Montreal section alone will amount to over $20 000 000 annually. More than 60 per cent. of the water-power available is on the Canadian side of the river, but all the proposed locks, dams, and other water-controlling devices will be placed on the American side.

Foreign Notes.

It is announced that the Siemens-Schuckert Werke, of Berlin, have made an arrangement with the Furukawa Mining Company under which the Siemens Company will construct a large factory in Tokyo for the manufacture of electrical machinery. Twenty German engineers, accompanied by technical experts, have left for Japan.

According to the "Journée Industrielle," Prof. Otto, of the Sorbonne, has invented a process for seasoning timber by the use of ozone. The process is said to give the same result in about 20 days as would naturally be obtained in the course of several years. The wood is subjected to the action of a current of air containing a certain percentage of ozone. Samples of oak and walnut, which have been treated by the process, are said to show the same characteristics as seasoned wood. The treatment does not change the colour of the wood. The Otto process is being worked by a French Company at Serengo, near Milan, but new works will shortly be built in the neighbourhood of Paris.

A correspondent of the "Times Trade Supplement" states that the representative of a British engineering firm, after making a tour of inspection of Mauritius sugar estates, has reported that a great saving would be effected if the owners of the factories made use of electricity generated by water power, instead of steam raised by coal, wood, or cane refuse for operating their machinery. He contends that "thousands of horse-power of electricity are going to waste and that this ought to be developed to electrify the Government railways and also to operate all the sugar mills from a central power station." The scheme drawn up by Mr. G. McAlpine, when he was Official Electrical Adviser, for the electrification of the local railways using the waterfalls at Tamarin as motive power, has recently been revived and is now engaging the serious attention of the authorities.

Miscellaneous.

The late Mr. H. S. J. Booth, managing director of the Electrophone, Ltd., has left estate valued at £6 929 (net personalty £6 030).

Mr. G. Washington Talbot, of Anerley-road, Penge, Postmaster-General and Director of Telegraphs, Burma, has left estate valued at £2 732.

In view of the need for economy in public expenditure it has been decided to suspend the post of commercial secretary (Grade II.) for Chile. The post will be closed on May 1.

The offer of a company to pay £5 per sign per annum for illuminated electric signs affixed to tramway and gas standards has been approved in general principle by the Swansea highway authorities.

Speaking at the annual dinner of the Institution of Mining and Metallurgy last week, Mr. W. C. Bridgeman stated that, in spite of the recommendations of the Geddes Committee, it had been decided not to abolish the Department of Mines.

Birmingham University has received from the Trustees of the James Watt Memorial Fund the sum of £5 000 towards the establishment of a Chair of Research in Mechanical Science, to be known as "The James Watt Chair."

The revenue from advertising on the Cardiff Corporation tramcars for the past year amounted to £3 161, an increase of over £1 000 on the receipts for 1920. The tramways manager has been authorised to rearrange the spaces let for advertising with a view to bringing in a still larger revenue.

The Select Committee of the House of Lords' Offices report, with reference to the suggestions in the third report of the Geddes Committee that the fees for private Bills should be increased by 50 per cent., that it is inexpedient to make any further increase in the ordinary fees for private bills.

A fatal accident occurred at the Worcester Electricity Works on the 8th inst., W. J. T. Whitehouse (26), a fitter's mate, being caught by a sprocket wheel on some shafting while tightening a "grub screw" in a "collar" on a rod which worked the grates. A verdict of accidental death was returned at the inquest.

Sir William Mackenzie, K.C., sat as an arbitrator appointed by the Minister of Labour at Cardiff, on the 4th inst., to investigate a claim by the employers' side of the South Wales & Monmouthshire Joint Industrial Council for the electricity supply industry for a reduction in wages of the skilled and semi-skilled men by 6s. a week and the unskilled men by 4s. Mr. Moxon, chairman of the Newport Corporation Electricity Committee, conducted the case on behalf of the employers, and Mr. J. L. Davis and Mr. F. Quick represented the interests of the employees. Sir William Mackenzie reserved his decision.

The Fuel Problem in Germany.

Owing to the internal industrial situation, it is interesting to see how Germany's power requirements are being increasingly met by the use of water and lignite. In 1913 about 75 per cent. of the whole of the electricity supply was produced by ordinary coal, water-power and brown coal (lignite) accounting for about 15 per cent. of the balance. It is now stated that only about 50 per cent. of black coal is used, the proportion of lignite having increased to nearly 35 per cent. The annual production of lignite in Germany was 111 635 000 tons in 1920, that of black coal being 131 428 000 tons. In eight or ten years it is calculated that, by an extension of existing hydro-electric stations, together with new water-power projects, it will be possible to generate 50 per cent of the whole of the power required for industrial and private uses and for traction by means of water-power alone. In Bavaria and the South German States hydro-electric developments will enable the use of ordinary coal for industrial work to be almost entirely dispensed with, and make possible the electrification of the whole of the railways of South Germany.

Forty Years Ago.

"The Electrician," April 15, 1882.

A Long Telephone Line.—News from America says that telephonic communication has been effected between Alpena and Bay City on the telegraph wire between those places. The line worked well, though the distance between the two cities is 130 miles.

American Patents.—An American contemporary says: "Taking the subject of electrical patents as a whole, the most activity has been exercised with the following during the past three years: 1, electric lights; 2, dynamo machines; 3, telephones and their appliances. Prior to Jan. 1, 1878, there were only twenty patents on electric lights; July 1, 1881, there were 192. Prior to July 1, 1879, there were only nineteen dynamo and magneto machine patents; July 1, 1881, shows 111."

Quick Work.—On Thursday last a letter was received by Messrs. Crompton & Company, electric light engineers, asking them to light Woolpit Church, in Norfolk, for Easter Sunday. The firm wrote on Thursday evening to their Norwich engineer, Mr. S. Baynes, giving the necessary instructions. He succeeded in taking over, installing, and getting to work a set of tackle, and the church was successfully lighted for the evening service on Easter Sunday. As Friday and Saturday were the only two working days, and as traffic was greatly impeded on those days by the holiday makers, this is smart work.

Companies' Meetings, Reports, &c.

Brush Electrical Engineering.

The thirty-third general meeting of the Brush Electrical Engineering Company, Ltd., was held on Monday at 88, Kingsway, London, W.C., Mr. E. Garcke presiding.

The secretary (Mr. F. M. Hodson) having read the notice convening the meeting,

The Chairman said that the directors were glad to be able to report a further substantial improvement in the general prosperity of the company. Including the amount brought forward from the previous year, they had a total profit balance of £374 585 to deal with. It was proposed to apply to depreciation of buildings, plant, patents, &c., £15 000, to pay a further 4 per cent. interest on the prior lien participating debenture stock, to add to the reserve fund £73 190, bringing it up to £150 000, and to pay a dividend on the ordinary shares of 15 per cent. for the year. The amount to be carried forward—namely, £214 074—was subject to the settlement of the excess profits duty for 1920 and previous years' income and corporation profits tax. The cash position was a strong one, and since the close of the year their liquid cash resources had been still further increased. Last year he mentioned that the directors thought it advisable, owing to change of values, to have a valuation made of the capital assets of the company, and he was glad to say that the valuation showed a considerable appreciation—nearly double the amount of the book figure.

Record Output in 1921.

They were fortunate in entering 1921 with a good order book, so that the trade depression which prevailed so generally during the year did not affect their activities in the same degree as those of many engineering undertakings. All departments of the works were fully employed, and although the deplorable coalminers' strike in the spring and summer of the year was a disturbing factor, they were able to carry on without serious dislocation, with the result that the output for the year was the largest in the history of the company. They were concentrating on specialities which, to some extent, placed them outside the rigours of extreme competition, and the greater the need for fuel economy in industrial enterprises, the greater was the inducement of users of electrical plant to install the company's Ljungstrom turbine. There was no doubt that last year some orders were lost, not because of the depression in trade, but because they were unable to quote sufficiently early dates for delivery. With the increased manufacturing facilities they had now provided this difficulty would be remedied to a large extent in the future.

At present they had a very substantial amount of work on hand, and with the anticipated revival of business they were justified in looking to the future with confidence, provided that the labour unions recognised the altered circumstances of to-day and settled down to production under conditions which permitted of successful competition for work both at home and abroad. If the members of the Amalgamated Engineering Union did not return to work soon it would become a question with many firms either of shutting down completely or endeavouring to replace the skilled men by training others to do their work.

Progress of the Brush Ljungstrom Turbine.

On previous occasions he had referred to the development of the company's Brush Ljungstrom turbo-generator plant, and had drawn attention to the change which the installation of this plant had brought about in the fortunes of certain electricity supply undertakings. The merits of the design were now generally recognised, and evidence of the economies which it effected in steam consumption continued to accumulate. Taking, for instance, the Loughborough Corporation Electricity Supply undertaking, which was equipped throughout with turbine plant of the company's manufacture, although some of it antedated the introduction of the Brush Ljungstrom type, this station, which had an output of 3 736 296 units sold in 1921, occupied the third most favourable place for low working costs in a group of 114 electric supply undertakings in Great Britain, having an output of between 3 000 000 and 15 000 000 units, and was first among such stations in the Leicestershire area. Of course, the bigger the output, the larger margin there was for saving on generation costs. An examination of the published lists of electricity supply undertakings disclosed many similar cases. With the advantages he had mentioned, he thought they might look forward with confidence to the further development of this section of their business.

The company's output in transformers was also a record for the year, and the product of this department appeared to have given general satisfaction to buyers, both as regarded efficiency and reliability. On the rolling stock side the output was well maintained. They were well equipped for securing their fair share of any business offering, not only for tramcars and trucks and motor-'bus bodies, but also for railway rolling stock.

The report and accounts were unanimously adopted, and the Chairman announced that the dividend warrants would be posted that evening.

A full abstract of the report and accounts appeared in our last issue.

Edison Swan Electric.

The thirty-eighth ordinary general meeting of this company was held on Tuesday, Mr. C. Jermyn Ford (chairman and managing director), presiding.

The Chairman, in the course of his speech, said: "The period covered by the accounts has been the most disastrous for industry which this country, and the commercial world has ever known. The strike of the moulders, and the coal strike, caused losses of millions of pounds. These strikes were followed by the strike of the shipwrights, which in turn was followed by that of the ship joiners, which continued for nearly twelve months, until August last. The loss shown by the accounts is largely attributable to the unprecedented fall in values of all raw materials and manufactured goods, and to stagnation in trade. The fall in values of all raw materials and manufactured goods varies from 20 per cent. to 75 per cent. We have made the most careful and minute valuation of our stocks, and the figure at which they appear in the balance sheet (£618 000), represents bedrock prices; the depreciation amounts to £346 000, and is responsible for the greater part of the loss shown.

"Our sales department and our depots throughout the Kingdom have lost no possible opportunities to stimulate sales, and I am satisfied that we have had our full share of such trade as was available. The board have explored every avenue in the company's organisation, and savings have been made, aggregating between £50 000 and £70 000 per annum, but the accounts before you have only benefited by these to a very small extent. This company in common with other manufacturers of electric lamps reduced the price of lamps by 15 per cent., and this involved allowances to traders, which cost the company £26 000 in hard cash. One of our subsidiary companies recently tendered to an Indian Railway Company for goods to the amount of £6 000, and this was absolutely rock bottom price. What happened?—the Germans took the contract at £2 500. This figure would not pay even for the labour on the job in this country, and we are meeting with this class of competition everywhere.

"We are now faced with the lock-out of the Engineers, and have had no option but to lock out certain employees.

"We have, during the last few months, introduced two new types of lamp, one is the "Fullolite," an opal lamp, designed to obviate the glare, and this has caught on beyond our most sanguine expectations. The other is a daylight lamp, constructed of special tinted glass, which gives a daylight effect. Considering the slack times we are moving in our lamp sales have been good, and this branch of the business should largely develop.

"It has been suggested in certain quarters that far too heavy stocks have been held. When these stocks were originally acquired, trade was extraordinarily active, and prices were booming, and the stocks did not appear to be excessive. In numerous cases, by the time we had obtained delivery of materials and manufactured the goods the slump had arrived, and orders were cancelled by customers, and this all helped to increase our stocks. The balance standing to debit of profit and loss is £344 720, and the board recommend that £55 000 now standing to reserve, be transferred to profit and loss account, thus reducing the debit balance to £289 720. The board have been asked how they propose to treat this debit balance, and whether they intend to bring forward a reconstruction scheme, embracing a reduction of capital, in order to wipe it out. They have obtained the views of some of the largest shareholders, and it has been agreed that no good purpose would be served by bringing forward any scheme at this juncture. Mr. A. F. Berry, chairman and managing director of the The British Electric Transformer Company, has consented to join the directorate. It is also suggested that a further addition be made, but a final decision has not yet been come to with regard to the gentleman who will go on the board. Mr. Ellice-Clark and Mr. Quilter have signified their willingness to retire from the directorate. I shall part with these two colleagues with the deepest regret, as their sound judgment and knowledge of the business have been of incalculable assistance. The company has, I am convinced, a marvellous reserve of recuperative strength, centered mainly in its widespread sales organisation, represented by its twenty-six important depots in the United Kingdom and Australia, and I am convinced that with a moderate revival in trade, we ought to do fairly well."

He concluded by moving the adoption of the report and accounts, and the motion was seconded by Mr. E. C. Quilter and carried unanimously.

A number of questions were asked, and in reply the chairman said the action against the Philips company was subjudice and could not be discussed.

Metropolitan-Vickers Electrical.

In the course of his speech at the annual meeting of Metropolitan-Vickers Electrical Company last week, the chairman (Mr. J. Annan Bryce), who presided, said that the output of the year had been the largest during the history of the company, exceeding by 35 per cent. the output of 1916. This high degree of efficiency was obtained in spite of a decrease in the number of workmen and of delay caused by the coal strike, to meet which some of the boiler furnaces were converted to oil firing. The average rate of wages showed a slight decrease from that of 1920, but was still about double the pre-war rate. The benevolent fund had now been running for twelve months, and the number of members had increased considerably. It had proved of great benefit in relieving many necessitous cases which could not have been assisted in other ways. There had lately been formulated a provident fund scheme for the benefit of all the employees of

the company. The number of accidents showed a steady decrease. They were now less than half as numerous as in the year 1916. This happy result had been accompanied by a corresponding reduction in cost to 3s. 7d. per cent. of the wages paid—by far the lowest figure ever reached.

The activities of the Research and Education Department continued unabated. The new research buildings had been fully staffed and equipped during the year. It was believed that they probably comprised the best-designed and equipped laboratories for industrial research in the kingdom. A special feature of the Research Department was the Intelligence Branch. It aimed at providing information drawn from world-wide sources about all matters concerned with the company's technical and commercial interests. It possessed a library which all the employees were encouraged to use. Improvements were constantly being made in the methods of training the works apprentices, who numbered over 1 000. The works foremen had shown their interest by presenting a valuable trophy for competition among the apprentices, and the first award had recently been made. The courses of instruction for University and Public School students were maintained, and a comprehensive scheme of evening classes had been conducted during the winter to prepare the junior female staff for more responsible work. Special facilities were now provided for the instruction of adult workers to fit them for promotion, and special study was made, particularly in the case of the younger people, as to the possibilities of selection for particular vocations.

Folkestone Electricity Supply.

The accounts of the Folkestone Electricity Supply Company for the year ending December 31 last, including the receipts from hired installations, show a profit for the three undertakings amounting to £17 681, an increase of £2 767 over last year's gross profit. This amount, with the sum of £632 brought forward and interest on investments, &c., and after allowing for interest on debenture stock and bank overdraft, and dividend on preference shares, shows a balance of £12 317. Out of this the directors have carried £7 561 to the depreciation fund, bringing it up to £69 324, and £1 525 to the reserve fund, bringing it up to £12 600, and they recommend the payment of a dividend at the rate of 4¾ per cent. (less income tax) on the ordinary shares for the year, which will require £2 375, leaving a balance of £855, which it is proposed to carry forward. The payment of the dividend recommended is subject to the consent of the Electricity Commissioners. Application has been made to the Commissioners for extended powers in the district by incorporating the urban district of Cheriton and the parishes of Saltwood, Newington and Hawkinge in the company's area of supply, but the formal Order has not yet been obtained. Since the last annual meeting the board have approved a scheme entailing substantial extensions to plant, and orders have been placed for additional machinery. Some portion of this has already been installed and the remainder is due for delivery during the next few weeks, and will, it is hoped, be running in time for the season load. Up to Dec. 31, 1921, the equivalent of 212 180 eight-candle power lamps was being supplied, being an increase of the equivalent of 13 372 eight-candle power lamps over those connected at Dec. 31, 1920.

Urban Electric Supply.

Presiding at the annual meeting of the Urban Electric Supply Company on March 28, Mr. P. D. Tuckett (chairman of the company) said that most of the undertakings showed very satisfactorily increased earnings, and but for the set-back experienced by the Cornwall Power Company and by Hawick, the increase would have been some £12 000 larger. Last year's output fell by nearly 1 000 000 units, a drop of over 40 per cent. While it was a satisfaction to them that they were able to recommend the resumption of a dividend payment, they deplored the necessity of adding still further to the arrears of cumulative dividend. After payment of this half-year's dividend there would be four years' preference dividend (a total of £50 000) in arrear. He calculated that their inability to conduct the business on a commercial basis had deprived them of something not far short of £150 000. Now, however, with the higher rates which they had at last been conceded, and with falling costs, they would be disappointed if they could not resume payment of the full preference dividend a year hence; but, in face of their limited cash resources, and the necessity of conserving them till their position was still further strengthened, they were unanimous in feeling that they could not prudently recommend a larger distribution on this occasion.

London Electric Wire Co. & Smith's.

Presiding last week at the annual meeting of the London Electric Wire Company & Smith's, Ltd., Sir G. H. Fisher (chairman) said that, although the profit for the year showed a slight decrease, the balance available for distribution, after the interim and final dividends on the preference shares and an interim dividend of 1¼ per cent. on the ordinary shares had been paid, was higher by £5 619. It was proposed that a final dividend be paid on the ordinary shares of 6¼ per cent., less tax, making a total of 7½ per cent., less tax, for the year, and leaving £44 546 to be carried forward into 1922. There had been a considerable falling off in customers' orders, and the good showing was to a great extent due to customers' orders carried forward from 1920 into 1921. It was not easy to forecast the future, but it was hoped that the Government would insist upon rigid economy and reduce taxation, and all must endeavour to remove the existing industrial unrest. He had no hesitation in saying that, with a revival of trade, the electrical industry would be one of the first to reap the advantage, so that their company had good reason for hope in the future.

The Montana Power Company has declared a quarterly dividend of 3¼ per cent.

Listowel Electric Light and Power Company recommend a dividend of 10 per cent., tax free.

The net income of the Consolidated Gas, Electric Light, & Power Company for the past year amounted to $3 064 045.

The Central Argentine Railway has declared an interim dividend on the consolidated ordinary stock of 2 per cent., less tax.

The directors of the Madras Electric Tramways (1904) Company recommend a final dividend to holders of preference share warrants to bearer at the rate of 6 per cent. per annum, less tax.

The total earnings for 1921 of the New York Telephone Company amounted to $21 393 035, less $8 148 492 for interest charges, leaving a net profit of $13 244 543. Dividends amounting to 8 per cent. have been paid, leaving $403 296 carried forward.

The Anglo-American Telegraph Company announces a dividend for the quarter ended March 31, 1922, of 15s. per cent. on the ordinary stock and £1 10s. per cent. on the preferred stock, less tax, payable May 1, to holders registered March 31, 1922.

An extraordinary general meeting of the Rangoon Electric Tramway and Supply Company will be held in Rangoon on April 20 to pass resolutions to increase the capital of the company to £800 000 by the creation of 300 000 new shares of £1 each, and to make various alterations in the articles of association.

An offer of £110 000, it is stated, has been received by the North Melbourne Electric Tramways & Lighting Company from the State Electricity Commission of Victoria for the undertaking, and in addition certain stores are to be taken at a valuation not to exceed £4 000. Payment will be made of £25 000 in cash, and the remainder in Victoria Government 6 per cent. debentures, having a currency of twelve to thirteen years, at par. As the price offered is insufficient to pay the debenture holders in full, there will be nothing left for shareholders.

The Railway Commissioners for New South Wales have issued their report on the working of the Government railways and tramways for the quarter ended Dec. 31, 1921. There was an increase of two and a half miles open on the tramways. Revenue amounted to £920 715, an increase of £40 683, while expenditure rose £66 014 to £795 258. The number of tram miles run were 7 482 043, an increase of 202 687 miles. Earnings per tram each mile rose ½d. to 2s. 5½d., but expenditure increased 1½d. to 2s. 1½d. The percentage of expenditure to earnings was 3·50 higher at 86·37. A decrease of 1 217 161 occurred in the number of passengers carried.

The report of the Chiswick Electricity Supply Corporation for 1921 states capital expenditure on works at Chiswick and Aberystwith was £3 893. Revenue for the year was £43 722, against £41 987. After paying sinking fund premium and trustees' fees the profits were £17 373, compared with £15 770. After deducting interest on first mortgage debenture stock the balance to the credit of net revenue was £14 029, making with the balance brought in £16 064. The directors recommend a dividend of 8 per cent. The sum of £8 000 had been placed to depreciation reserve, leaving £3 040 to be carried forward.

The net profit of the British L. H. Ericsson Manufacturing Company for 1921, after writing down stocks to present-day values and charging £22 107 for annual depreciation of buildings, plant, &c., £9 977 for income-tax, £9 122 for interest on debentures and loans, and £600 for debenture issue expenses (balance), was £68 997, making, with £43 897 brought in, £112 894. The directors recommend the payment of 10 per cent. (free of tax) on the ordinary shares; to reserve account, £30 000; to special reserve, to meet future contingencies, £15 000; carrying forward £51 893 (subject to Corporation Tax). Loans in last year's balance-sheet, totalling £109 727, have been paid off.

The Eastern Telegraph Company, and The Eastern Extension, Australasia & China Telegraph Company, Ltd., announce that, owing to unavoidable delays in obtaining the necessary returns from foreign stations and administrations, it will be impossible to issue the audited accounts and balance-sheet for the year ended Dec. 31, 1921, in time to allow of the annual general meeting being held next month, but the directors will convene the meeting as soon as the full accounts can be submitted. The directors have, however, decided to pay on May 15 next a final dividend for the year 1921 of 2½ per cent., free of income tax on the ordinary stock. This will make the distribution for the year 10 per cent., free of income tax, the same rate as was paid for the previous year.

The report for 1921 of the Canadian General Electric Company shows a net profit of $706 092. Undivided profits at December 31, 1920, were $778 672. Deducting dividends paid—7 per cent. on the preferred and 8 per cent. on the common stock—there is a balance at the credit of the profit and loss account at the end of December last of $557 726. The sum of $3 800 000 (portion of appraised depreciated values of plants reported by the Canadian Appraisal Company in excess of book values) was added to reserve. Deducting $1 800 000 for stock dividend of 20 per cent. to common share-

holders, the reserve account at the end of December stood at $7 000 000, making, with the balance of the profit and loss, a surplus of $7 557 726.

The gross revenue for 1921 of the Windermere & District Electricity Supply Company amounted to £8 382, an increase of £1 725. Working expenses amounted to £5 677, an increase of £818. Keswick Electric Light Company has again paid 5 per cent. on account of arrears of interest on its debentures, and this company's net revenue account has been credited with £334 on its holding. The balance of the revenue account, including the interest on Keswick debentures and the balance brought forward from last year, amounted to £3 364. Debenture interest and bankers' charges amounting to £1 083 have been paid, free wiring rents written off capital account (£90), depreciation reserve account (£1 000), leaving £1 191. The bank overdraft was reduced at the end of 1921 to comparatively small dimensions, and the directors recommend that a dividend of 3 per cent. be paid on the preference shares, amounting to £750, and that the balance of £441 be carried forward.

The report of the Argentine Tramways and Power Company for the year to September 30, 1921, states that the gross receipts of the tramway department were $690 657 paper, an increase of $128 271 paper. The gross receipts of the light and power department were $336 314 paper, an increase of $66 447 paper. The net receipts from operation totalled £28 028, an increase of £5 442. The profit on exchange was £255. Including interest and transfer fees, revenue was £28 559, against £26 893. After charging interest and sinking fund on debenture stock and London expenses, and transferring £5 000 to reserve for renewals, there remains £10 245. A scheme of arrangement approved by holders of preference and ordinary shares on March 22 provides, *inter alia*, that £18 323 standing to the credit of the revenue account at September 30, 1920, shall be carried to reserve and shall not be treated as profit available for dividend. Subject to the scheme being approved by Court and to £50 000 of the Five per Cent. Debenture stock, subscriptions for which have been conditionally promised, being allotted, the directors propose a dividend at rate of 5 per cent. (less tax) on the preference shares in respect of the past year, carrying forward balance, subject to income-tax and corporation tax (if any).

Tenders Invited and Accepted.

UNITED KINGDOM.

Glasgow Corporation. April 17.—Electric wiring and fitting of Blackfriars Parish Church, Dennistoun. Specifications, &c., can be obtained at the Office of Public Works, 64, Cochrane-street, Glasgow.

Glasgow Electricity Department. May 1.—Supply of (1) cables (including small IR cables and flexibles); (2) meters; (3) carbons, for a period of twelve months. Particulars from R. B. Mitchell, Engineer, 75, Waterloo-street, Glasgow.

ASIA.

Department of Posts and Telegraphs, Bangkok. June 5.—Telegraph and telephone materials to the value of £10 000. Tender forms can be obtained from the Chief Electrical Engineer, Telephone Exchange, Bangkok.

Liverpool Corporation have accepted the tender of the English Electric Company for 100 40-h.p. D.K. motors, including roller bearings.

Ferranti Ltd. have lately been entrusted by the Public Works' Department of the New Zealand Government, with a contract for the supply of seven 4 000 kVA, 110 000 V single-phase, oil immersed, forced-cooled transformers, in connection with the Mangaho Hydro Electric Power Scheme.

Stepney Borough Council have accepted the following tenders :—The Enfield Ediswan Cable Works, Ltd., at £20 917 13s. 4d., for the supply of cable during period ending March 31, 1923; Cambridge & Paul Instrument Company, for an indicating outfit for measuring the discharge of carbon dioxide from one of the boilers at Limehouse station, at £52 13s.

Benalla (Victoria) Council have accepted tenders amounting to £13 056 for plant and material for their electric supply undertaking. The bulk of the orders have been given to Australian firms. Wm. Adams & Company have the contract for power plants, £6 409; A. H. Frost & T. Dolan, poles, £800; Holmwood & O'Neill, bare copper cables, £1 200; and Thomas Bros., meters, £1 250.

Maidenhead Town Council have accepted the following tenders :—Ruston & Hornsby, four-cylinder oil-engine set of 250 kW capacity, for the electricity works, at cost of from £5 224 to £5 239 according to the make of dynamo finally selected; Drake & Gorham Wholesale, Ltd., "Xcel" electric irons, for hiring out, at 14s. 4d. each; Ferranti, Ltd., for transformers.

Wolverhampton Electricity Committee have accepted the tender of the Stirling Boiler Company for two 40 000 lb. water-tube boilers with superheaters, complete with the necessary accoutrements, to be erected ready for the raising of steam, at over £8 000, and a further tender of the Underfeed Stoker Company for four self-contained draught travelling grate stokers and four cast-iron hoppers for the sum of £5 122.

The Government of New Zealand has accepted the tender of the Metropolitan-Vickers Electrical Company, amounting to £30 764, for the supply of switchgear for the Mangahao hydro-electric installation, which will provide the Wellington district and city with electricity. The installation will have the highest electrical pressure in Australasia, and the best and most reliable controls were necessary. The lowest tender received was one for £24 666 from America.

New Companies.

Anti-Vibration Electric Lamp.

Anti-Vibration Electric Lamp Company, Ltd. (180 973). Private company. Reg. April 6. Capital, £500 in £1 shares. Manufacturers, exporters, and importers of and dealers in electric goods and accessories, etc. Subscribers : W. Lennard and R. C. Radeglia. Solicitors : H. Crafter & Company, 7, Southampton-street, W.C. 1.

British Horo-Electric.

British Horo-Electric, Ltd. (180 855). Private company. Registered April 3. Capital £50 000. in £1 shares. To adopt agreements (1) with H. Binggueley and F. G. Trollope and (2) with the Compagnie Generale Horo-Electriques; to develop and turn to account the inventions, patents and rights comprised in the first agreement and to carry on the business of manufacturers of, and dealers, in electrical and other watches, &c. First directors : F. G. Trollope, L. W. N. Hickley, M. P. Favre-Bulle, H. Binggueley, and Lieut-Col. H. W. Snow. Secretary : V. G. Frohman, 34, Waldgrave Road, Ealing, W. 5. Solicitors : Clowes, Hickley and Heaver, 10, King's Bench Walk, Temple, E.C.

Burndept, Ltd.

Burndept, Ltd. (180 745). Private company. Registered March 30. Capital, £20 000 in £1 shares. To acquire from Burnham & Company, of St. Paul's Wharf, Deptford, S.E. 8, the benefit of certain existing inventions relating to wireless telegraphy or telephony, &c. Subscribers : A. W. Slade and F. A. Saxon. Registered office : 391, Strand, W.C. 2.

Cambrian Electrolytic Zinc Company.

The Cambrian Electrolytic Zinc Company, Ltd. Registered March 30. Nominal capital of £50 000 in 185 000 participating preference shares of 5s. each and 75 000 ordinary shares of 1s. each. To acquire the undertaking of the Lisburne Development Syndicate, Ltd., and the Welsh Mines Corporation, Ltd., to acquire any mines, oil, or mining rights and metalliferous or other land in the U.K. or elsewhere, to adopt the process known as the "Electrolytic deposition of zinc," and to carry on the business of miners, preparers for market of ores, metals, precious stones and minerals, &c. First directors : Newman Goldman, C. S. Quartermaine and E. A. Wakefield. Registered office : 80, Bishopsgate, E.C. 2 The file number is 180 746.

Globe Supplies (Electrical), Ltd.

Globe Supplies (Electrical), Ltd. (180 704). Private company. Registered March 29. Capital, £500 in £1 shares. To carry on business as indicated by the title. Subscribers : F. Bruce and J. R. Whitehouse. Solicitor : C. H. R. Taylor, 17, Charing Cross-road, W.C. 1.

C. E. Heinke.

C. E. Heinke, Ltd. (180 856). Private company. Registered April 3. Capital £50 000 in 49 950 ordinary shares of £1 each, and 1 000 employees' shares of 1s. each. To enter into an agreement with F. H. Sprang, E. C. Lacey, and J. H. Blake, and to carry on the business of manufacturers of internal combustion and other engines, manufacturers of vacuum, compression and other pumps, mechanical, scientific and surgical instruments and machinery, electrical and chemical engineers, &c. First directors : F. H. Sprang, E. C. Lacey, and J. H. Blake. Secretary : W. Norman. Registered office, 87, Grange-road, Bermondsey, S.E. 1.

Hill & Boll (Bridport), Ltd.

Hill & Boll (Bridport), Ltd. (180 935). Private company. Reg. April 5. Capital, £2 000 in £1 shares. Mechanical, electrical, and consulting engineers, engineering contractors, &c., and to adopt an agreement between F. W. Boll and S. R. Edwards. First directors : F. W. Boll and S. R. Edwards. Secretary : T. W. Cockeram. Registered office : 71-73, East-street, Bridport.

Kilrush Electric Lighting and Power.

Kilrush Electric Lighting and Power Company. Private company. Reg. in Dublin March 31. Capital, £5 300 in £1 shares. To carry on at Kilrush the business of an electric light company in all its branches. Subscribers : D. Ryan (500 shares), T. J. Mahony (1 000 shares), G. Brew, J. Saunders, P. O'Shea, P. Tubridy, and G J. Cantwell. Registered office : Burton-street, Kilrush.

Neon Lights.

Néon Lights, Ltd. (180 617). Private company. Registered March 25. Capital, £10 000 in 7 500 10 per cent. cumulative participating preference shares of £1 and 5 000 ordinary shares of 10s. each. To acquire the rights and other interests in the agency and concession for the U.K. granted to E. Bailey, trading as the Electrograph Company, of 9, South Side, Clapham Common, S.W., under an agreement between himself and Paz & Silva, of Paris, for 3 500 fully paid 10 per cent. preference and 3 000 fully paid ordinary shares, and to carry on in the U.K. or elsewhere the business of manufacturers and factors of, agents and advertisement contractors for, and dealers in Néon lamps and lights and any electrical, scientific, mechanical and other device in which the said lamps and lights can be used, &c. Life directors : A. G. Read (Read & Leney, advertising agent and managing director) and E. Bailey. Registered office : 115, Baker-street, W. 1.

A. Peckston.

A Peckston, Ltd. (180 849). Private company. Registered April 3. Capital £1 000 in £1 shares. To take over the business of an electrical engineer carried on by Austin Peckston at 42, Wilson-street, Middlesbrough. Permanent directors, A. Peckston, (managing director), and A. W. Foster. Registered office : 42, Wilson-street, Middlesbrough.

COMMERCIAL INTELLIGENCE.

County Court Judgments.

[NOTE.—The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction of the cases. Judgments are not returned to the Registry if satisfied in the Court books within twenty-one days.]

BLISS, Mr. E. H., 19, Westbourne-crescent, Canton Bridge, Cardiff, electrical goods dealer. £42 2s. 11d. Feb. 10.

CALDWELL & SONS, 26, Victoria-road, Hale, electrical engineers. £11 14s. Feb. 10.

CLYNE & DEAKIN, 84, Tilton-road, Small Heath, electrical engineers. £18 8s. 2d. Feb. 8.

ELECTRICAL MACHINERY COMPANY, 22, Pownall-square, and 36, Smithfield-street, Liverpool, electrical engineers. £39 16s. 10d. Feb. 7.

ENGINEERING PLANT CONTRACTORS, LTD., 377, Waterloo-road, Cheetham Hill, machinery merchants. £17 15s. Jan. 31.

FRANCIS, Mr. W., 4, Prospect-place, Cheam, electrical engineer. £16 4s. 6d. Feb. 7.

RAWLINGS & COMPANY, 33, Broad-street, Hereford, electrical engineers. £28 6s. 1d. Feb. 10.

VENN BROS., 39, Turnham Green-terrace, W. 4, electrical engineers. £18 0s. 3d. Feb. 2.

WELLINGS, Mr. H. R., Ironmarket, Newcastle, electrical and sanitary engineer. £23 7s. Feb. 7.

Receivership.

BRITISH DIATORIC MANUFACTURING COMPANY, LTD. W. J. Kershaw, of Talbot House, 9, Arundel-street, Strand, W.C., ceased to act as receiver or manager on Feb. 22, 1922.

London Gazette.

The following information is taken from printed reports, but we cannot be responsible for any errors that may occur.

Company Winding-up.

SWIFT ELECTRICAL, LTD. Registered office, 6, Cork-street, Old Bond-street, London. Winding-up order, April 4.

Bankruptcy Information.

BATE, Douglas Clavell, 16, John Dalton-street, Manchester, electrical manufacturer and supplier. Receiving order, April 4. Debtor's petition.

CAMP, William, Carr-lane, Slaithwaite, Huddersfield, under the style of WILLIAM CAMP & COMPANY, electrical engineer. Receiving order, April 4. Debtor's petition. First meeting, April 21, 1.15 p.m., and public examination, May 8, 11 a.m., County Court House, Queen-street, Huddersfield.

OLDFIELD, Herbert, 51, Milton-terrace, High-street, Heckmondwike, electrical engineer. First meeting, April 20, 10.45 a.m., and public examination, May 4, 11 a.m., County Court House, Dewsbury.

Notice of Dividend.

WORMULL, Frederick Alfred Stanley, 17, Bellingham-terrace, Bromley-road, Catford, S.E., electrical engineer, and at 273, High-street, Lewisham, as the LEWISHAM ELECTRIC WIRING COMPANY. Amount per £, 4s. 10¾d. First and final. Payable, April 24, 29, Russell-square, W.C. 1.

Notice of Intended Dividend.

BECKETT, Samuel, Junior, 50, Deane-road, Bolton, Co. Lancaster, electrician. Last day for receiving proofs, April 22. Trustee, J. G. Gibson, Byrom-street, Manchester.

Partnerships Dissolved.

LEITCH, John, and SMITH, Thomas, designers and manufacturers of electric light fittings, 4, Ramillies-place, Oxford-circus, under the style of THE MARYLEBONE ELECTRIC FITTINGS COMPANY, by mutual consent as from March 13, 1922. Debts received and paid by J. Leitch, who will continue the business.

THORPE, George, WILLERS, Hugo Hermann Carl Johann Ludwig, PRECIOUS, Halliday, and PRECIOUS, Alfred, general importers of electrical goods, &c., at 78, Olympia-street, Burnley, under the style of THORPE, WILLERS & COMPANY, by mutual consent as from Feb. 24, 1922.

VINCE, Henry James, and HUNT, Henry James, electro platers, at Whippet Works, Falcon-terrace, Clapham Junction, S.W. 11, under the style of JAMES VINCE & COMPANY, by mutual consent as from Jan. 1, 1922. Debts received and paid by H. J. Hunt, who will continue the business.

Edinburgh Gazette.

BRASH, James, and RUSSELL, Robert M., trading as BRASH & RUSSELL, electrical, &c., engineers, 438, Baltic-street, Bridgeton, Glasgow. Firm dissolved, by mutual consent, as at March 31, 1922.

M'KINNON, Hugh, and BUCHANAN, John R., under the name of THE AUTO ELECTRICAL EQUIPMENT COMPANY, at 119 and 121, Bothwell-street, Glasgow. Firm dissolved March 18, 1922. The business will be continued by J. R. Buchanan, who will receive and pay all debts.

Bankruptcy Proceedings.

KERSHAW, Arthur, and WOOD, Charles Herbert, trading as KERSHAW & WOOD, 9, Bradford-road, Dewsbury, Yorkshire, electrical engineers and merchants. The application for discharge of these debtors was heard last week. The Official Receiver stated that they filed their petition in 1920, when the ranking liabilities amounted to £4 796 and the assets realised £1 437. A first and final dividend of 4s. in the £ was paid, and the debtors now offered to pay jointly a sum of £25 a quarter for two years, making a total of £200, for the benefit of the creditors. The discharge was granted, subject to the payment of the quarterly sums of £25 for two years.

LUDLOW, Jesse Frederick, and LUDLOW, Robert Redvers, in partnership as LUDLOW BROS., 196, Church-road, Redfield, Bristol, electrical contractors. The receiving order in this matter was made on March 29 on debtors' own petition. The statement of affairs shows liabilities of £307 against net assets of £53, a deficiency of £254. Debtors attribute their failure to want of capital, bad trade, and depreciation of stock. It appears that in October, 1919, with a total capital of £15, they started business as electrical contractors at their present address. The business does not seem to have been successful from the start, and they became aware of their position in March, 1921. A full set of books has not been kept.

Catalogues, Price Lists, &c.

A new price list of SIMPLEX ELECTRICAL ACCESSORIES (List No. 939), has just been brought out by Simplex Conduits, Ltd.

An illustrated leaflet has been received from J. H. Jerrim & Company, giving details of the "FIXIE" GRIPS manufactured by the firm. The stock sizes vary from 7½ in. by 3½ in. to 34½ in. by 13 in., and the prices from £2 14s. 6d. to £29 5s.

A new illustrated list of L.T. IRONCLAD SWITCH AND FUSE GEAR for lighting and power purposes has just been published by the Midland Electric Manufacturing Company, and includes many entirely new designs and many improvements on old patterns.

THE RAWPLUG COMPANY have just issued an attractive sixteen-page booklet, in which the use and application of Rawplugs, as applied to the various trades interested, are fully described and enumerated. A substantial reduction in the price of Rawplug toolholders is announced.

In view of the great variety of purposes for which PARSONS' ENGINES are now used as power units, the firm have published in book form a collection of illustrations and designs of engines employed for dynamo driving, pumping, &c. The book does not deal with prices, weights, and other technical information, all of which the firm will forward on application.

The latest pamphlet of the ELECTRIC CONSTRUCTION COMPANY deals with the multi-speed induction motors which are now being manufactured by the firm under Creedy's patents. The general design and the advantages claimed for this machine are well known to readers of THE ELECTRICIAN, and it is not unlikely that for certain applications it will find an increasing use, especially with the development of three-phase distribution. The pamphlet contains a great deal of both technical and commercial information, and should be referred to by all those interested in the subject.

Arrangements for the Week.

TUESDAY, April 18th.

INSTITUTION OF ELECTRICAL ENGINEERS.
EAST MIDLAND SUB-CENTRE.

6.45 p.m. At Loughborough College, Loughborough. Lecture on "Electric Vehicles," by Mr. R. J. Mitchell.

WEDNESDAY, April 19th.

INSTITUTION OF ELECTRICAL ENGINEERS.
(SHEFFIELD AND DISTRICT TERRITORIAL SUB-CENTRE.)

7.30 p.m. At Royal Victoria Hotel, Sheffield. Visit of the President, Mr. J. S. Highfield, and Smoking Concert.

FRIDAY, April 21st.

ELECTRICAL POWER ENGINEERS' ASSOCIATION.

7 p.m. At Essex Hall, Strand, London, W.C. General Meeting.

JUNIOR INSTITUTION OF ENGINEERS.

8 p.m. At Caxton Hall, London, S.W. Paper entitled "Condenser and Choke Coil Protective Apparatus," by M. S. A. Stigant.

Patent Record.

SPECIFICATIONS PUBLISHED.

The following abstract from some of the specifications recently published have been specially compiled by Messrs. Mewburn, Ellis & Co., *Chartered Patent Agents, 70 and 72, Chancery-lane, London, W.C.*

Complete Specifications.

145 698 Balslev, J. V., & Thode, A. Automatic maximum electric switches. (15/12/17.)
145 755 Ohio Brass Co. Electric insulators. (29/5/16.)
145 778 Siemens-Schuckertwerke Ges. Electrodes for vacuum electric discharge apparatus. (7/12/18.) (Addition to 145 676.)
146 517 Western Electric Co., Ltd. Telephone systems. (14/6/19.)
146 532 Radio Corporation of America. Methods of and apparatus for radio signalling. (6/1/16.)
146 534 Radio Corporation of America. Apparatus for dealing with feeble electric impulses as in wireless telegraphy. (24/2/15.)
146 535 Radio Corporation of America. Receivers of electrical oscillations. (25/4/14.)
146 537 Radio Corporation of America. Thermionic valves. (10/3/17.)
146 353 Siemens & Halske Akt.-Ges. Electric amplifiers. (7/7/16.)
146 357 Stoekle, E. R. Thermionic vacuum tubes. (13/6/17.)
146 864 Compagnie General d'Electricite. Electric lamps, particularly those for motor vehicles. (4/2/19.)
146 903 Siemens & Halske Akt.-Ges. Method of detecting the effects induced by alternating currents flowing through conductors laid in fairways for vessels. (18/12/18.)
147 013 Siemens & Halske Akt.-Ges. Method for reducing the overtalking and overhearing in long-distance two or four-wire circuits. (22/3/19.)
147 434 Ges. für Drähtlose Telegraphie. Wireless telegraph transmitters. (20/10/17.)
147 465 Soc. Francaise Radio Electrique. Electro-magnetic wave transmission systems. (9/7/19.)
147 554 Marks, E. C. R. (Siemens-Schuckertwerke Ges.). Electric arc welding apparatus. (2/7/20.) (Convention date not granted.)
147 821 British Thomson-Houston Co. Ltd. Brush shifting apparatus for alternating current electric motors. (13/2/18.)
147 831 Gross, F. Method of and means for manufacturing electric incandescent lamps. (29/6/20.)
147 837 Ges. für Drähtlose Telegraphie. Multiplex telephony. (14/12/18.)
147 949 Cohn, Sen. A. (Firm of). Secret combination electric selecting or like devices. (22/4/19.)
148 134 British Thomson-Houston Co. Ltd. Electron discharge apparatus. (29/12/13.)
148 312 Huth Ges., Dr. E. F., & Loewe, S. Telephony. (31/12/15.)
148 315 Huth Ges., Dr. E. F. Aerial conductors for wireless telegraphy and winding apparatus therefor. (1/7/15.)
148 319 Huth Ges. Dr. E. F. Reels and the like for winding and unwinding aerial conductors. (16/5/18.)
148 401 Lorenz Akt.-Ges. C., & Schmidt, K. Methods and circuit arrangements for generating pure continuous electric currents by means of machines. (13/2/19.)
148 423 Signal Ges. Electro-magnetic vibratory devices. (12/7/15.)
148 444 Ges. für Drähtlose Telegraphie. Multiplex telephony. (27/5/19.) (Addition to 147 837.)
148 530 Ges. für Drähtlose Telegraphie. Antenna systems for receiving electric waves. (18/6/18.)
152 327 Etablissments Deesse. Distributor for magneto. (8/10/19.)
158 215 Rail Welding & Bonding Co. Electric arc welding. (26/1/20.)
164 298 Herrmann, H. Electric insulators and their manufacture. (4/6/20.)
169 768 Automatic Telephone Manufacturing Co., Ltd., Bates, P. T., & Newall, A. V. Arrangement for controlling the length of conversions for telephone or like purposes. (23/6/20.)
169 772 Barker & Sons, Ltd., J. & Saxton, J. Locking devices for electric and other hoists. (24/6/20.)
169 773 Plant, J. W. Method of electrically welding steel. (24/6/20.)
169 788 Codd, L. B., & Martin, C. Holders for electric incandescent lamps. (2/7/20.)
169 795 Simms, W. H. (General Railway Signal Co.). Electrically operated switch machines for railways. (2/7/20.)
169 812 Haines, L. F. Automatic distant control of hydro-electric and other machinery. (6/7/20.)
169 817 Murray, J. Erskine-. Electrical resistances of the thermionic type. (6/7/20.)
169 818 Carney, H. A., Bowden, J. H., Thompson, H. F. J., & Johnson & Phillips, Ltd. Protective devices for electric alternating current distribution systems. (6/7/20.)
169 822 Ziegenberg, R. Galvanic batteries and electric safety lamps. (6/7/20.)
169 845 Ree, J., Radio Communication Co., Ltd., & Turner, L. B. Three-electrode ionic tubes. (13/7/20.) (Addition to 139 867.)
169 849 Hill, T. H. Wireless directional transmission and reception apparatus. (16/7/20.)
169 853 Conner, M. S., & Puckette, C. C. Driving of magneto-ignition apparatus for internal combustion engines. (19/7/20.)
169 889 British Thomson-Houston Co., Ltd. (General Electric Co.). Vacuum tube devices, especially such devices in which an electron current is controlled by a magnetic field. (25/8/20.)
169 899 Moy, E. F., & Bastie, P. H. Automatic electric circuit-breakers. (13/9/20.)
169 904 Hunt, A. H., & Goddard, J. W. Electric lamp holders. (21/9/20.)
169 915 Metropolitan-Vickers Electrical Co. (Westinghouse Electric & Manufacturing Co.). Electrical transformers. (4/11/20.)

APPLICATIONS FOR PATENTS

March 27, 1922.

8 721 A. M. Taylor. Regulation on long distance transmission lines.
8 756 Petro-Flex Tubing Co. & A. E. MacDonald. Insulated wires, &c.
8 763 J. H. Broome. Device for transmitting electrical impulses by means of balls, discs, &c.
8 765 J. H. Broome. Device for receiving and transmitting electrical impulses.
8 773 F. Krupp Akt.-Ges. Overland circuit breakers. (25/4/21, Germany.)
8 785 W. Morell Akt. Ges. Counting and indicating device for telephone calls, &c. (17/10/21, Germany.)
8 786 Western Electric Co. Vacuum pumps. (20/6/21, U.S.)
8 787 Metropolitan-Vickers Electrical Co. Systems of electrical distribution. (3/6/21, U.S.)
8 793 Siemens & Halske Akt.-Ges. Telephone systems. (31/3/21, Germany.)
8 811 S. G. Barker. Multi-filament electric lamps.
8 813 B. T.-H. Co. (G. E. Co.). Vibration indicators.
8 822 C. F. Killar. Short-circuiting devices.

March 28, 1922.

8 825 E. Y. Robinson. Systems of reception for modulated wave telegraphy and telephony.
8 830 H. S. Hutchison. Sparking electrode for sparking plugs.
8 842 E. Marchesi. Electric furnaces.
8 848 H. T. Boothroyd. Reversing gears operated by electro-magnetically actuated friction clutches.
8 880 P. W. Corless. Self-indicating sparking plug.
8 881 W. S. Kelly. Electric switches.
8 887 F. Krupp Akt.-Ges. Overland circuit breakers. (20/6/21, Germany.)
8 890 F. Krupp Akt.-Ges. Overland protective systems. (26/5/21, Germany.)
8 899 E. E. Kleinschmidt. Indicating mechanism for printing telegraphs.
8 904 B. T.-H. Co. (Cie Française Thomson-Houston). Braking systems for electric machines.
8 906 M. J. Railing & C. W. Saunders. Locking device for securing lamps to holders.
8 909 Coventry Automatic Telephones, Ltd. (Adams). Terminal banks.
8 910 Coventry Automatic Telephones, Ltd. (Arter). Machine switching telephone systems.
8 914 Western Electric Co. Telephone exchange systems.
8 915 C. A. Youldon. Electric motor for gramophones, &c.
8 917 G. C. Reed. Electric signalling system.
8 941 Felten & Guilliaume Carlswerk A. G. Equalising pairs of coils for loading pupinised 4-wire telephone lines. (22/10/21, Germany.)
8 943 Siemens & Halske Akt.-Ges. Telephone systems. (7/14/21, U.S.)

March 29, 1922.

8 952 S. P. Christie. Ignition circuit makers.
8 953 L. J. Rich. Three-electrode thermionic valves. (2/4/21, U.S.)
8 965 V. R. Nicholson. Electrically-driven lathes.
8 966 J. Timms. Storage batteries.
8 973 R. W. Dobson. Devices for wireless telegraphy, &c.
9 005 H. Cooper & B. Radley. Multiple-way switch for signs, &c.
9 009 L. T. & G. A. Walsh. Electrical illuminating machine.
9 021 Franco-British Electrical Co. & A. H. Brackensey. Time switches.
9 023 Cosmos Lamp Works & J. A. Orange. Metal filament incandescent lamps.
9 032 J. E. Calverley & W. E. Highfield. Electric converting apparatus.
9 034 P. T. Nielsen. Hand tools for connecting telephones, &c., wires to insulators.
9 063 P. C. Rushen (Siemens-Schuckertwerke). Electricity meters of electrolytic type.
9 083 H. Kennedy & Co. & P. Davey. Electric spark-gap apparatus.
9 084 L. S. Scher. Telephone mufflers. (21/4/21, U.S.)

March 30, 1922.

9 109 A. J. R. Riley. Electric lamps for cycles, &c.
9 114 F. L. Heppell. Electric egg tester.
9 122 Imperial Engineering Co., G. W. Close, & W. T. Pearson. Electric water heaters.
9 125 E. H. Cardwell. Electric ignition apparatus.
9 133 W. J. Beaver. Electrolier chains.
9 143 V. Hutchinson. Intercommunication telephone systems.
9 154 C. E. Garratt. Electric heaters or stoves.
9 159 Bartons & Sons & R. E. Barton. Electric conduit fittings.
9 178 E. Peruzzi & S. Preti. Multiplex printing telegraphy and radio-telegraphy. (31/3/21, Italy.)
9 179 M. J. Railing, F. J. Holtson, & T. Taylor. Electric switches.
9 180 M. J. Railing & A. E. Angold. Speed control of electric motors.
9 210 James Antifouling Appliances, J. B. Wilkie, & H. Neville. Mounting electrodes or electric discharge points in hulls of ships, &c.
9 219 B. T.-H. Co. & K. F. Hingwell. Telephone apparatus.
9 231 Soc. La Metallurgique Electrique. Electric installations 28/12/21, France.)

March 31, 1922.

9 252 J. Greenhalgh. Coupling for electric cables.
9 275 W. A. Powell & J. E. Price. Insulation for conductors.
9 291 H. Fletcher. Electric incandescent lamps.
9 294 Callender's Cable & Construction Co. & A. C. Wilson. Insulators.
9 296 G. V. Twiss. Means for attaching conductors to insulators.
9 298 M. Zeiler. Electric pocket lamps.

CONTENTS.

Notes of the Week.

The Straight Tip.

Placated by the concessions granted by Lord Peel and perhaps soothed by the shadow of the coming Easter holidays, the opposition to the Electricity Supply Bill died down into a distant rumble, which we hope presages the departure of the storm. If, however, it is but the calm before the renewal of the attack, we should like to draw the attention of those who are operating the thunder equipment behind the scenes to Lord Monk Bretton's straight tip. "Unless," he said, "the Bill went through in its present beneficial form the [London County] Council would have to consider whether the London companies should be granted an extension of tenure." Now the London electricity supply companies have always claimed, with some justice, that the menace of purchase in 1931 militated against their development. The Bill would remove that menace, and, as we showed the other day, the London companies are not definitely opposing the Bill. The opposition comes from another quarter, and, if persisted in, will bring punishment to the guiltless and leave the guilty much where they were before. This is realised by those concerned, to some extent, for the suggestion is now made that London is a separate problem which should be treated separately. This is a little ingenuous and will not excuse the opposition if their efforts bring about an *impasse*.

South-East Lancashire Electricity District.

With slight modification the Electricity Commissioners have sanctioned the scheme for the reorganisation of electricity supply in the South-East Lancashire Electricity District, and have thus made a concession to the independent, self-reliant Lancastrian spirit of which we hear so much. This has not been done without question, for the Commissioners evidently have a doubt, which we share, whether the proposed Advisory Board will be in as good a position as a Joint Authority to undertake comprehensive schemes of extension, or be able to provide adequate supplies in unoccupied areas. It has, however, been decided, in view of the almost unanimous support given to the voluntary arrangements made by the supply authorities, to set up an Advisory Board, though the number of representatives suggested is to be reduced, and the newly added areas of Buxton, Macclesfield, and other urban and rural districts are to have representation. If the parties cannot agree as to this necessary modification, the Commissioners will provide a scheme of their own.

Details of Technical Scheme.

The Engineer of the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board is to be a member of the Engineering Advisory Committee for limited purposes, and the Yorkshire Electric Power Company will not be required to submit plans of new works, but only such statistics as may refer to supplies in the company's areas in Saddleworth and Springhead. General approval has been given to the technical scheme, but it is thought that the actual layout of the lines and the method of working interconnected stations so as to produce the most economical results will be best effected by an officer of the Board appointed for that purpose. This officer would carry out the programme laid down by the Engineering Committee and approved by the Board. A scheme embodying this suggestion, which seems to us a necessary one under the circumstances, will have to be submitted for the approval of the Commissioners, and the Board are also required to submit, within two years, proposals for securing a supply in areas at present without one. It will thus be seen that the Commissioners' decision, while conciliatory towards conflicting interests, is eminently practical and joins up the loose ends of the administrative side of the original scheme.

A Useful Entente.

The subject of the closer co-operation or federation (whichever term is preferred) of engineering institutions

was toyed with by Mr. W. Noble Twelvetrees in his recent presidential address to the British Section of the Société des Ingenieurs-Civils de France. This section, it will be remembered, was founded some two years ago from those engineers who reside within the British Empire and yet are members of the parent society, the premier engineering institution of France. Its object is the furtherance of intercourse between British and French engineers, and the recruitment both of British engineers into the French Society and of French engineers into the corresponding British institutions by modifying the qualifications for membership to include equivalent British and French diplomas.

Federation or Progress.

These objects are most laudable, and we wish the section every success in its endeavour, as the mutual permeation of French and British ideas in this way must not only be for the good of the profession, but may also have the profoundest effect on the world's peace. But Mr. Twelvetrees, rather led away by natural enthusiasm for his theme, wishes to go a step further and bring about a federation of engineering institutions in this country with the same idea of advancing engineering progress. But though we agree most heartily as to the desirability of the end, we are not so sure about the means. Mr. Wordingham, in fact, called attention to the serious difficulties in the way of producing workable schemes for the federation of the engineering institutions in this country, but ascribed these to the jealousies and opposition of the smaller societies. But there is something much bigger than that in the way. For though concerned with the progress of engineering, the views of the three principal engineering institutions on how this progress is to be attained are widely dissimilar. To federate them would mean an emulsion rather than a mixture, and what is more important, a check to the advance of the more progressive among them. Though such federation would bring undoubted advantages in the establishment of a central library and other relatively minor matters mentioned by Mr. Wordingham, we are rather afraid that its disadvantages would outweigh them.

Mid-Lancashire Electricity District.

With two exceptions, schemes for the reorganisation of electricity supply in the whole of the Electricity Districts have now been prepared, and inquiries have been held by the Electricity Commissioners into the majority of them. So far there has been no local investigation by the Commissioners into any of the draft orders issued, though a start will be made next month, when the scheme approved for the South-West Midlands will be further considered. This slow progress is partly due to the absence of suitable legislation, and partly to the difficulty of getting the supply authorities to agree upon definite proposals. In the case of Mid-Lancashire, though the district was provisionally determined in May, 1920, it was only last week that a scheme, prepared by Blackburn and Preston Corporations, was submitted to the Commissioners, and even now the support of all the local authorities has not been secured, as some of the supply undertakings in the area from Accrington to Rawtenstall are submitting a scheme for a portion of the district.

The Parish Pump at Work.

In this district the position is not complicated by any company undertakers, and the delay has arisen solely owing to the lack of agreement between the local authorities. Even now the scheme, from the administrative point of view, is somewhat nebulous, and the responsibility for its ultimate shape rests upon the shoulders of the Commissioners. For instance, a Joint Electricity Authority *may*, and, if required by the Commissioners, shall be established, and the number of representatives appointed by each local authority is also left for the Commissioners to determine. The Authority *may* provide and maintain a capital generating station or stations on sites to be approved by the Commissioners, as well as main transmission lines or cables, transforming plant, and other incidental works, and it *may* provide for the supply of electricity in areas not at present supplied, either by including them in the district of adjoining distributors or by supplying such areas direct. The italics are ours.

Technical Details.

The technical side of the scheme, for which Mr. J. A. Robertson is responsible, is much more definite and more satisfactory. The supplies available in the district, which is an important industrial and manufacturing centre, are obtained from old stations, equipped with reciprocating sets, and nearly all produce direct current, though some of the works have modern turbine plant. Nearly all the stations are badly located for cheap generation, and it is, therefore, proposed that during the next nine years the whole of them, with the exception of Blackburn (Whitebirk) and Rawtenstall, should be gradually closed down, and that the normal supplies for the entire district should be furnished by three capital stations, at Preston, Blackburn and Burnley. These three stations will be interconnected, and when fully extended will be capable of meeting all the anticipated requirements, though for a time several of the existing works will be retained as peak load or emergency stations.

Possible Extensions.

The plant at Whitebirk will be extended from 20 000 to 30 000 kW during the period 1926-31; the initial capacity of the new Preston station will be 20 000 kW (to be extended to 40 000 kW before 1931), and of the Burnley works 20 000 kW (to be extended to 30 000 kW). It is hoped that Preston will be able to supply electricity by January, 1924, and the main transmission line between Preston and Blackburn will also be proceeded with, but the Burnley station will not be erected until the 1926-31 period. The system of supply is the standard 3-phase, at a frequency of 50 cycles per second. The main transmission pressure will be 33 000 V, and the local secondary transmission 6 600 V, to coincide with the pressure at present in use. It is stated that it may be possible in three or four years to adopt a 66 000 V pressure between Preston and Blackpool. A group of schedules give statistics of the existing undertakings and of the cost of the projected developments. The capital cost of the first portion of the scheme is estimated at £741 875, and of the second portion at £1 290 225, or a total of £2 032 100; but if individual development be permitted, the cost will be £2 234 000. The scheme would thus effect an annual saving of £22 710 on capital charges, £47 912 on coal, and of £25 000 on wages, stores and repairs, or a total saving of £95 622 per annum.

Help for the Electrical Industry.

It is not a little significant of the trend of industrial progress that out of a total of £14 958 145 guaranteed up to March 31 by the Treasury under the Trade Facilities Act no less than £12 020 100 is for schemes that are wholly or partly electrical. The largest sum of all is £6 500 000, which is guaranteed for twenty-five years to the South-

Eastern and Chatham Railways for the electrification of their London suburban lines, and next to this comes £5 000 000 for fifty years (a very long term) to the London Underground Railways for the enlargement of the tunnels of the City and South London Railway, the improvement of stations, the provision of new rolling stock, and the extension of the London Electric Railway from Golder's Green to Edgware. Details of all these schemes have already appeared in The Electrician. In addition, £500 000 for twenty-five years, but redeemable after fifteen years, has been guaranteed to the Calcutta Electric Supply Corporation for the purchase of additional generating plant, buildings, transformers, and high and low tension mains, £15 600 for twenty years to the Kent Electric Power Company for the provision of mains, transformers, and generating plant, and £4 500 for twenty-five years to the Minehead Electric Supply Company for the provision of generators and mains.

A Necessary Restriction.

The other grants, though not apparently electrical, are not unlikely, commercial knowledge and industrial conditions being what they are, to find their way in part into the coffers of electrical manufacturing firms, and so give a much-needed stimulus to the concerns in which we are most interested. There has been some criticism of the grant to the Calcutta Electric Supply Corporation on the ground that this fund is intended to relieve British labour. This, however, is a short-sighted view, as the plant will probably be purchased in this country, and its erection will be carried out under British supervision. On the other hand, we hope it will be made a condition of all these grants that the whole of the money shall be spent within the British Empire. For though it has been shown in certain cases that such restrictions are a bar to technical progress, no such obstacle need be expected in this case. British firms, British skill, and British labour are quite capable of carrying out all the work involved in these schemes. They should be given a chance to do so, especially as the British taxpayer is providing the money.

Provincial Supply Companies.

Though the majority of provincial electricity supply companies seem to have done moderately well during the past year, a few of them, especially those supplying towns seriously affected by trade depression, suffered a temporary setback. This is clear from the report of the Urban Electric Company, which controls no less than thirteen such undertakings in various parts of the country. The year's net profit of this concern showed an increase of about £9 000, mainly owing to an increase in the charges for electricity, but the company has only been able to pay a half-year's dividend on the preference shares, leaving four years' dividend in arrear. The result would have been better but for the serious drop in the output from the Hawick and Cornwall undertakings. In the former town the depression in the tweed trade, and in Cornwall the serious position of tin mining industry, resulting in the shutting down of practically all the mines, caused a great diminution in the demand.

Onerous Conditions Still Imposed.

It may truly be said that the position of some of the provincial undertakings during the War and since the Armistice has not been an enviable one. They are tied down by rigid price agreements with local authorities, and faced with great opposition to applications for increased charges to correspond with the higher costs. Even now, five of the Urban Company's undertakings are still being operated under the hampering conditions imposed by the Statutory Undertakings (Temporary Increase of Charges) Act of 1918, and though steps are being taken to obtain relief by means of special orders, it is probable that the Electricity (Supply) Bill, which makes provision for the periodical revision of charges and has now an excellent chance of success, may render this course unnecessary.

An Unfair Handicap.

It will be seen that the Urban Company has, like some other supply undertakings, been unfairly handicapped in the conduct of its business, but with falling prices and lower costs there should be a gradual return to the conditions of 1914, when, though the majority of the undertakings only paid an exiguous dividend on the ordinary shares, they did at least pay something. If, however, the company is to earn an adequate rate of interest and is to secure permanent prosperity greater efforts will have to be made to increase the domestic load, and as the present high charges militate against progress in this direction, there must be a reduction in the prices charged as soon as possible. In many urban areas, as we have often pointed out, the domestic field has hardly been tapped, but with suitable propaganda and an attractive tariff considerable progress can and should be made.

Iniquity of the Corporation Profits Tax.

The outlook would, however, be brighter were it not for the Corporation Profits Tax and the rising rates and assessments. Though the Corporation Tax will not affect the company until the end of this year, it is a particularly vicious form of taxation, inequitable and discriminating in its incidence. As local authorities who own electricity supply or other public utilities are exempt from the tax, it is manifestly unjust to impose it upon companies. The latter are, many of them at all events, operating under a limited tenure and other restrictive conditions, and unless the tax is abolished, or a further period of exemption is granted, the result will be that the ordinary shareholder and the electricity consumer will have to bear the burden between them, and electrical and industrial progress will be checked. Where a tax is unfair in its incidence it should be abolished, and we hope that this will be the fate of this obnoxious impost.

The Law Regarding Supply Services.

The question whether electricity supply undertakings should make a charge for connecting installations to their mains is one which has been exhaustively debated from all sides. But whatever the opinion held, it is just as well to know the law on the matter, for even some undertakers do not seem to be clear on the legal position. The obligations of an undertaking to connect installations is laid down in Section 27 of the Electric Lighting (Clauses) Act, 1899. Undertakings must give a supply to all premises within 50 yds of any of their distributing mains. But the undertaker may insist on the prospective consumer paying for that part of the services which runs through the private property. In other words, the undertaker, at most, is only legally obliged to bring the supply just inside the gates, and the consumer is liable for the rest. But this is not all: if the distance from the distributing main to the gate is over 60 ft., then the undertaking can also insist on the consumer paying for all the excess. That is, the undertaking is obliged to pay for, at the most, 60 ft. of service cable along the public highway, and the consumer can be asked to pay for the remainder.

The Newspaper Press Fund.

The technical Press is, by its organisation and duties, rather a hybrid piece of mechanism. It has, as it were, to travel towards two goals at the same time; one of which is the acceleration of engineering progress, and the other the maintenance of all that is best in journalism. To its readers it turns mainly the first of these faces, but, privately, those who are responsible for its conduct are not the less associated with its other aspect. It is, therefore, without the least diffidence that we call attention in these columns to the claims of the Newspaper Press Fund, which was founded in 1864 for the relief of necessitous members of the literary departments of the Press, and for the widows and families of such persons. This fund follows tradition to the extent that each year it appeals by means of a dinner to the pockets of the widest possible public for the assistance and the recognition of a body of men whose work is not only useful, but is carried on under conditions of stress that make premature breakdown a frequent occurrence. This year the dinner is to be held on April 27, at the Hotel Victoria, London, under the chairmanship of Lord Leverhulme, and the occasion will be seized to make an attempt to meet a serious deficit in the receipts, which now amount to little more than half the amount distributed in grants and pensions. The Honorary Secretary is Mr. S. G. Smeed, 11, Garrick-street, London, W.C. 2. *Verb. sap.*

Imperial Water-Power Progress.

Notwithstanding the universal trade depression, the employment of hydro-electric power in Canada continues to develop, for it is calculated that the amount of new plant installed in the past year was 300 000 h.p., a figure which is above the average. This additional plant represents both extensions to existing stations and a fair amount of new construction work, and it is satisfactory to learn that the additional power available is due to Government, municipal, and private enterprise.

Rapid Progress in Canada.

In Ontario nearly 174 000 h.p. in new units were installed, making the total development of water power in that province about a million and a quarter horse-power; in Quebec 89 290 h.p. were added, bringing the total to over one million horse-power; and substantial increases were also recorded in Manitoba, New Brunswick, and Nova Scotia, making the aggregate developed water power in Canada at January last 2 755 980 h.p. This figure is less than a sixth of the estimated available power at ordinary minimum flow, so that there is still plenty of room for expansion even when allowance is made for the large amount of construction work in hand and projected. The recorded power available throughout the Dominion, calculated on the basis of 24-hour power at 80 per cent. efficiency, and under conditions of ordinary minimum flow, has been calculated at 18 255 000 h.p., while 32 076 000 h.p. can be depended upon for at least six months of the year.

Co-operation in Survey Work.

As regards organisation, each of the provinces appears to have its Power Commission, and very useful work is being done in completing surveys and in settling questions of general policy. The Dominion Water Power Branch is co-operating with these Provincial Commissions, and the results are reported to be most satisfactory. For the increased uniformity in methods of investigation has led to greater efficiency and economy. Excluding the Province of Quebec, and apart from special investigations of water-power sources, there are now about 570 stream measurement stations in the Dominion. This figure will give an indication of the importance attached to hydro-electric power in Canada and is a proof of the earnest desire of the Government to utilise its natural resources as far as possible in the best and most scientific way.

Large Units More Used.

There is an increasing tendency to use large units. For instance, on the Queenstown-Chippawa development the turbines will be of 55 000 h.p., and are stated to be the largest of the kind in the world, while at the Du Bonnet Falls on the Winnipeg River the Manitoba Power Co. proposes to erect six units of 28 000 h.p. each. Turbine sets of 5 000 to 16 000 h.p. are now quite common throughout the Dominion. This, though not up to the German standard, is getting on.

Another interesting feature is the fact that a large amount of power is being taken by paper and pulp, lumber, and saw mills, mining and other industries. In fact, new work is mainly undertaken in order to meet industrial requirements. Another development is the increase in the number of rural transmission lines and the extended use which is being made of electricity in farmhouses and in agricultural operations. In the Province of Ontario legislation has been passed to allow a bonus of 50 per cent. for rural power distribution, and as this enabled the Hydro Electric Commission, which supplies a large number of municipalities and rural areas, to quote special rates for rural services, there has recently been a great demand for a supply from farmers. In fact, at the end of the financial year, 1920, the Commission had 1 120 farm services, and it is reported that as a result of special propaganda about 3 500 rural contracts were signed in the latter half of 1921.

Some Financial Details.

Naturally, it would be interesting to have figures of the financial results of all this activity, but so far only the accounts of the Hydro Electric Power Commission for 1920 are available. The annual report states that the results of the year's operations were the most successful in the history of the Commission, though business depression affected adversely the Eugenia and Severn systems. On the large Niagara system the drop in the industrial load was more than compensated for by the increased demand from the municipalities, and towards the end of the year the general growth in business was such that there was not sufficient power to meet the demand, and new customers could not be connected. The total revenue of the Commission was $4 513 404, and after deducting the cost of power, interest, depreciation, and maintenance there was a balance of $714 735 for renewals and contingencies, but when all expenditure was met and the statutory reserves were provided there was a deficit of $147 464, the cost of service to all municipalities exceeding the year's estimate by only 3·16 per cent.

By means of connecting links between the various systems operated by the Commission the surplus power of any one of them is supplied to make up the deficiency of the others, and in this way a more normal and reliable service is maintained.

State versus Municipal Enterprise.

It is generally claimed that electricity supply is cheaper in the area served by the Hydro-Electric Commission of Ontario than elsewhere, but in a long and elaborate

report of over 225 pages to the National Electric Light Association Mr. W. S. Murray, the American expert, asserts that it is not so cheap or so reliable as that given by privately-owned companies in Canada and the United States. The report, which deals with the history and development of the Commission, was prepared in order to obtain economic data of Government and private enterprise in Canada for the guidance of those entrusted with the control and development of water power in America. As the system of the Hydro-Electric Power Commission of Ontario is the largest Government-owned electricity undertaking in existence it naturally came in for close examination, but Mr. Murray's conclusion is that no such system should be employed in the United States, his grounds being that it is subversive of American policy and custom, and, moreover, it is inefficient, expensive and wasteful. Pretty definite this! There is a natural predilection in favour of private enterprise in the United States, though we think that Mr. Murray has proved his case.

Government Service More Costly than Private.

In Ontario, of the total utility income in 1920, two-thirds was derived from those owned by the Government, but in Quebec, where the income from the same class of utilities was only five per cent., the cost of power is 32 per cent. lower, while the productivity of salaries and wages is 32·5 per cent. higher. In capital cost the Commission also compares unfavourably with private undertakings. Formerly it purchased 100 000 H.P. from the Ontario Power Company at about $9 per H.P.-year, and in 1920 the municipalities were supplied with power at $17·65 per H.P.-year, but from the new Queenstown-Chippawa development the cost will be $28·05 per H.P.-year. In consequence of these higher charges and for other reasons the Provincial Legislature has now decided to appoint a Royal Commission to investigate the administration and working of the Hydro-Electric Commission.

General Principles.

Mr. Murray concludes by affirming certain principles, which, though invoked in support of American policy, apply equally well to this country. He states that "accomplishment by individuals in control of private enterprise is under keener observation than is the case when those in charge are Governmental or municipal officers. Governmental ownership eliminates all incentive for gain and throttles initiative. The Hydro-Electric Power Commission is judge of its own acts, and a commission cannot fairly be the judge of its own (and others') rights in disputes. The Commissions of the States fully realise that protection to the people lies in protection to the electric utilities from which they are receiving power. The authority delegated to them to regulate rates, and the constitutionality of the law standing behind any action on their part or on the part of the electric utilities, provides a structure constructively balanced to do justice to all parties."

Principles Not Applicable to Canada.

There will be few who will challenge the main conclusions of Mr. Murray, though the situation in Canada is not analogous to that of the United States. The use of water power and industrial development have reached a more advanced stage in the latter country than in Canada, where many large falls occur in remote and uncultivated districts. In remote areas, where there is little or no demand for power, private enterprise cannot be induced to commence operations. Consequently, Government or municipal aid may be necessary for developing the natural resources of Canada, when it would not be required in the United States where the public utility commissions seem to be giving satisfaction to all parties.

The Situation in India.

Turning to India, where extensive hydro-electrical development is also being undertaken, though in actual construction work it cannot compare with Canada, yet we are pleased to see that progress is being made with the hydro-electric survey, under the superintendence of Mr. J. W. Meares. In India, as we have recently pointed out, there is really greater need of water-power and industrial development than in other parts of the Empire, for it has been acutely affected by trade depression, and no small part of the present unrest is attributable to unemployment. For economic reasons it has been decided that outlay on water storage and water power shall in future be a provincial charge, and we are therefore afraid that the good work which has been done by Mr. Meares may suffer a set back. The third triennial report has recently been published and is divided into two main sections. The first gives technical information and data on development for the guidance of engineers engaged on the actual work of survey, and in the second part 118 pages are devoted to a forecast of the water-power possibilities of the provinces.

Results of Survey.

In the preliminary forecast of the water power at present investigated it is stated that the total power, based on figures of the minimum continuous power available, amounts to 5 582 000 kW, or 7 400 000 E.H.P. Of this total only 213 140 kW has been developed, but four plants of 55 640 kW are under construction. Only in Bombay, Jammu and Kashmir, and in Mysore has there been any serious attempt to utilise water power, though Bihar and Orissa, with an estimated output of over one million horse-power, the North-West Frontier Province, with about a million horse-power, Burma, with nearly a million, and the Punjab, with about 800 000 H.P., are richer in waterfalls. Bengal and Bombay are respectively credited with 670 000 and 644 000 H.P., and there are also substantial amounts to be developed in Assam, the United Provinces, Jammu and Kashmir, and the Central Provinces. Of 1 125 sites and projects listed only 52 have been investigated, and it is probable that the estimate given will be greatly exceeded. In fact, it is stated that the probable ordinary minimum power will amount to over 7 500 000 kW, and the maximum power is put at 12 680 000 kW. If a substantial portion of this large amount of power were developed it would have a most beneficial effect upon the industrial and social position in India, and it would also provide a useful market for British hydro-electric plant and apparatus.

Fresh Legislation Required.

Progress cannot, however, be made until the legislation relating to water-power concessions has been amended so as to attract capital to the industry, and, in addition, Government support and sympathy will be needed for some time in order to encourage the establishment of subsidiary industries. Many of the estimates given in the present report are not final because the survey has not yet been completed on account of the magnitude and difficulty of the work. It must be remembered that, excluding Russia, India is equal in area to the rest of Europe, and as the transport facilities in certain places are very poor we think that the work accomplished by Mr. Meares and those under him is highly creditable, and in due course it will prove of great value to the Indian Empire and the electrical industry.

The Electrostatic Wattmeter.

By G. L. ADDENBROOKE.

The author gives an historical review of the application of the quadrant electrometer to the measurement of alternating currents and dielectric losses and details improvements which he has recently introduced into a new set of instruments. After studying the theory and action of the instrument at some length, he points out that it is mathematical rather than electrical in character, and shows how it may be applied to modern precision measurements.

Historical.

It is difficult to say exactly what the sensitiveness of the Kelvin electrometer was, but in 1882 Hopkinson read a Paper before the Physical Society, from which it may be gathered that working under normal conditions, the constant of his instrument was about 0·33—that is, with 100 V on the needle and 1 V between the quadrants, the deflection would be of the order of 33 mm. on a mm. scale at 2 m. distance. In concluding this Paper, Hopkinson says :

> The invention of the quadrant electrometer by Sir W. Thomson may be said to have marked an epoch in electrostatics, and the instrument from time to time finds new uses. It therefore seems well worth while to make known observations made upon it in which the instrument itself has been the only subject studied.

Application to A.C. Measurements.

Although Hopkinson does not say so, I know he had in his mind in this study the question of the application of the instrument to alternating measurements. Some three years later, I built and began to study an instrument of this type myself. Consideration satisfied me that there were primarily two desirable alterations needed to adapt the instrument for alternating measurements. The first was to get rid of any uncertainty implied in charging the needle alternately through sulphuric acid, as in the Kelvin and other instruments of the time. Secondly, an increase in sensitiveness was very desirable.

It was not until several years later, viz., about 1898, that Colonel Crompton, who was working at improving the D'Arsonval galvanometer gave me some phosphor bronze strip finer than had been obtainable so far. This met the first of the above points, and at the same time the sensitiveness of the instrument could be increased about three times, that is, under the above conditions, 1 V between the quadrants with 100 V on the needle, could be made to give 100 scale deflections readily.

It was on this basis that the instruments were constructed which I described in the paper I read at the Paris Electrical Congress, a copy of which appeared in THE ELECTRICIAN in 1900*. I mention this because a certain number of these instruments are still in use.

Application to Measurement of Dielectric Losses.

About 1900 dielectric losses in cables and other insulating materials were beginning to attract attention. Having mentioned the matter to the late Dr. Muirhead, he was good enough to place at my disposal at this time a condenser of five separate microfarads as built by him for submarine cable work. I had means of generating alternating voltages of 83 ~ up to 1 200 V, and it was found that these condensers would stand this P.D. without strain. The instruments were therefore connected up in circuit with these condensers by means of a shunt with a ratio of about 10, and with a drop of about 15 V in the series resistance inserted between the quadrants. Everything seemed in order, but the wattmeter gave a minus reading.

On looking into Maxwell's formula it seemed correct that it should do so with a shunt of such multiplying power if the power factor was below a certain value, but to make sure I wrote to Dr. Russell, who came to see the experiment and some variations.

Measurements at Low Power Factors.

Dr. Russell on the data obtained then suggested the formula which I used in two articles in THE ELECTRICIAN in 1901, which covered a preliminary investigation of the working of the instrument at low and high voltages and at high and low power factors. This formula Dr. Russell describes in his book on alternating currents.

* THE ELECTRICIAN, Vol. XLV., p. 901.. Oct. 5th, 1900.

Working in America, Miles Walker, in June, 1902, in the Journal of the A.I.E.E., described experiments on somewhat similar lines, and made a number of suggestions for coupling up the instrument to circuits which are worthy of attention.

Since then not much has been published on the use of the instrument at low power factors, until Mr. Parry's Physical Society Paper last year, though I have continued to use it in my work on dielectrics.

In 1902 I was asked to experiment on high tension paper cables for Henley's Telegraph Company, as uneasiness on the subject had arisen owing to a Paper by Mr. Mordey at the Institution of Electrical Engineers, which provoked a long discussion. These experiments, which were very complete for the date, showed power factors a little under 1·75 per cent., though to get them, working with 100 V on the needle and a shunt of about 60 ratio, we used as much as 20 V drop across the quadrants.

The instruments were not arranged to the best advantage; it was a case of doing the best at short notice. Subsequent experiments showed, however, that the results were closely correct, and therefore gave confidence in the method.

Need of Greater Sensitiveness.

Consideration, however, showed that better results and greater accuracy would be secured by making the instrument more sensitive. This would also adapt it for obtaining results on lower capacities. I will not detail the steps by which this was gradually accomplished, but at the end of 1909 I had constructed a workable instrument with a constant of from ten to twelve, or, say, ten times as sensitive as the one already mentioned and about thirty times that of the Kelvin instrument. With 100 V on the needle, one could get now a deflection of 100 to 120 mm. under the above conditions, with 1/10 V drop between the quadrants at unity power factor. At the same time good coincidence of the electrical and mechanical zeros was attainable. As this instrument was sufficiently sensitive for the work on dielectrics I was contemplating, I left the matter, effecting detail improvements from time to time, until the war put an end to experimental work.

Recent Results.

Within the last year I have had a new set of instruments built embodying a number of further desirable points and taking advantage of some improvements in drawing fine metal strips. The result is that I have now for some months been using a workable instrument with good control of the electrical and mechanical zeros which has a constant of over 40, or with 100 V on the needle and 1/10 V between the quadrants gives a deflection of over 400 mm. at 2 meters at unity power factor. This is on a par with the sensitiveness of the Dolzalek instrument using a quartz fibre suspension and with a fixed charge on the needle. The period under these circumstances is rather long, but the instrument is nearly dead beat, and easily workable for experimental purposes. Such sensitiveness is, however, seldom necessary, and therefore I shall only assume a constant of about half this.

Theory of the Instruments.

The simple form of Maxwell's equation,

$$\theta = VV_1 - \frac{V_1^2}{2}$$

which is used in practice is readily turned into :

$$W = \frac{1}{R}\left(\frac{\theta}{L} - \frac{C^2R}{2}\right)$$

Where W = watts expended in circuit, θ deflection. L inst.

constant, R = ohms in series non-inductive resistance and $\frac{C^2R}{2}$ = loss in half series resistance. This is for an instrument directly coupled across the circuit.

The position for very low power factors can be seen by taking the limiting case that W, or the watts expended in the condenser, = O which can be very nearly attained practically with the highest class of air condensers kept in a dry atmosphere.

For simplicity take R as 1 O, we then get :

$$\theta = \frac{1}{1}\left(\frac{\theta}{L} - \frac{C^2R}{2}\right)$$

From which

$$\frac{\theta}{L} = \frac{C^2R}{2}$$

Or there is still a plus deflection, but it is due to the equivalent of the loss in half the series resistance being included in the measurement under all circumstances.

Let us consider what this means from a practical point of view with an instrument with a constant of 20, an alternating circuit P.D. of 100 V on the object on which the measurement is to be made, and assuming the current through R is 1 A and its resistance 1 O, or there is 1 V drop between the quadrants, the instrument being directly coupled across the circuit.

At unity power factor the loss in such a circuit with 1 A flowing and 100 O across the circuit measured would be 100 W plus 0·5 W for the loss in half the series R, and the instrument would give a deflection of $100 \times 20 \times 1 = 2\,000$ mm. plus 10 mm. for the loss in half the series resistance.

Action with Perfect Condenser.

But if a condenser *without loss* instead of the resistance is now substituted across the circuit, still taking the same current, the charge will equal the discharge, and the two opposite forces impressed on the needle owing to the capacity effect balance. The only deflection which results is now due to the loss in half the series resistance, which is 10°, and this deflection evidently is equivalent to the loss due to 0·5 of 1 per cent. power factor.

Suppose we now assume our condenser itself has a power factor of only 0·1 of 1 per cent. or a loss of 1 part in 1 000. The deflection of the instrument will be due to 0·5 per cent. plus 0·1 per cent. or 0·6 per cent. power factor, and will be increased by $\frac{10}{5} = 2°$ or to 12 mm. This means that out of the total deflection obtained 5 parts are due to the loss in half the series resistance, and 1 to the loss in the condenser itself.

Assuming that we can read to $\frac{1}{4}$ mm. on the scale, we should be able to read the power factor of 0·1 per cent. to about 10 per cent. accuracy, everything else being taken as equal, but there is the difficulty that under these conditions the current flowing must be measured separately ; we are therefore on the verge of what we can do with such a power factor.

Effect of Varying Condenser Losses.

Suppose, however, the loss in the condenser is 0·2 per cent. instead of 0·1 per cent., we should get now 4 mm. deflection for this, while the loss in the series resistance would remain the same, we have therefore doubled the deflection for the condenser loss, and at the same time reduced the ratio of the condenser loss to that in half the series resistance to one half. We might now with a little care measure such an actual condenser loss of 0·2 of 1 per cent. and take the power factor found as, say, between 0·215 per cent. and 0·185 per cent.

Every increment of 0·1 per cent. in the condenser loss makes the position correspondingly better. At 0·5 per cent. power factor the loss in the condenser becomes equal to the loss in half the series resistance, and the deflection is 10 mm. for each of these factors, or 20° actually. Now, outside a very narrow range of conditions, in practice 0·5 per cent. is a very low power factor indeed. I have dealt with the above conditions at some length because they also cover the conditions under which zero methods must work. In these we balance out the deflections and read the results in terms of resistances.

Improved Working Conditions.

We will now consider what possibilities are open for improving the working conditions. The most obvious is to increase the drop across the series resistance. This is what Mr. Parry did in describing his zero method ; he increased the drop to about 2·5 V. This increases all the deflections proportionately. It still, however, leaves the ratio of the loss in half the series resistance to the loss in the condenser the same.

There is, however, another alteration we can make. We can raise the P.D. on the needle to 200 V. The instrument mentioned above will stand this for approximately the same constant—200 V is a very convenient voltage for this class of work.

This, if everything else is left the same, doubles the current and increases the condenser and series resistance losses four times, and consequently the deflection. We can, however, reduce the series resistance to half, which will still leave us with double the deflection we had before for the loss in the condenser, but the deflection for the loss in the series resistance alone will now be the same, so that we have reduced the ratio of the two to one half.

Assuming that under these conditions, viz., with 200 V on the needle and 2 V between the quadrants, we now examine the figures, it will be seen that at 0·1 per cent. power factor, while we shall get 20° deflection for the loss in half the series resistance, we shall now get 8° deflection for the loss in the condenser. We should now with care be able to get results for a power factor of 0·1 per cent. within something of the order of 5 per cent. accuracy.

Higher Voltage and Constants.

It is also possible to go further in the direction of raising the voltage on the needle without proportionately reducing the constant, the quadrants being set further apart. Again, I have mentioned that it is possible to get a higher constant on the instrument than has been assumed above, which enables the proportionate drop across the series resistance to be still further reduced.

I think, therefore, it is not going too far to say that with a sufficiently sensitive electrostatic wattmeter, directly coupled across the circuit, under conditions which can be reproduced practically, it is possible to measure power factors of 0·1 per cent. to an accuracy of less than 10 per cent., and that for each 1/10th of 0·1 per cent above this, the accuracy and facility of making measurements increases almost as the square of the power factor.

Having gone so far, it is desirable to turn to other sides of the question, but before doing so I would add that it is assumed that a fairly good wave form is used. Also, if the capacities are very small and high series non-induction resistances must be used, the loss in the leads connecting and operating switches, mostly surface leakages, become a factor to be reckoned with, particularly in damp weather.

Measurable Capacities.

I have been able to get results of value on capacities down to 1/1000 m.f. working on a 100 V circuit at 50 periods and down to power factors of the order of 0·1 per cent., but the ease and certainty with which one works rapidly increase as both the circuit P.D. and the capacity are increased.

The capacities met with in testing 6 in. sheets of thin dielectrics are much in excess of this, while outside a very small range of dielectrics, power factors under 1·5 to 2 per cent. are rarely met with. Many materials are used for insulation and other purposes for physical apparatus, and in engineering, the power factors of which range from the above to 5, 10, 20 or even 80 per cent. For instance, high pressure paper oil cables have usually power factors not much under 2 per cent. The condensers used for correcting power factors in motors are guaranteed as having power factors something under 0·5 per cent., but outside these and air and standard mica condensers one seldom meets with these very low power factors in practice. The real question is to have

a relatively simple reliable method of reasonable accuracy to attack all the problems met with in these materials under the different conditions under which they are employed in science and in practice.

Low P.F. Measurements with Shunt of Two Ratio.

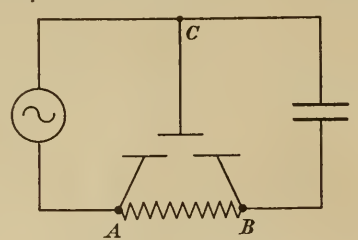
Returning, however, to our subject, for very low power factor measurement there is a second method of proceeding, viz., to employ a shunt across the circuit and connect the wattmeter needle to the middle point. The actions occurring then balance out the loss in half the series resistance, and the instrument readings give directly the loss in the condenser or other apparatus tested alone.

The possibility of doing this was first pointed out by Dr. Russell in the memorandum he sent me after seeing the experiments mentioned at the beginning of this Paper. I mentioned it in my ELECTRICIAN articles of 1901, and have made a practice of using it since for measurements of less than 0·5 per cent. power factor. At the same time Dr. Russell pointed out that this was an advantageous method of using a shunt, as it would be symmetrical if properly constructed. These direct readings can now, by the help of Dr. Owen's extension of Mr. Parry's suggestion, be turned into zero readings if required.

Theoretically we can also now increase the drop across the series resistance as much as we like, but in doing this to a very considerable degree another question arises which was raised in the debate on Mr. Parry's Paper, and which I am inclined to think is the really fundamental one in the working of the electrostatic wattmeter at very low power factors.

Action of Instrument.

In the view of the physical actions occurring in the instrument which I have always taken, it must, as Mr. Parry also stated in his Paper, be looked on as two separate instruments in one when used on low power factors. Take the case when



CASE OF CONDENSER WITH NO POWER FACTOR.

the condenser has no power factor. The greatest difference of potential between A and B (see Fig.) will occur when there is no E.M.F. in the generator circuit, consequently C is short circuited to A, and the instrument is connected as a voltmeter across A B with half the heterostatic constant and the maximum current flowing in A B. Now the voltage across A B on the basis $\frac{E^2}{R}$ measures the watt loss in A B if it is non-inductive or if we use the heterostatic constant of the instrument the watt loss in half A B. The deflection in the diagram above for this will be to the right, while any deflection as a wattmeter due to loss is to the left (the leads are crossed in practice).

The actual deflection of the needle is due to the resultant of these two opposite torques. That is, the deflection is proportionately less than the watts expended in the condenser and the series resistance by $\frac{V_1^2}{2}$ the physical effect of this being in the negative direction.

Effect of Doubled Voltage.

Taking the action with a shunt of 2. Doubling the voltage under these circumstances does not increase the potential on the needle, but doubles the current through the series resistance. This increases the wattmeter plus deflection corresponding to the actual loss in the resistance to double, but it increases the minus deflection due to the $\frac{V_1^2}{2}$ component four times. The result is that in this case the positive deflection for the loss in the series resistance is exactly balanced by the negative deflection due to the voltmeter action and the actual needle deflection is due to the loss in the condenser alone.

With higher values than 2 of the shunt, if the loss in the condenser is nothing or very small, we now begin to get negative readings, increasing as the multiplying power of the shunt is increased until finally in the limit the deflection is due to the voltmeter action alone and is in the minus direction.

Take the formula I have found most convenient for such readings :—

$$W=\frac{N}{R}\left\{\frac{\theta}{L}+A^2\left(\frac{1}{2}-\frac{1}{N}\right)\right\}$$

Where W = watts expended in condensers. N = value of shunt. θ = deflection. L = heterostatic constant. A^2 = square of volts drop across series resistance.

We can write :—

$$\frac{WR}{N}=\left\{\frac{\theta}{L}+A^2\left(\frac{1}{2}-\frac{1}{N}\right)\right\}$$

Assume that $W=O$ then $\frac{WR}{N}=O$.

Consequently $$\frac{\theta}{L}=-A^2\left(\frac{1}{2}-\frac{1}{N}\right)$$

Take for example $L=20$, $A=3$ or $A^2=9$, $N=20$

$$\frac{\theta}{20}=-\frac{9}{2}+\frac{9}{20}$$

$$\theta=-81.$$

The full minus deflection apart from the component of the loss in the series resistance included would be $\frac{9\times 20}{2}=-90$.

Useful Preliminary Calculations.

I find this method of looking at the actions occurring physically convenient, as it enables one to calculate beforehand the approximate deflections which will be obtained under any given set of conditions. For this purpose I first assume what the loss in the circuit would be at unity power factor with a given convenient series resistance and current. For low power factors the loss will be directly proportional to the power factor; say, for 1 per cent. power factor we divide the loss at unity power factor by 100 and take the result as our watts in the above equation. Knowing the constant of the instrument, we can then take different values of the drop in the series resistance and find what drop will give, on the whole, the best result with any given sensitiveness of the instrument.

Basis of the Instrument's Action.

Assuming that this view of the actions is sound, the ultimate correctness of the instrument seems to depend on whether the torque due to an E.M.F. generated by the current alone can under all conditions which may practicably arise be correctly balanced against a torque dependent on the same current, but multiplied into the pressure across the circuit.

As regards this it is clear that we have not to do with instantaneous effects, but to the integrated effects over a whole cycle in each case ; as far as I can see, the two will always be directly proportional, and can therefore be correctly balanced against each other, so long as the conditions of symmetry are not too far departed from and the deflections are moderate.

A Zero Method.

Assuming that this is so, it will be seen that when shunts of a value higher than 2 are employed we are really balancing the loss in half the series resistance multiplied by N against the loss in the condenser as far as it will go, and by suitably adjusting the series resistance a complete balance can be obtained resulting in a zero reading.

Practically this can be done under good working conditions for power factors of, say, 0·5 of 1 per cent. to about 3 per cent., which it happens are the power factors met with in cables and over a wide range of the higher class of dielectrics.

It will be seen that under these circumstances a balance can be secured under very perfect conditions; we balance the loss in the condenser against the loss in a non-inductive resistance in series with it, the same current acting on both. The value of this resistance will be accurately known, and the current flowing in it can be measured to less than half of 1 per cent. accuracy. No extra apparatus is needed and the same arrangement permits results being got either on the basis of actual deflections or by balancing out to zero. The constant of the instrument as a wattmeter is easily and quickly obtained under working conditions and remains substantially the same for long periods, but obviously when using the zero method this is eliminated.

The Instrument as an Ammeter.

Again, as regards measuring the current, with a constant of 20, the wattmeter with the needle short circuited to one of the quadrants becomes a voltmeter with a constant of 10, the deflection increasing as the square of the voltage. Consequently a drop of 2 V will give a reading for the current in the series resistance of 40 mm. and 3 V drop a reading of 90 mm., these deflections altering as the squares are easily read to less than 1 per cent. The wattmeter may, therefore, be also thus used as an ammeter, without alteration of the arrangements, for measuring the circuit current, and therefore the single instrument will give all the necessary data for calculating power factors and measuring capacities as well as actual losses. For careful measurements of capacities I have, however, found it better to supplement this arrangement by putting a throw over switch in the testing leads, and balancing the capacity current into the dielectric tested against the same current into a set of standard variable condensers. This gets rid of the difficulty of wave form, and the capacity to a close degree of accuracy can be read off the variable capacity directly and without correction up to power factors of say 8 per cent.

The Electrometer To-day.

The instrument is now really what used to be called a mathematical instrument rather than an ordinary electrical instrument. The principles in its modern construction have much affinity to those needed in the chemical balance. In fact, it is a very delicate and accurate torsion balance for weighing the difference of two electrical pulls in place of two gravitational pulls.

To measure a power factor of 0·1 per cent. we are measuring 1/1 000th of the forces operating in the circuit. Suppose we can measure this 0·1 per cent. power factor to 5 per cent. accuracy, we are measuring the difference in these forces to 1 part in 20 000, and this while these forces are alternating at say, 50 ~, or there are 200 charges and discharges per second. Looking at the matter from a thermodynamic point of view, we have in the charge and discharge of a high class condenser probably the most perfect reversible action in nature.

Applications of the Instrument.

In what I have said above I have dealt with the most difficult work to which the instrument can be put, viz., the losses in high class condensers. But it is equally applicable to the measurement of induction. For instance, suppose we take an air core transformer wound on the best principles, the lowest loss which can be got in such a case, owing to the resistance of the copper, is about 2 per cent. at ordinary frequencies. If we put in iron we can reduce the copper loss to very small proportions, but instead we have the iron losses, and it is very difficult to keep the losses even in large transformers below 2 per cent. on open circuit. Consequently working on circuits having inductance no power factors less than about 2 per cent. are met with under ordinary circumstances, and what has been said above regarding condensers of 2 per cent. power factors applies here also.

Reviews.

Experimental Wireless Stations. By Philip E. Edelman, E.E. (London: Henry Froude and Hodder & Stoughton). Pp. 392. 16s. net.

It may be a little harsh to say that this volume is superfluous, but nevertheless, there is nothing in the book which has not been said before, and said a great deal better, The author, though no doubt widely-read, betrays every now and again an imperfect grasp of his subject and an ignorance of relative values which is thrown into relief by his occasional attitude of authority and almost patronage.

The result of an attempt to cover nearly all branches of wireless is that many sections are very briefly described and often consist of three lines and a diagram. Chapter I. gives an account of the nature of wireless transmission. This account is weak in parts and hopeless in others, as when discussing the "condenser theory of propagation," and the Heaviside layer theory. On p. 18 we are told that the condenser formed by the two aerials becomes leaky when it rains, and that this is why signals are worst in wet weather (a questionable fact).

The second chapter brings us to aerials. Local telephone or light companies are given a very good character, for not only do they allow you to use their poles but some "will even give aid if properly approached." The touching spectacle of a Post Office lineman "giving aid" would soften the hardest heart.

Chapter XII. contains descriptions of arcs, high-frequency alternators, &c. Chapter XIV. deals with valves. The Fig. 74 circuit for obtaining curves shows the milliammeter A measuring not only the anode current but also the current through the anode voltmeter. Fig. 84 shows a collection of miscellaneous valve circuits. Circuits VII. should show the telephones in the anode circuit of the last valve in place of R. Grid leaks are omitted in all circuits. Fig. 90 omits a connection between B and the line beneath it.

The author states: "A crystal will even detect signals from arc and undamped wave sets under favourable conditions. The author has heard such signals when using a detector in a receiving circuit containing a variometer coupler, which caused the necessary reaction in the circuits." Comment would be superfluous.

Chapter XV. brings us to radio-telephones. Fig. 101 shows a valve transmitter in which the power is taken from the grid oscillatory circuit instead of from the anode circuit.

The U.S. Army set of Fig. 108 is reproduced incorrectly. The battery in the grid circuit of the oscillator is in an ineffectual position. The anode battery is shorted and a condenser should appear between the anode of the oscillating tube and the aerial inductance.

Chapter XIX. shows a number of crystal circuits. Fig. 131 will not work as the potentials across L and C will neutralise each other. The other circuits show the telephones directly across the crystal. In Figs. 133 and 134 the telephones should be across C. Fig. 136 is impossible. The detector is directly shorted. Fig. 137 is worse if anything, the detector being shorted and the telephone circuit being open.

While there is much matter in the book, there is little which is deserving of praise, and the recurrent fault, apart from multitudinous inaccuracies, is that everything is so sketchily described as to render it almost valueless.

John Scott-Taggart.

Lexique Technique Anglais-Francais. By G. Malgorn. (Paris: Gauthier Villars et Cie.) Pp. xxi. + 216. 10 francs.

This book, the publishers' announcement tells us, fulfils a real want as the best English and French dictionaries do not translate sufficiently well technical words and expressions. This, of course, is the case, but there are now on the market a large number of technical dictionaries which do fulfil this want as far as it ever can be fulfilled. Every technical dictionary is at best but a guide, and the translator's experience must be the final court of appeal. Within these limits the book may be recommended and seems to contain exceedingly few mistakes or weaknesses. We notice that no translation is given of the terms gasfilled, zigzag transformer, nor phase advancer, but perhaps we are asking too much for ten francs.

Auxiliary Features in Automatic Telephone Systems.*

By W. AITKEN, M.I.E.E.

Branch Offices Calling Locally without Utilising a Trunk to the Main Office.

The method of operating branch, satellite, and other small offices in connection with a multi-office system is an interesting problem. It is not considered expedient to place a first selector at a small office with another first selector at the main office, as this would mean an extra digit as a prefix for the numbers appertaining to the small office. Usually the trunks are connected to the second selectors at the main office, but this necessitates, when the calling and the called parties are in the same small office, that two trunks are used between the small and the main office. This may mean that the equipment is expensive.

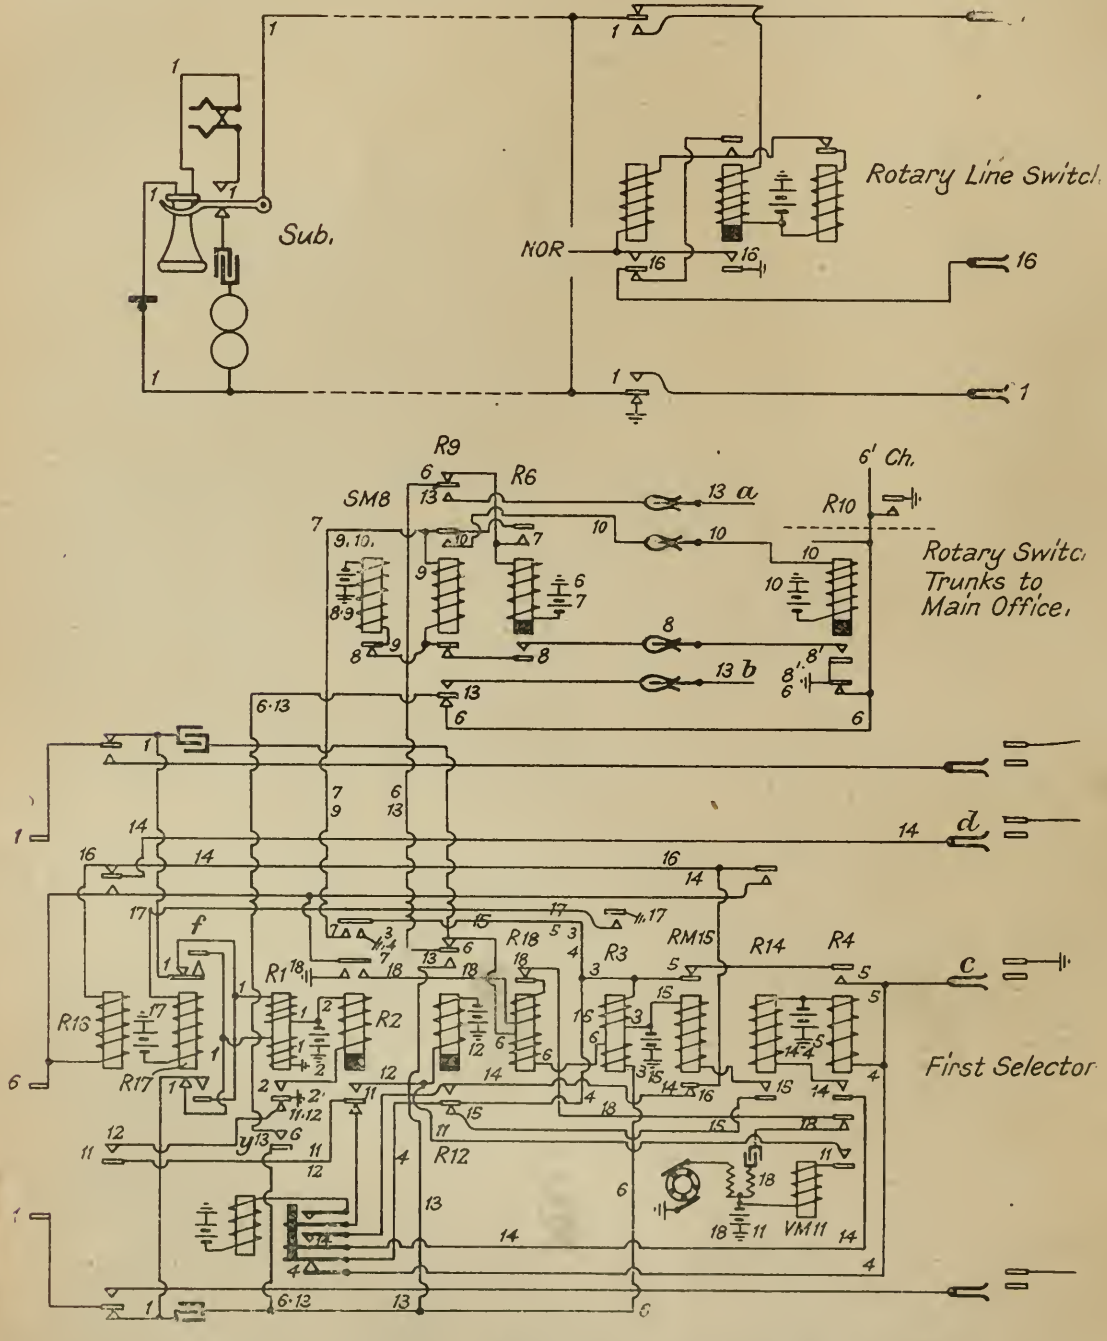
Several devices have been suggested to render the use of main office trunk in a local call unnecessary, and the diagram shows one of the Automatic Telephone Manufacturing Company's methods of achieving this end.

A rotary switch is used in combination with a selector at the branch office. The operation of the rotary line switch shown in the diagram is assumed to be known.

On lifting the receiver the calling line is extended to the selector and the rotary switch selects an idle trunk to the main office. The impulses of the first digit operate the selector shown and also a first selector at the main office. In the latter case, if the level to which the wipers are raised corresponds to a branch office number the terminals will be "dead," and the trunk is at once released and succeeding impulses are received on a selector and connector in the branch office over a local circuit.

If the level first selected corresponds to a main office number the selector shown takes a single rotary step only and subsequently acts as a repeater to repeat the remaining impulses Busy tone is given if all the trunks to the main office are busy.

The rotary switch has no normal position, and is arranged to take a step forward when released so that, should a caller have been connected with a faulty line he can, by replacing the receiver momentarily, immediately connect with another idle trunk.



PBx Calling Locally without using Trunks through Central. A. T. M. Co.

The circuits on a local call are as follows :—

1. When the receiver is lifted the caller is extended to a selector in known manner and R1 energises.
2. R2 (guard) energises.
3. Polarising circuit of R3 (this is neutralised by circuit 6).
4. R4 energises.
5. R4 locking circuit.
6. R6 energises (line relay of rotary switch).
7. R6 locking circuit.
8. Rotary switch stepping magnet SMS connected to test wiper. The rotary switch advances until it finds an unearthed test terminal of an idle trunk. R9 has been short-circuited over circuit 8.
9. R9 energises, opens circuit 6 and R6 slowly de-energises.
10. R10 of an idle trunk energises and engages the trunk over a circuit 8 to earth. Earth is cut off the starting wire 6 of the group of rotary switches. Earth remains connected at some other point while a trunk to the main office is idle.
11. The vertical magnet VM11 is energised on the 1st series of impulses.
12. R12 energises in parallel with VM11.

The windings of R3 and R18 in circuit 6 are short-circuited to give the impulses a clear path to trunk over *a* and *b*.

13. Impulse circuit to trunk referred to above.

After the impulses R12 de-energises. The rotary relay R14 and rotary magnet RM15 co-operate in known manner to rotate the wipers.

14. If the first trunk is busy R14 energises.

15. RM15 energises and the wipers take one step. Circuit 14 is open and R14 de-energises.

Circuit 15 is open and RM15 de-energises, and so on. At the first energisation of RM15, circuit 5 is opened, but R4 remains energised over the wiper *c*. All the terminals are earthed on the levels serving the second selectors of the branch office.

16. When the test wiper *d* reaches the unearthed terminal of an idle trunk the switching relay R16 energises (maintained in series with R14 which does not energise), and opens circuit 1 so that R1 de-energises, then R2, R6, R9 and R10 de-energise. In the interval between the de-energisation of the last three relays, earth, over circuit 8, is connected to M8 to step the wipers to the next trunk.

A Call to the Main Office.

The operations are similar to those described up to the point where the selector shown takes its first rotary step. R4 then de-energises because all the terminals corresponding to main office connections are blank. R14 circuit is open at R4. R16 circuit is also open and the rotary movement is brought to a stop at once. Relay R1 is in circuit so that succeeding impulses are repeated at contact *y* (circuit 13) over the trunk *a*, *b*.

17. When the call is completed and answered the reversal of current in the trunk *a*, *b*, causes the polarised relay R3 to energise, because the currents in the two circuits now assist each other instead of neutralising. R17 then energises and reverses the current to the calling station.

Busy Signal when all Trunks are Busy.

If all trunks to the main office are busy no earth is connected to the wire *Ch* and no circuit 6 completed when R1 is energised. The switch is not set in motion.

18. When R4 de-energises busy tone is through R18, which vibrates and induces a tone in the lower winding.

An Electrically Controlled Bascule Bridge.

An interesting example of the application of the electric drive to such heavy and intermittent work as bridge operation, is to be found in the bascule bridge which has recently been installed at the King George V. Dock, North Woolwich, by the Port of London Authority. A good deal could be written about the advantages of electrical operation for this class of work, but we may confine ourselves to a description of the control gear, which contains some unusual details owing to the fact that the bridge is designed for automatic working.

The contractors for the bridge, which is shown in Fig. 1, were Sir Wm. Arrol Company, Ltd. All the control gear for opening and closing the locking bolts, the main leaves of the bridge, and for operating all the auxiliary motors, was supplied by Electric Control Ltd. All these operations are carried out from one position by means of master controllers in the control tower built beside the bridge.

The two leaves of the bridge are driven independently, two motors being employed in each case. These operate through dog clutches and suitable reduction gearing. The motors are mounted two on each side of the waterway, and one contactor controller on each side operates the two motors and also controls the electrically operated brakes for holding the bridge in any definite position. The locking bolts are operated by reversible motors mounted adjacent to the bolts in the bridge leaves, each motor being controlled separately by the master controller in the control tower, which operates contactor controllers installed in the motor room below the bridge. The motors which drive the pumps for supplying oil to the main bearings and the sump pumps for the bridge, are also operated from switches on the main supply panel in the control tower.

The electricity supply is taken from the mains through a meter and fuses to the main supply panel. This panel has mounted on it distribution switches and fuses for the various power and lighting circuits, and overload protection relays and regulators for the sump motors. A set of indicating meters for current and volts and water levels are fixed in a convenient position on this board.

The Master Controller.

The master controller (Fig. 2) is fixed so that the operator can control all the operations from one position, in which position he has full view of the whole bridge and waterway. He can also, from the same position, follow the operations from the indicating board.

Describing the operations in the usual sequence in which they occur, the operator after energising the main distributing panel by closing the supply switch starts up the motors driving the oil pumps. By operating the master controller for the bolt motors he switches them on to the line, one after the other, through a buffer resistance. The motors, it may be added, are stopped automatically by the withdrawal of the bolt (see Fig. 3). This latter action is accomplished by a tappet switch which is fixed alongside the motor and operates a tappet on the bolt (see Fig. 4). The tappet switches at the same time reverse the connections for the armatures of the motor, so that they are ready for starting up in the reverse direction by the master controller, when it is operated again. When the last bolt is withdrawn, and not before, the operator can operate the controllers for the main motors, as they are electrically interlocked with the controller for the bolt motors, and cannot be energised before they are all in position for the safe operation of the bridge. By operating the contactor controllers by means of the

Fig 1.—General View of Bascule Bridge, King George V. Dock.

master controllers the main motor is started through a diverter resistance, which allows the motor to run at a very slow speed only. On the succeeding steps the speed is gradually increased, but the connections of the main controller are such that on each step of the

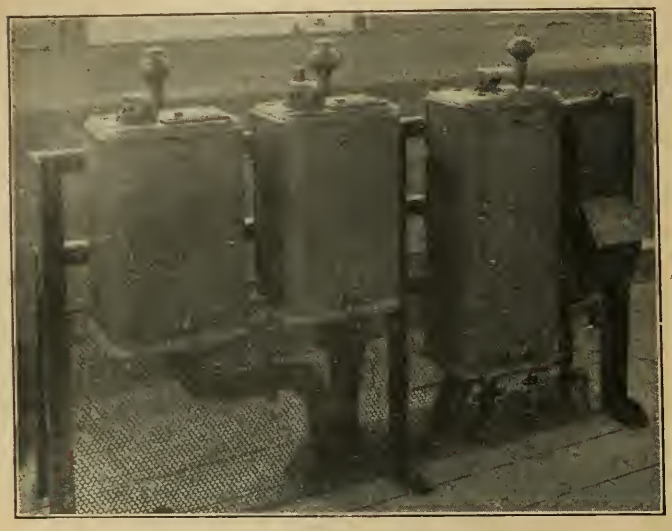


Fig. 2.—Master Controllers in Operating Cabin. Each of the small master controllers operates one of the contactor panels controlling two of the main motors. The larger master controller operates the contactor panel controlling the bolt motors.

master controller the motor will run at a fixed pre-determined speed, which is practically unaffected by the wind pressure on the bridge or other variations in the load.

Operations on Closing.

When the bridge approaches its final open position, the control is automatically taken out of the operator's hands, the bridge being

Fig. 3.—Contactor Panel controlling the Bolt Motors, which are series wound reversible.

then controlled by tappet switches operated by the bridge leaves. These tappet switches automatically slow down the bridge to a very slow speed before it reaches the final position, and finally stop it, the brakes being applied independently of the operator. The operator can, however, perform the same operations and thus stop the bridge before it reaches its extreme position, but he has no means of delaying this operation beyond the pre-determined safe limit. When it is necessary to close the bridge again, the operator has full control over the motors and can accelerate them up to full speed independently of the position of the leaves. As soon as they approach the closed position the control is again taken out of the operator's hands and is effected automatically by the operation of other tappet switches, which first slow down the motion of the bridge to a pre-determined slow speed and then finally stop the motors and apply the brakes.

Having closed the bridge, the operator can then, but not before, operate the bolt motors and close the locking bolts. The bolt motors, as in the opening operation, stop automatically as soon as the bolts are closed, quite independently of the position of the master

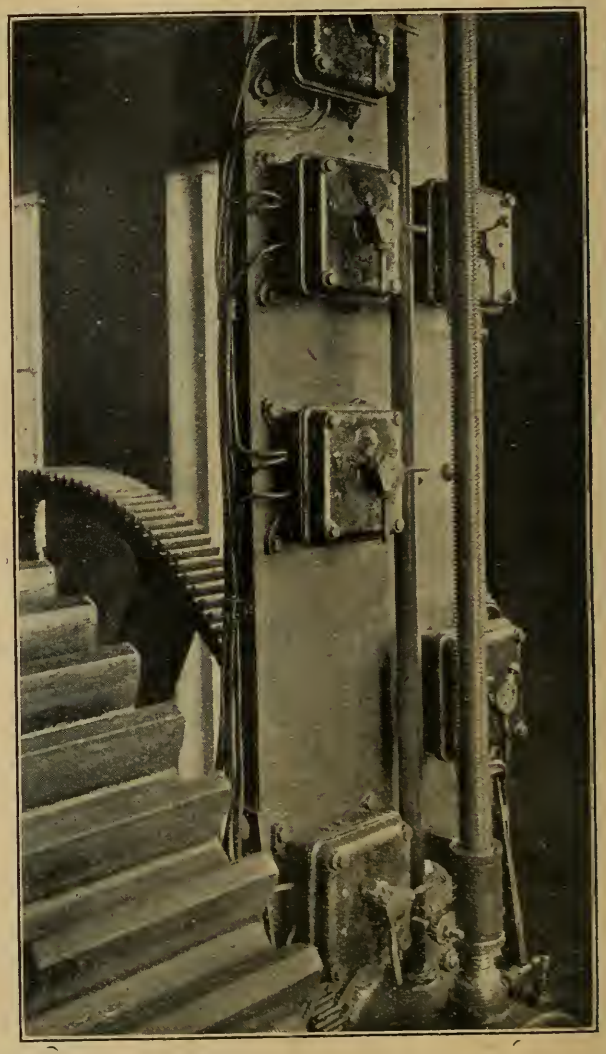

Fig. 4.—Limit Switches, showing operation by travelling screw tappet, which operates the switches in correct sequence according to position of bridge.

controller in the control room. The electrical interlocking is, therefore, so arranged that the operator cannot start the main motors before all the bolts are actually withdrawn, neither can he start closing the bolts before the bridge is completely closed and the main motors stopped.

Conditions at Night.

During the opening and closing of the bridge, the tappet switches also control indicating lamps on the indicating board in the control room, thereby enabling the operator to see the position of the bridge even in the dark. A special depth indicator is used in the control room for showing the water level in the recesses for receiving the counterweights and the tail ends of the leaves in their open position. This indicator is operated by a float and counterweight, which, through a chain, operates contacts for a voltmeter connected as in a potentiometer across a variable portion of a resistance which is permanently connected to the line. This meter is graduated directly in feet so that the operator can see at a glance the depth of the water and when he is required to start the sump pumps.

The Electrical Equipment of the D. R. Cotton Mills.

Modern Methods in Tyre Manufacture.

In an article by Mr. J. T. Randles, which appeared in the 1921 Textile Issue of THE ELECTRICIAN, a reference was made to the electrical equipment which was being installed in the D. R. Cotton Mills, Rochdale, of the Dunlop Rubber Company. Through the kindness of the ENGLISH ELECTRIC COMPANY we are now able to give some further illustrated particulars of this modern electro-textile installation.

These mills, which consist of both spinning and weaving sections, were built in 1914 to produce the fabric, &c., used in the manufacture

FIG. 1.—250 H.P. MOTOR DRIVING DOUBLING FRAMES.

of Dunlop tyres, and during the last two and a half years extensions considerably larger than the original mills have been added to meet the growing requirements of the company. Power is obtained from the Rochdale Corporation, the transmission pressure being 10 000 V (three-phase, 50 periods), and two transformer sub-stations, 10 000/400 V, are provided in suitable positions, one with an ultimate capacity of some 10 000 kVA, for supplying the spinning section and the other of rather smaller capacity for the weaving section. From the low-tension switchboards in these sub-stations three-phase feeder cables run to low-tension distributing switchboards of the ironclad industrial type.

The new spinning mill is a ring spinning and doubling mill of seven storeys, square in form, covering about three-and-a-quarter acres. The first flat or basement is arranged partly as a store and partly as a blowing room, the second flat as a doubling room, the third, fourth, fifth, and sixth flats as carding and spinning rooms and the seventh flat as a finishing room.

The Cable System.

Owing to the large power involved (some 9 000 H.P.), the satisfactory installation of the cables would have been a very difficult matter unless proper provision was made while the mill was being built; the cable system was, therefore, planned in detail, all fixings, conduits through walls, &c., being built in as the building proceeded. The final running of the cables was thus greatly facilitated, and masons' attendance, cutting away and making good, was reduced to a minimum.

For the main power feeders and distributors it was found convenient to use only three sizes of cable—0·3 sq. in., 0·2 sq. in., and 0·1 sq. in., all three-core; in the case of the feeders three or four 0·3 sq. in. cables were run in parallel in preference to using larger sizes, as above this size the permissible current density per sq. in. of area is considerably reduced and the cable becomes very unwieldy from the point of view of installation. Further, this arrangement permits any feeder to be conveniently duplicated in future if required. The cables are all paper-insulated, lead-covered and single-wire armoured, and the armouring is galvanized (left bright) and provided with a spiral binder wire to keep it in place during installation. This type of cable, it is claimed, is very suitable for use in cotton mills, as it is more easily kept clean and free from fluff than a served or braided cable, and it is unaffected by the fairly high temperature sometimes found in textile mills. The cable was manufactured and installed by Siemens Brothers & Company.

Sub-Stations.

The larger of the two sub-stations referred to above abuts on one of the staircase towers of the mill, and switchrooms for accommodating the distribution switchgear are incorporated in this tower, one switchroom being provided for each flat. One of the walls of the tower is utilised for carrying the main feeder cables from the sub-station to the various switchrooms. As these cables weigh nearly 30 lb. per yd. run each, it was necessary to provide secure means for supporting them in the vertical position, the vertical run in the case of the seventh flat being approximately 30 yds. To effect this a horizontal row of cast-iron bricks provided with T slots was built into the wall at suitable intervals, to which the cables were fixed by cast-iron clips. This construction has proved very satisfactory.

Distribution Methods.

The distributor cables which connect the various motors or groups of motors in the flats with the distribution switchgear in the switchrooms are carried on "Rigifix" fittings, to which the cable cleats are bolted. These were incorporated as required in the reinforced concrete floors of the switchrooms and under the staircases to the flats, while cast-iron conduits were provided for the passage of the cables through the mill walls where necessary. In the mill itself the cables are run on the ceilings of the flats, light beams bridging the lower flanges of the floor girders being provided to carry the cable cleats. Fig. 3 illustrates this method of supporting cable runs, which has obviously many advantages over the ordinary method of cutting holes and grouting in fixing bolts when the installation is a large one. A separate circuit is provided for every motor of 70 B.H.P. and upwards, corresponding to a line current of approximately 100 A or more. In the case of the 50 H.P. motors referred to below, a group of three motors is supplied from one distributor, the motors being connected to the cable through link boxes. Distribution boxes fitted with fuses are only used for supplying groups of the smallest motors, 20 H.P. and less.

Motor Design.

The motors installed in all the rooms except the basement are of the pipe-ventilated slip-ring type, fitted with brush lifting and short-circuiting gear, the drives being arranged on the group system. Broadly speaking, there are two systems which may be adopted when installing motors for group driving in a cotton mill: that of placing

FIG. 2.—A VIEW SHOWING ARRANGEMENT OF VENTILATING DUCTS.

the motors in a separate motor tower or corridor, and that of placing the motors on suitable elevated platforms inside the mill rooms. In the case of the D. R. Mills, owing to the size of the mill and consequently the number of shafts to be driven in each room, the former system was not suitable. It was found possible in adopting the latter system, however, to place all the motors adjacent to the walls of the mill, thus allowing the use of pipe-ventilated motors provided with ducts to draw cooling air from outside; this arrangement effectively avoids the disadvantages which follow

from placing open or protected-type motors in an atmosphere containing cotton fibre or fluff.

The Card Room Installation.

For the card rooms three standard sizes of motor were adopted, 50 H.P. for driving cards, 70 H.P. for driving roving frame shafts, and 150 H.P. for driving ring frame shafts ; in each card room there are six 50 H.P., four 70 H.P., and four 150 H.P. motors.

In the case of the roving frame and ring frame shafts, the motors are direct-coupled through flexible couplings and run at 485 revs. per min., but the card shafts are driven by laminated leather belts, the motors being of the three-bearing-bedplate type, running at 585 revs. per min.

Particular attention was given to the design of the motor supports to ensure satisfactory alignment between motor shafts and line shafting and also to enable any motor to be replaced as quickly as possible if necessary.

The motors were manufactured at the Bradford Works of the English Electric Company to their standard designs and are fitted with ball and roller bearings ; the flexible couplings, which are of the " pin " type, were also made by the same firm. The performance of these machines up to the present has more than justified the adoption of the type of motor and drive decided upon.

The control gear for each motor is mounted on the motor staging alongside its motor and consists of a triple-pole oil switch, interlocked with an oil-immersed metallic type rotor starter, the oil switch in every case being fitted with no-volt and three overload releases and ammeter. Push buttons for readily stopping any motor in case of emergency are provided at suitable points in the rooms.

The Doubling Room.

The equipment in the doubling room is similar to that described above, but the motors are each 250 H.P. and are fitted with ring oiling sleeve bearings.

Amongst the illustrations which show typical views of the installation, special mention may be made of Fig. 4, showing the individual drive system applied to a doubling frame, one of a number

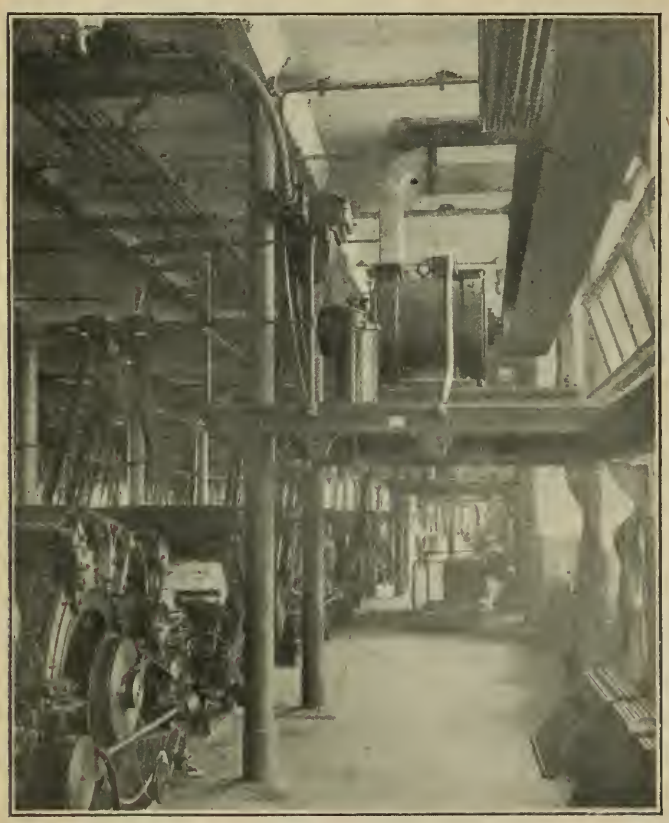

FIG. 3.—50 H.P. 3-BEARING TYPE MOTOR DRIVING CARDING ENGINES. ONE OF 24.

so equipped in one of the weaving sections. These motors are of the squirrel-cage type, specially designed for large pull-out torque, and drive the frames through clutch couplings.

The photographs of motors in the spinning mill were taken very shortly after erection was completed, and in the case of the 250 B.H.P. motor, Fig. 1, ventilating ducts had not been fitted, and the hand-railing, &c., on some of the motor stagings was not quite completed. Fig. 2 and Fig. 3, however, clearly show the arrangement of the ventilating ducts, the 50 H.P. motors being arranged to discharge their cooling air into the room and the larger motors being provided with an outlet duct in which suitable provision is made for discharging into the room when required, so that the warm air from the motors may be utilised in the cold weather to assist in the heating of the mill.

In conclusion, it may be said that the design of this mill would have been impracticable but for the electric drive. The mill shows

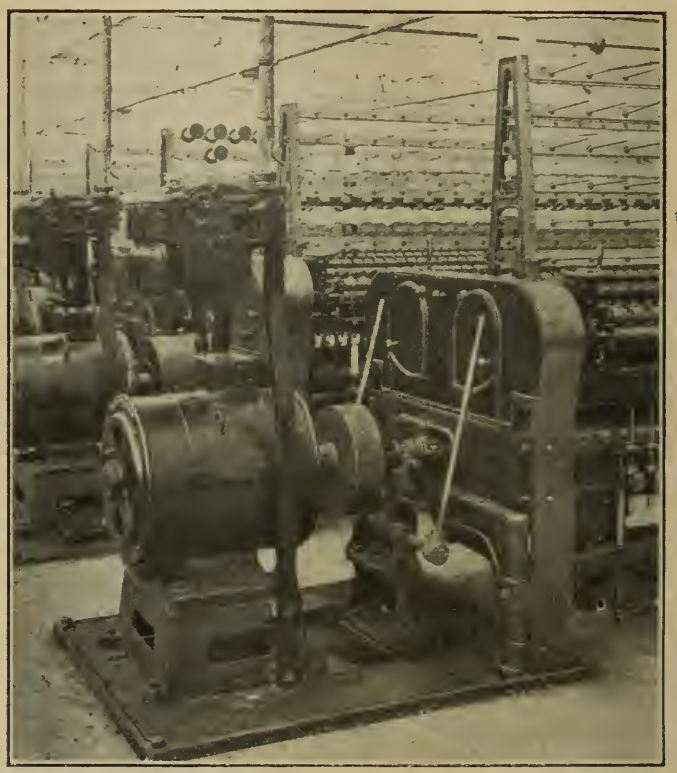

FIG. 4.—10 H.P. MOTOR DRIVING DOUBLING FRAME THROUGH CLUTCH COUPLING.

very decided advances upon the usual design of mill for ring spinning, and by incorporating electrical driving in the original design it has been possible to take full advantage of the facilities obtained by the use of electricity in a manner which can rarely be achieved when converting to electrical drive a mill originally built for mechanical drive.

Electric Traction in Italy.

To mark the holding of the ninth Congress of the INTERNATIONAL RAILWAY ASSOCIATION at Rome this week, the " Railway Gazette " has issued a special Italian Railway number, printed in English and Italian in parallel columns and forming a complete account of the history, development, and technical progress of the railway system in that country. The issue is excellently illustrated with a number of typical views on Italian railways, among which we are glad to see several of electrical interest.

One of the main articles is devoted to the electrification of the Italian railways, it being recalled that attempts to use electric traction date back to 1899, when experiments in the haulage of trains fitted with accumulators were made on the Bologna-San Felice and Milan-Monza lines, with direct current on the third-rail system on the Milan-Varese line, and with overhead wire on the Valtellina lines. As is well known, the overhead system has been generally adopted, and there are now 683 km of State railway electric lines, mainly double track.

Electric Traction and Coal Economy.

It is estimated that during and since the war the use of electric railways has saved a million tons of coal, and it is therefore not surprising to find that an extensive electrification programme is foreshadowed, and that about 5 116 km will be so worked by 1926. The lines selected for electrification are those with the heaviest traffic, though the necessity for an organic and continuous system has been borne in mind. Taking the existing figures for coal consumption, it is estimated by the electrification of less than one-third of the State lines it will be possible to effect a saving of two-thirds of the coal necessary for steam locomotion. This, of course, is due to the fact that the electrical energy is practically entirely obtained from water-power stations.

It is noted that there are difficulties in obtaining electrical equipment, which cannot be produced in sufficient quantities by Italian manufacturers, and the Government does not allow the railways to place contracts abroad.

The Automatic Control of D.C. Motors.

For certain classes of electric drive the advantages of automatic in place of hand control, need very little emphasis. For instance a pump may be started and stopped according to the level of water in a tank entirely without supervision and without the possibility of the motor running a moment longer than is necessary. For other applications, as for example the control of machine tools, a certain amount of personal attention—limited to the pressing of one or more push buttons—becomes necessary. The benefits derived from automatic control are, however, no less important. In the first place, the automatic system is mistake-proof; that is, it is impossible, owing to carelessness on the part of the operator, for either he starter or the motor to become damaged. The corollary of this is that the operator is freed from any responsibility for operating in a specified manner an apparatus which he does not understand, and is thus able to devote himself more completely to the task in hand, with beneficial effects upon the output. Moreover, the operations of starting and stopping are so easy that, although the possibility remains, he is seldom tempted to leave the motor running unnecessarily and so to waste current. Then, again, automatic control allows the use of push buttons at the working position, *i.e.*, all waste movement is avoided. The actual control panel, on the other hand, may be placed in any out of the way corner with increased safety to itself and a saving of valuable space round the machines.

So much for general features; in the present article is described a novel form of automatic starter made up with circuit breaker and isolator in an ironclad panel as illustrated in Fig. 1. The general form of the panel is that employed with the hand-operated control gear manufactured by Brook Hirst & Co., the only difference being in the starter. But the design of the latter constitutes, it is claimed, a marked departure from existing practice both in the movement and the timing.

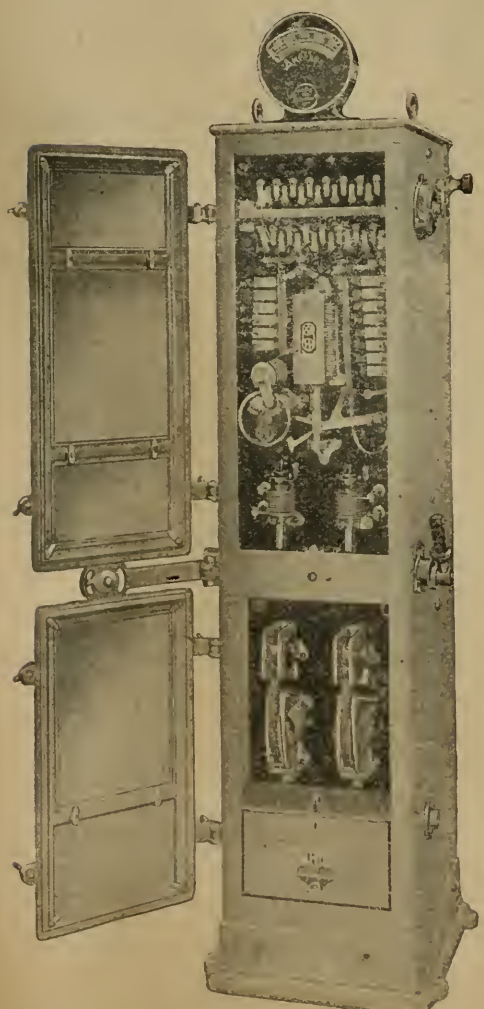

Fig. 1.—Solenoid Type Variable Speed Panel (Automatic Acceleration), with Ammeter, in Pillar Type Case.

Design of the Movement.

To appreciate the value of the first of these features it is necessary to have in mind existing automatic starter movements. These fall broadly into two classes, the sliding contact type and the contactor type. The first of these comprises the face plate, cross head and other forms of starter in which a single solenoid causes a moving bar or its equivalent to slide over the surface of a number of fixed contacts. This design has the advantage of providing a large number of starting steps in a comparatively simple and inexpensive form. On the other hand, owing to the sliding movement, there is a tendency for the contacts to become pitted. With the contactor type of starter, the provision of a separate electrically operated contactor for each step tends to limit the number of steps and may possibly involve unduly high current peaks. The butt contact whose employment is possible with this design is, in most respects, ideal, and when the initial contact is followed, as it usually is, by a sliding and self-cleaning movement, the pitting of the contacts is negligible.

The Solenoid Type Starter.
